D'Holbach, however, was just as aware as Diderot of the implications for morality of the denial of human freedom, and it is in truth misleading in both their cases to consider their scientific materialism and determinism separately from their moral and political thought. However great the interest of both these thinkers in science, their principal preoccupations were with man as a moral and social being, and this, rather than on scientific grounds, was why they were hostile to Christianity. Both of them saw Christianity as fundamentally anti-human and therefore as a force for social evil, and their materialist-based atheism was as much a consequence of this hostility as a cause of it. The priorities shared by Diderot and d'Holbach were in fact characteristic of the French Enlightenment in general. The move towards a greater understanding of the universe triggered by the discoveries of Newton, the development of a scientific approach to the understanding of human psychology stemming mainly from Locke, the enormous strides that were being made in the understanding of the animal world due to the work of Buffon and other contemporary naturalists and scientists, all this led to a new and exciting vision of the world, in which authority (especially that of religion) no longer held sway and every territory was available for exploration. But once the old certainties were dethroned, frightening possibilities were laid bare, and to thinkers who were above all anthropocentric in their concerns, it might well seem that there were far more pressing matters to be examined than, for example, the structure of the universe, the differences between animate and inanimate matter, or even the origin of life. It had become essential to re-examine the very fundamentals of human life, the nature of morality and the rules governing human behaviour and social organization, and it is to the discussion of these that the next chapter is principally devoted.

CHAPTER 10
The French Enlightenment II: deism, morality and politics

Peter Jimack

One of the most striking features of the French Enlightenment was its hostility to Christianity, especially as represented by the Catholic Church, a hostility which went far beyond the mere loss of faith produced by the scientific and philosophical developments discussed in the previous chapter. To some extent it was on social and humanitarian grounds. First and foremost, the principle of religious intolerance and the practice of imprisoning or even burning dissidents were abhorrent to most Enlightenment thinkers. Many, too, condemned the Church for its vast wealth and the financial privileges it enjoyed, at the same time as it damaged the country's economy by removing so many men from the workforce, and even (at a time when population was perceived as a measure of prosperity) by preventing them from having children. There were even those like d'Holbach (1723–89), who, in works such as *La Contagion sacrée* (1768), anticipated the Marxist view of religion in seeing the Church as having always been in league with oppressive rulers to help keep the people in a state of submission. Some of these criticisms were no doubt unfair, and related more to excesses and abuses than to the essence of Christianity. But excesses and abuses aside, it may be argued that the Church stood for everything the Enlightenment was struggling to liberate itself from. The Church represented authority and restriction; it expounded a doctrine that could not be questioned, it told men what to believe and imposed on them a fixed view of the world and of their role in it. Whereas Enlightenment thinkers enthusiastically sought knowledge and gloried in the achievements and capacities of man, Christian morality was based on the original sin of tasting the fruit of the tree of knowledge, condemned the sin of pride and appeared to deplore most of man's natural inclinations.

It must not be forgotten, however, that rejection of Christianity did not necessarily mean rejection of God. While it is true that some of the more daring eighteenth-century thinkers saw atheist-materialism as the inevitable consequence of the new scientific thinking, the two great predecessors of the Enlightenment, Newton and Locke, had been able to reconcile their scientific and philosophical convictions with belief in God, and it was this kind of deism which seemed to most Enlightenment intellectuals to offer an acceptable compromise between the narrow authoritarianism of the Christian Church and the extreme of atheist materialism.

There were of course various deistic positions, ranging from the belief in a remote God who created the universe but is totally unconcerned with man, to a providential and personal God, such as Jean-Jacques Rousseau's, very closely modelled on the God of Christianity. Rousseau (1712–78) indeed claimed he was a Christian. He accepted the

sensationalist view of man, but was very conscious of the dangers of atheism and materialism, and saw himself as defending Christianity against the materialists; in the event, he managed to achieve the unique distinction of incurring the hostility of both Church and *philosophes*. The particular characteristic of his religion—expounded in the 'Profession de foi du vicaire savoyard', part of his work on education, *Emile,*—was the emphasis he placed on 'conscience', a divinely inspired interior voice in every individual which obviated the need for a church and its priests. In fact, Rousseau's religion became immensely popular: his trust in conscience, his scepticism about miracles, his admiration for Christ combined with hesitation about his divinity, such views made it particularly attractive to Christians who had become converts to the anthropocentric rationalism of the Enlightenment.

But the best representative of what one might call standard eighteenth-century deism is Voltaire (1694–1778), who was in many respects the dominant personality of the French Enlightenment, even if he was not a particularly original thinker. Voltaire, as we saw in the last chapter, kept abreast of developments in science, and was largely responsible for the popularizing in France of the thought of Newton and of Locke. But he took from them selectively, and in particular, if he welcomed Newton's defence of the existence of God, at the same time he played down his tendency towards a certain mysticism. For this was Voltaire's own position: despite a number of fluctuations in his thought, he maintained a firmly deistic stance, deeply opposed to atheism and materialism, while at the same time hostile to Christianity and largely impatient with metaphysics and any form of mysticism—so much so that critics have occasionally seen him (wrongly in my view) as a crypto-atheist.

Shortly after he returned from exile in England, in 1734, Voltaire began to set down in one of his few theoretical works, the *Traité de métaphysique,* his views on a range of philosophical topics, starting with the demonstration of the existence of God. The first of his two proofs was the watchmaker argument, which had been used by Newton: if a watch implies the existence of a watchmaker, the manifest order of the universe surely implies an intelligent creator; and if we accept that the hands of the watch have been constructed to show the time, it is reasonable to accept that the eyes, for example, have been designed by the intelligent creator for seeing. Voltaire's second proof was the first cause argument: I exist, therefore something exists, therefore something has always existed; for either what exists is necessary and eternal, in which case it is God, or its being has been communicated to it by something else, to which the same argument applies. Since the material world is manifestly neither eternal nor unchanging, it is not necessary by itself but contingent, and must owe its existence to a being which *is* necessary, i.e. God. Similarly, movement, thought and feeling must all have been communicated to matter by God.

Despite the apparent rigour of this argument, Voltaire was clearly much more attracted by his first proof, based on the marvellous order of the universe and the plausibility of final causes. He was not alone. It might be seen as paradoxical that the great strides that were being made in the natural sciences during the eighteenth century, while they contributed on the one hand to the undermining of theological explanations of the universe, at the same time generated an often mystical awe before the wonders of nature. Even more perhaps than the Newtonian order of the universe, it was the other end of the

scale—the study of maggots, worms, insects—that seemed to reveal the admirable wisdom and ingenuity of God. The distinguished physicist and entomologist Réaumur (1683–1757), for example, especially in his *Mémoires pour servir à l'histoire des insectes* (1734–42), saw the organization and behaviour of insects as nothing short of miraculous, leading inescapably to admiration for their creator. Even Diderot was at first greatly attracted by this kind of argument, suggesting in the *Pensées philosophiques* ([10.3]) that the mere wing of a butterfly, let alone the whole universe, surely offers compelling evidence of an intelligent creator—though, as we saw in the last chapter, he soon abandoned it in favour of the creation by chance theory.

Voltaire was particularly attached to the final cause argument as compelling evidence of the existence of a beneficent God (though it may be that it was a prior conviction that God was beneficent that made final causes seem so plausible). He recognized that the argument was not logically conclusive, it is true, but he saw it as providing a high indication of probability, constituting an appeal to common sense which it was only reasonable to accept—an approach to philosophy which he particularly favoured. To the objection that there is no proof, for instance, that stomachs are made for digesting, he retorted in the *Traité de métaphysique* that there is certainly no proof that they are not, and that common sense would surely suggest that they are.

In short, in the *Traité* and other works of the same period, Voltaire pictured a universe created by a God who was, if not concerned solely for the welfare of the human race, at least benevolently disposed towards it along with the rest of his creation. As a corollary, too, this deist God had endowed all men with both an awareness of moral good and a disposition to act in accordance with it. Concern for morality had in fact been a central feature of Voltaire's deism from the first, and belief in a universal innate moral sense, consisting of an injunction to obey an absolute 'natural law', was an article of faith to which he clung determinedly. In the face of a considerable body of apparent evidence to the contrary, he wriggled uncomfortably and unconvincingly: anthropological evidence of cannibalism, for instance, was explained away, and if in some tribes people ate their parents, it was no doubt to save them from being eaten by their enemies, or just a way (admittedly misguided) of honouring them. As for all the criminals in history, they were all secretly unhappy.

But then, however, Voltaire's faith in a benevolent God concerned with man and in the efficacity of a universal moral sense began to crumble, a development which was revealed particularly in a group of so-called 'philosophic tales' written from 1747 onwards. In *Micromégas* ([10.16]), for example, a gigantic traveller from the star Sirius is used as a vehicle for mocking the pretensions of the tiny inhabitants of this tiny planet, who wildly exaggerate their own importance in the universe. More frequently, however, this detachment was replaced by an expression of what sounds like Voltaire's disappointment at the fact that God was less concerned with man, and man less inclined to be good, than he had previously believed.

The Lisbon earthquake disaster in 1755, in which tens of thousands of people were killed, finally dealt a crucial blow to Voltaire's belief in the perfect order of the universe, or at least confirmed his suspicions that the order that existed was neither relative nor relevant to man; and the outbreak of the Seven Years War the following year undermined still further his faith in a God-given universal moral sense. His most famous work,

Candide (1759) ([10.16]), is the embodiment of this revised philosophical position. Conceived ostensibly as an attack on Leibnizian Optimism (though directed in practice rather at the popularized version of it in Pope's *Essay on Man* (1733–4)), it proceeds by ridicule rather than refutation, continually mocking the doctrine of 'the best of all possible worlds' as it is taught by Candide's tutor Pangloss, who is a disciple of Leibniz, and not only stupid, but too obstinate to admit that he is wrong about the best of all possible worlds, even when the grotesque disasters that befall him make him realize he is. Beneath the savage humour, however, Voltaire is making the serious point, consistent with the ideological approach of the Enlightenment, that experience should take precedence over metaphysics, and that experience of this world soon demonstrates that it is not the best of all possible worlds. We witness earthquake, war, rape, murder, and all kinds of brutality, ample evidence of an uncaring God and of the apparent absence, in many men at least, of any moral sense.

Of course, the fact that everyone is not happy in the real world and that Candide and his friends suffer dreadful misfortunes in no way impinges on Leibniz's principle of Optimism, or even, as Voltaire knew full well, on the notion that the universe as a whole is harmonious and ordered. But again adopting a standpoint characteristic of the Enlightenment, he is protesting that he is concerned with man rather than the universe; the benevolent God who is concerned with the universe rather than man is as irrelevant to man as man is to him. The point is made succinctly in the final chapter of *Candide* when the travellers go to consult a Turkish sage: in answer to their question about the existence of evil in the world, he asks them whether, when the King sends a ship on a voyage, he is worried about the mice in the hold.

But this affirmation of man's insignificance in the eyes of God was by no means Voltaire's last word on the subject. It was difficult to use such a remote God as the foundation for a moral code which would fill the gap created by the rejection of Christianity, and Voltaire was becoming increasingly worried by the spread of atheism and materialism among the *philosophes,* and the dangerous moral consequences that would ensue if the loss of religion became more widespread. It seems likely that it was principally this preoccupation with morality that prompted him after *Candide* to return pragmatically to the God intimately concerned with man he had depicted in his earlier works, and even to the doctrine of final causes, which he had particularly ridiculed in *Candide,* and which amounted to saying that the world was arranged by God specifically for the convenience of man. In works such as *Des Singularités de la Nature* (1768) ([10.16]), totally resisting the current of evolutionary ideas that were beginning to be voiced and staying closer to Linnaeus than to Buffon, he expressed his conviction that there had been a once-and-for-all creation in which all things had been given their allotted place and purpose: just as the organs of the body had obvious functions, so too the mountains and the rivers (providing drinking water) were also evidence of divine providence. In return for this benevolence, God required obedience to the uncomplicated moral law of 'Worship me and be good', and rewarded and punished accordingly. Voltaire seemed to be convinced that without belief in this kind of punitive God, the moral order of society was gravely threatened. In short, 'If God did not exist, he would have to be invented' ([10.16], 10:403). Voltaire's fear of the disastrous moral consequences of atheism was summed up with a wit that should not be mistaken for

levity: ‘I want my lawyer, my tailor, my servants, even my wife to believe in God, and I suspect I shall thus be less robbed and less cuckolded’ (*L’ABC,* [10.16], 27:399–400).

Voltaire’s assumption that atheists were more likely to be wicked than believers may not have had any empirical basis, but it was a deeply-held and widely-shared prejudice—despite Bayle’s demonstration as long ago as 1682 that it was without foundation. And the theoretical moral implications of atheist-materialism did indeed seem to be disturbing. More than anyone else, it was Diderot who, explicitly and repeatedly, spelled out these implications. As we saw in the last chapter, despite his reservations about Helvetius’s view of man, he did not demur from his conclusion that moral freedom is an illusion. And if this is the case, man cannot be held responsible for his actions: ‘if there is no freedom, there are no actions which deserve praise or blame. There is neither vice nor virtue, nothing which calls for reward or punishment’ (letter to Landois, [10.3], 19:436). The wicked man cannot be blamed for his wickedness, which is a determined characteristic like any other, the result of physical organization and environmental conditioning. The point is made with forceful clarity in an unsigned addition to the *Encyclopédie* article ‘Vice’, most probably by Diderot: ‘Can a man help being pusillanimous, voluptuous, or just irascible, any more than squint-eyed, hunch-backed or lame?’.

It was the awareness of this apparent moral abyss which had initially deterred Diderot from wholeheartedly accepting the atheist materialism to which he was intellectually attracted, and which later led him to refrain from publishing his more daring works (such as the *Rêve de d’Alembert*). He illustrated the problem graphically in an incident in the allegorical *Promenade du sceptique* ([10.3]), written in 1747; Athéos, an atheist philosopher, and a man of virtue, convinces the symbolically blindfolded Christian of the error of his beliefs, and as a result the Christian throws off all moral restraint along with his blindfold, burns down Athéos’s house and steals his wife. The anxiety manifested in this little story is not dissimilar from Voltaire’s, and was probably shared by most of the *philosophes*. But the very expression of the anxiety paradoxically revealed their own attitude to virtue: it went without saying that they shared the same moral standpoint, that philosophers were virtuous, and that their atheism and materialism had not made them socially destructive. The problem was, then, other people: what would happen if those who were not philosophers should become converted to atheism?

In fact, the Enlightenment view of man was an ambiguous one. Although Rousseau might be described as a kind of Enlightenment maverick, his philosophy was in this respect a distilled and emphatic version of that of most of his contemporaries: when he said that man was naturally good, he was referring to the essence of man, or to a primitive, pre-social man, long since vanished; as for actual existing men, that was a very different matter, as he felt he had all too good reason to know, and much of his work is devoted to analysing the unhappiness and corruption of the members of a modern society. Whatever other thinkers thought about the essence of man, they mostly seemed to agree that men in practice were inclined to be bad, in the sense of anti-social, or at least that a sufficient proportion of them were to constitute a moral and social problem. On the other hand, if Enlightenment thinkers attached so much importance to the liberation of man from the oppression of Christianity and the doctrine of Original Sin, it was because one of their fundamental principles was the right of man to happiness—Diderot indeed went so far as to say: ‘There is only one duty, and that is to be happy’ ([10.4], 320). Which was

implicitly to approve of the self-interested behaviour identified by the materialist analysis of man. What had to be demonstrated was that self-interest was not necessarily anti-social.

One approach was simply to claim that man was so constituted that he was *naturally* virtuous, in the sense of benevolently disposed towards his fellow men (or 'bienfaisant', as Diderot preferred to call it). In other words that self-interest led men, more or less automatically, to behave virtuously. This was in fact the thesis put forward in *L'Homme machine* (1748) by Julien Offroy de la Mettrie (1709–51): if he saw man as a machine, it was a very sophisticated machine, with a built-in moral sense and capacity for remorse, so that wrong-doers suffer as automatically as they do wrong. Remorse and conscience are, like thought, attributes of matter, and we distinguish good from evil as mechanically as we distinguish blue from yellow. La Mettrie's well-intentioned attempt to resolve the problem was decidedly simplistic—one might have answered him that there seemed to be a great many faulty machines on the market—but rejection of the doctrine of Original Sin and its repressive consequences led most materialists to express views which were not fundamentally very different. Diderot continued throughout his life to reiterate the view he had expressed so baldly at the very beginning of his career, that 'without virtue there is no happiness', even though at the same time he accepted, realistically if regretfully, that he was speaking only for a portion of the human race. Arguing that the terms 'virtuous' and 'wicked', which imply moral responsibility, should be discarded, he classified people into two categories, the 'fortunate by birth' ('heureusement nés') and the 'unfortu-nate by birth' ('malheureusement nés'). Whether one was constitutionally disposed to behave helpfully or harmfully to society was all a matter of chance.

But this was clearly an unsatisfactory position, and Diderot continued to cling to the conviction that the 'heureusement nés' were the norm, even though they might not be in the majority, and that the 'malheureusement nés' were in some way deficient—which was not very different from Rousseau's belief that man was 'naturally good'. In practice, along with most of the other *philosophes,* although he demonstrated that people's moral standards were acquired from experience rather than absolute, Diderot clearly believed in the existence of certain fundamental absolute moral criteria—very much like the universal morality which deists like Voltaire saw as coming from God. In reply to Helvetius, one of the few who steadfastly maintained that absolute justice and injustice do not exist, he asserted that the author of *De l'esprit* would have realized his mistake if he had paid more attention to the nature of man, and reflected that 'anywhere in the world, he who gives something to drink to the man who is thirsty, and something to eat to the man who is hungry, that man is good' ([10.3], 2:270). Such absolute moral criteria were determined by 'the laws of nature'; for, as Diderot wrote in his *Entretien d'un père,* 'nature has made good laws since the beginning of time' ([10.3], 5:297). He and the other *philosophes* were very much given to attributing a will and intentions to nature in this way. To some extent, no doubt, it was no more than a linguistic convention, a convenient way of talking about the evolution of the material world; but it frequently verged on a quasi-mystical divinization of nature, which atheists like Diderot sometimes seemed to seize on as a replacement for the God they had dispensed with.

However, the belief in some kind of absolute and universal code of morality still left unexplained the existence of so many who appeared to remain insensitive to it, the

'malheureusement nés'. Diderot tended to see the attractiveness of virtue as a kind of aesthetic truth, accessible only to those who had appropriate taste. In a letter to Voltaire, he explained that atheists 'could not, if they had good taste, put up with a bad book, nor listen patiently to a bad concert, nor tolerate on their wall a bad picture, nor commit a bad action' ([10.5], 1:78). So that those who were capable of bad actions were lacking in 'normal' aesthetic sensitivity. Just such a one was Rameau, the materialist protagonist in Diderot's brilliant dialogue *Le Neveu de Rameau,* and his interlocutor, the virtuous philosopher T, asks him how it is that despite his great sensitivity to 'the beauties of the art of music', he should be 'so blind to the beauties of morality, so insensitive to the charms of virtue' ([10.3], 5:468). (Rameau replies, of course, that it is all the result of environmental conditioning, heredity and physical constitution.)

D'Holbach too saw it as a question of moral blindness. For him, the virtuous man has the inestimable reward of self-esteem, as he surveys his actions with the same pleasure that others would feel 'if they were not blinded' ([10.8], 1:321). But such explanations seem if anything to make the problem even more irreducible, for how can the morally blind be made to see? Fortunately, Diderot and d'Holbach both believed that virtuous behaviour brought with it advantages that could be perceived even by those who where not naturally inclined to love it—and it must be emphasized that it was behaviour rather than motivation that they were concerned with. In his letter to Landois, the very one in which he described so vividly the moral implications of materialism, Diderot claimed that wicked actions never go unpunished, because they lead inevitably to 'the contempt of one's fellow-men', and that is 'the greatest of all evils' ([10.3], 19:435). The importance of the respect of other people was a point he came back to repeatedly, and he clearly believed that their disapproval was a deterrent to which all men were susceptible. D'Holbach's view was much the same. Because his actions are seen as despicable by his fellow-men, or would be if they were known to them, the wicked man is always in his heart ashamed and unhappy, however great the material advantages of his wickedness ([10.8], 1:235–6). Conversely, the man who habitually behaves virtuously is motivated by the desire for the esteem of others, and for the consequent pleasure of self-esteem; but the force of habit becomes so strong that self-esteem alone will suffice to deter him from wicked actions, even if he could be sure of their remaining hidden, just as the person who has acquired the habit of cleanliness hates getting dirty (the choice of analogy speaks for itself ([10.8], 1:313–14).

So that the wicked man is indeed blind, not just to the beauty of virtue, but to his own true interest; which is why we should pity him rather than blame him: 'You pity a blind man; and what is a wicked man if not someone who has short sight and cannot see beyond the present moment?' (*Encyclopédie* article 'Vice'). But if he remains resolutely blind despite the experience which should have opened his eyes, what is to be done? The answer is obviously that he must be modified. Now this pragmatic solution had a sound philosophical basis. If, as the materialists argued, man's behaviour is no more than the product of his physical organization and environmental conditioning, then it is clearly possible to modify it by modifying the conditioning. In the discussion of the subject in his humorous novel *Jacques le fataliste,* Diderot explains that Jacques 'became angry with the unjust man; and when you objected to him that he was behaving like the dog who bites the stone that has hit him, he would reply: '"Not so, the stone bitten by the dog

will not change its ways; the unjust man will be modified by the stick"' ([10.3], 6:181).

No doubt the stick was the most obvious way of modifying men's behaviour. Although the *philosophes* all criticized the repressive nature of the society they lived in, they nevertheless recognized that even a just society would need punishments for the anti-social citizen. But it was consistent with their humanitarian attitude that they should put far more emphasis on methods other than the stick of modifying men's behaviour. It was the human environment that was crucial. Rameau's nephew, in Diderot's work, suggests that one of the reasons why he is good at music but bad at morality may be that he has 'always lived among good musicians and wicked people' ([10.3], 5:468). The materialists all emphasized that habit was supremely important in human development. 'Nature', said Helvétius (1715–71), 'is nothing other than our first habit', and he reminded his readers that if they are horrified by the Romans' enjoyment of gladiatorial combats, it is only as a result of their different upbringing, and that if they had been born in Rome, 'habit' would no doubt have made them find the same spectacle agreeable ([10.7], 191). It was then upbringing and education that, by inculcating habits, provided the principal means of modifying human behaviour.

But it did not need Helvétius' materialism to convince people of the importance of education and of the need to reform current practice. From the middle of the century onwards, in fact, discussion of the subject was very much in vogue, and it was a few years after *De l'esprit,* in 1762, that there appeared one of the most important works in the history of educational thought, Rousseau's *Emile ou de l'éducation*. In many ways, *Emile* reflected the prevailing currents of Enlightenment thought. Rousseau's enthusiasm for the goodness of nature was in general shared by most of the *philosophes,* despite their many ambiguities on the subject, and although the work was theoretically based on the natural goodness of man, he used this proposition as a way of demonstrating that education should consist above all in protecting the child from the corrupting influences of society—corresponding in practice to the programme suggested by Helvetius and d'Holbach. Rousseau accepted fully a sensationalism very close to Condillac's (though he explicitly refuted the extreme position adopted by Helvetius), and the education of the young child reflected this, with much emphasis being laid on the development of each of the five senses, and especially on the relationship between sight and touch, in a manner very reminiscent of the *Traité des sensations* (see above, Chapter 9, pp. 239–40). In one important respect, however, *Emile* diverged from the thought of the other *philosophes:* much as he admired the virtuous citizens of ancient Greece and Rome, Rousseau declared at the outset that such an ideal was impossible to recreate in a corrupt modern society, and the aim of the work was the formation of an independent, self-sufficient individual rather than a citizen who functioned primarily as a constituent part of a social whole.

But the reform of education, precisely because it accepted the structures of society as it then existed, was necessarily limited. The idea that man in contemporary society was *necessarily* corrupt was frequently expressed by the *philosophes:* Rousseau had demonstrated it in his *Discourse on inequality* in 1755, and when thinkers such as Diderot and d'Holbach attacked social and political injustice, they tended to adopt the same position, though in their case it was probably more of a polemical device than a deeply held conviction. But even if they held less extreme views than Rousseau on the subject, they shared his view about the urgent need for political reform, without which

educational reform might seem to be little more than a palliative; Helvetius for example asserted that the two were so closely linked that it might well be impossible to make major changes in education without making corresponding changes 'in the very structure of states' ([10.7], 492).

Political thought is fundamentally different from what one is tempted to call 'pure philosophy' in that it is rarely if ever concerned principally with the objective quest for truth (even when it purports to be), and is always dominated by a response to actual contemporary conditions. In the case of the *philosophes,* this response was, it is true, determined by certain humanitarian convictions, the right to happiness, usually seen as inseparable from freedom (variously defined, as we shall see), equality before the law, and so on, all arguably following logically from their moral anthropocentrism. At the same time, however, their political thought was first and foremost shaped by the abuses of the *ancien régime,* the manifest injustice of the extremes of wealth and poverty, the existence of privilege, inequality before the law, religious intolerance…, and in some cases, the consciousness of the urgent need for practical reform took precedence over theoretical considerations about the nature of government and the structure of society.

It was above all Voltaire who came into this last category. He made virtually no attempt to systematize his political thought, which consisted largely of a series of pragmatic reactions to specific social problems. He shared the other *philosophes*' humanitarian convictions about human rights, and hated injustice, oppression and intolerance; but his principles were always tempered by a sense of realism, even expediency. Early in his career, largely due to his exile in England following a quarrel with a powerful nobleman, he conceived great enthusiasm for the English system of constitutional monarchy (somewhat idealized). But when it came to the actual situation in France, he firmly supported an absolute monarchy, even though he recognized the risk of absolutism degenerating into despotism. For the only intermediate powers between King and people were the clergy, the aristocracy, and the Parlements (regional high courts with considerable powers, including the right to block legislation), all of which Voltaire saw as defending sectional interests and the abuse of privilege. His ideal was a strong enlightened monarch, but given the actual problems of government, the strength was perhaps more important than the enlightenment. In the conflict between the throne and the Parlements which dominated the latter years of the *ancien régime,* Voltaire was emphatically on the side of the throne, which he continued to see as offering the best chance both of initiating reform and of averting revolution.

It is true that Voltaire's very real sympathy for the sufferings of an oppressed people was always accompanied by the fear of popular disorder, and ultimately revolution, which underlay his desire for strong government as much as did his desire for reform—paralleling his belief in the need for a policeman god to discourage his tailor from robbing him. But behind his anxiety about disorder—shared by practically all the *philosophes*—his works reveal a fundamental desire to preserve existing social institutions, suitably reformed. He advocated religious toleration, freedom of the press, and the reform of criminal law, but the main burden of his political thought was the defence of the freedom and rights of the middle classes, inseparable from the protection of their property. Certainly he believed in kindness to the poor, but if he advocated equality before the law, he was not keen on too much social equality. Society could not

exist, he argued in his *Dictionnaire philosophique* (article 'Egalité'), without 'a vast number of useful men who have no possessions at all' ([10.16], 18:476), for who would till our fields and make our shoes if there were no poor? Fortunately most of the poor are too busy working to notice their plight, though when they do, this just leads to wars which they inevitably lose, ending up in a worse state than before. Nevertheless, one must bear in mind the essentially pragmatic nature of Voltaire's thought and the practical limitations of contemporary society, and it could well be argued that his vigorous protests against oppression, his realism and his concentration on practical issues did more for suffering humanity, even in the long term, than the Utopian schemes of some of his contemporaries.

The most important work on political science in the eighteenth century was surely *De L'esprit des lois,* published in 1748, by Charles de Secondat, Baron de Montesquieu (1689–1755). Although Montesquieu's thought was no doubt triggered by the consciousness of contemporary problems, which he saw as largely the legacy of the arbitrary government of Louis XIV, he went further than anyone else in the century towards establishing a theoretical basis for the subject. Although he dismissed as absurd the notion that the world could have been produced by 'a blind fatality', seeing it as self-evident that intelligent beings must have been created by an intelligent God, his approach was in other respects very similar to that of the scientific materialists who sought to discover the underlying laws governing the behaviour of matter—indeed he also rejects as absurd the possibility of God operating on the world other than through these invariable laws. While recognizing that 'the intelligent world' was much less well governed than the physical world, Montesquieu believed nevertheless that it too had its underlying laws (Diderot's 'laws of nature'), preceding all laws made by men: with rather dubious logic, he argued that just as the radii of a circle were all equal before anyone had ever drawn a circle, so the notions of just and unjust (and by implication the obligation to behave justly) existed independently of any man-made laws.

Rejecting Hobbes's view of a wolf-man in a state of war, Montesquieu argued that primitive man would have been characterized by the consciousness of his weakness rather than by feelings of aggression, and he imagined the origin of society as lying in a natural sociability. But once societies had been formed, positive laws were needed to embody and supplement the fundamental laws, and these positive laws had to vary with the enormous variety of local circumstances. They must be appropriate to differences in climate and soil, in the situation and size of societies, in the way of life of peoples, their religion, their temperament, traditions, and so forth. It was the relationships between laws and all these different factors that Montesquieu proposed to study in the *Esprit des Lois*.

There were, he observed, three forms of government, the republican, subdivided into democratic and aristocratic, the monarchic and the despotic, each with their distinct characteristics and guiding principles. He gave despotism, which he saw as based on fear, very short shrift, whereas, sharing as he did in the general Enlightenment enthusiasm for ancient Greece and Rome, he found much to admire in the republic, particularly in its democratic form. The guiding principle of the republic was virtue, which Montesquieu defined as love of the law, involving a preference for the public interest over private interest.

But his admiration for the democratic republic was very theoretical, and he saw it as

extraordinarily difficult to realize, even in the very small states to which alone it was suited. In practice, his clear preference was for monarchy, which has no need for virtue in the above sense, being based instead solely on 'honour', in other words on the pursuit of personal ambition and the desire for distinction, both natural traits. Love of the 'patrie' and self-sacrifice are simply replaced by laws, so that 'each person works for the common good, believing he works for his individual interests' (III, 7, [10.11], 27). When he visited England in 1729–30, Montesquieu had discovered what he saw as the ideal constitutional monarchy, based on the separation of legislative, executive and judicial powers, and this separation of powers was to become the guiding principle of his own proposed scheme of government. His criterion was political liberty (in contrast to the equality which characterized democracies): but since 'any man who has power is led to abuse it' (XI, 4, [10.11], 155), the only way political liberty can be safeguarded is by a system of checks and balances, based on the separation of powers.

Montesquieu's political thought has been described as a mixture of Cartesianism and empiricism. Certainly it contained a number of a priori elements, and proposed a mechanistic model of society, in which he seemed to have made the mistake of applying to human behaviour the invariability of cause-effect relationships characteristic of the material world, though in this he could be said to be closer to Condillac and Helvetius than to Descartes. Montesquieu's great importance and originality, however did not lie in the model of government he proposed, but rather in his empirical, analytical approach to the subject. No doubt he was given to unwise generalizations and over-simplifications about the effect of climate and soil, etc., but in recognizing the relativity of truths about human nature, and in trying to discover the various laws determining the formation, structure and functioning of different kinds of society by observing and analysing actual societies (despite the inadequacies of his historical and anthropological knowledge), he was putting politics on a modern scientific footing and virtually creating sociology.

It is true that, politically speaking, Montesquieu defended the privileges of the aristocracy and his system of checks and balances seemed to produce an equilibrium which was essentially static, militating against any kind of change. But as far as France was concerned, this model represented for him a vast improvement over the degenerate government of Louis XV, and he certainly shared the humanitarian hostility of the *philosophes* to injustice and oppression. He fiercely attacked despotism and even more slavery, especially of the blacks: how can we believe that 'god, who is a very wise being, should have put a soul, above all a good soul, in a body that was entirely black'?, he asked ironically (XV, 5, [10.11], 250). And he did believe in the possibility of progress and reform, in the ability of a good government to modify its citizens. When he described the effects on men of different climates, for example, his attitude was far from passive: if the effects were bad (when, for instance, an extreme climate led men to be lazy or women immodest!), it was up to the legislator to correct them. 'Bad legislators', he wrote, 'are those who have favoured the vices of the climate and good ones are those who have opposed them' (XIV, 5, [10.11], 236).

The influence of *De l'Esprit des Lois* on Montesquieu's contemporaries seems to have been immediate, widespread and very selective. While the *philosophes* welcomed his scientific approach to politics, they tended to reject precisely the innovative political sociology, based on relativism and the introduction of variables. Human nature for

Condillac, Helvetius and even for the more subtle Diderot, had fixed characteristics (always and everywhere the same needs and desires) and was thus modifiable in an entirely predictable way: a given cause would always produce a given effect. So politics became a simple extrapolation from scientific psychology: all the legislator had to do was construct society in accordance with human nature. Now if Virtue', in the form of a preference for the general good over personal good, is indeed natural, as Diderot, for example, sometimes claimed, this will present no problem. The real difficulty for the organization of society is the existence of the morally blind or defective citizens, and the solution, as with personal morality, is provided by the modifiability of man inherent in sensationalist psychology.

Civic virtue can of course be stimulated by the same means used to encourage virtuous behaviour at the personal level, and especially by the formation of good habits by education. The point was made repeatedly by Helvétius, as well as by d'Holbach, for whom education was the principal way of 'giving to the soul habits which are advantageous for the individual and for society' ([10.8], 1:287). And Morelly, in his utopian *Code de la Nature,* saw moral transformation by education as a prerequisite for the creation of the ideal society.

But even without moral transformation, there are qualities in men condemned by conventional (Christian) morality, which, properly used, can be socially constructive. Instead of trying to suppress human passions such as ambition and the desire for wealth, said d'Holbach, society (as in Montesquieu's ideal monarchy) should make the most of them and turn them to its advantage ([10.8], 1:147); and in the *Supplément au Voyage de Bougainville,* Diderot showed that the sexual drive, far from being anti-social, made an invaluable contribution to society if, as was then generally believed, prosperity was dependent on population size. In any case, people will behave virtuously if they can see that it is in their own interests. So society, by using the carrot rather than the stick, should make it worth people's while to behave virtuously. The trick, as Diderot pointed out in one of his dialogues, is to construct society in such a way that 'the good of individuals is so closely linked to the general good, that it is almost impossible for a citizen to harm society without harming himself ([10.3], 2:517). D'Holbach too stressed that in the well-governed society, each citizen would be convinced that the 'well-being of the parts could result only from the well-being of the body as a whole' ([10.8], 1:319). And Helvétius also had made much the same point. A recurrent theme in *De l'esprit* had been that 'the virtues and vices of a people are always a necessary effect of its legislation' ([10.7], 325): Helvetius quoted many examples to demonstrate that the extraordinary incidences of civic virtue in the history of Ancient Rome and Sparta were the result of 'the skill with which the legislators of these nations had linked individual interest to the public interest' ([10.7], 324). Indeed, it was precisely the absence of such a link in the modern state (in other words France) which caused the alienation of modern man vividly described by d'Holbach, a man who had no feeling of involvement in the society in which he lived, and who, in the words of both Diderot and Rousseau, was 'neither man nor citizen'.

As for the actual political structure of society, the confidently rationalist approach of the *philosophes,* tending to make them see truth as absolute and indivisible, led them to reject Montesquieu's checks and balances and to see an absolute indivisible monarchy as

the only logical ideal; intermediate bodies, they argued, would represent sectional interests, which might well differ considerably from the interest of the community as a whole. The intellectual objectivity of this theoretical analysis might, however, be seen as highly suspect, given that it coincided conveniently with the view that the *philosophes* shared with Voltaire that the principal source of injustice and oppression in France was the abuse of power and privilege on the part of the Church, the aristocracy and the Parlements. Diderot, in the *Encyclopédie,* and d'Holbach both maintained that sovereignty belonged to the people as a whole, and was entrusted by them to a ruler by a kind of contract, explicit or tacit; sovereignty acquired without the consent of the people was merely a usurpation, which would last only as long as the superiority of strength which initiated it. Furthermore, the two *philosophes* argued, the consent could never be unconditional: the object of government could only be the well-being and happiness of the governed, and the use by a sovereign of the powers entrusted to him to make a people unhappy was, in Diderot's words, 'a manifest usurpation' (*Encyclopédie,* article 'Souverains'), or, as d'Holbach put it, 'nothing but banditry' ([10.8], 1:336).

But history convinced the *philosophes* that this, alas, was all too likely to happen, and that, to quote d'Holbach again, this time echoing Montesquieu, 'man is always tempted to abuse power' ([10.8], 1:145). Having rejected Montesquieu's solution of the separation of powers, they opted instead for assemblies representing the people to advise the monarch, since, as the *Encyclopédie* article 'Représentants' (by Diderot or possibly d'Holbach—scholarly opinion is divided) explained, this is the only way the good sovereign can be made aware of the needs of all his subjects. And to avoid the representatives themselves losing sight of their responsibilities, they would have to be regularly elected. But only by those subjects who own property: 'it is property which makes the citizen: every man who owns something in the State is interested in the good of the State'. Diderot, d'Holbach, Helvetius were all agreed that those who did not own property in a state could not possibly have a serious interest in its prosperity, and should not therefore have any say in its government, just as, conversely, one of the first responsibilities of a ruler or ruling body must be the safeguarding of private property. The general interest of a society lay for d'Holbach in the three advantages which just laws should guarantee for the majority of its citizens, liberty, property and security—and even the latter was defined as the right to protection by the laws of a law-abiding citizen's person and property.

Private property was also at the very centre of the system proposed by the physiocrats, a school of thinkers who had come together as a group by about 1760, and who saw economics as the key to politics. Like the *philosophes,* they believed that the organization of society was governed by the same kind of fixed 'natural' laws as the material world, but for them these laws related essentially to trade. The founder of the school, François Quesnay (1694–1774), himself a doctor, saw the circulation of wealth in society performing the same function as the circulation of blood in the body. Their system involved the simplest form of government, an absolute monarchy, and a minimum of laws: starting from the premise that agriculture, and thus ownership of land, constituted the original source of all wealth, their implicit optimism concerning human nature led them to believe that the complete freedom of trade would result in the self-regulating balance of supply and demand as men realized their interdependence, creating prosperity and happiness for all.

Rather than Quesnay, however, it was Anne-Robert-Jacques Turgot (1727–81), a distinguished civil-servant and subsequently statesman, who gave these ideas their most lucid expression, and whose version of them was the most perceptive. In a remarkable anticipation of both Adam Smith and Marx, as well as twentieth-century theories of entrepreneurial capitalism, his *Reflections on the Formation and the Distribution of Wealth* (written 1766–7) developed an economic system firmly based on an historical sociological analysis which showed that societies operated according to predictable laws of cause and effect. The economic cycle begins with the surplus produced by the 'Husband-man' 'over and above his personal needs' ([10.15], 122), and the continued cultivation of land, the industry and the commerce necessary for the health of a society all depend on the circulation of money, which occurs in various ways. And it was an essential feature of Turgot's system that the different uses of capital will tend 'naturally' to achieve the ideal equilibrium necessary for the maximum benefit to society, though this will only occur where trade is untrammeled by restrictive laws, especially in the form of taxes.

Turgot's belief that man is so constituted that society tends naturally to perfect itself was not confined to the sphere of economics. In his *Discourse On Universal History,* he showed how, driven to action and thus to progress by the passions, in other words the urge to satisfy needs, and passing through violent fluctuations in its fortunes, 'the human race as a whole has advanced ceasely towards its perfection' ([10.15], 72). It is true that he had rather more confidence than most of his contemporaries in a natural evolution of society towards something like perfection, though the *philosophes* in general were optimistic about the future of mankind. But the most systematic exponent of the perfectibility of human society was Antoine-Nicolas de Condorcet (1743–94), whose *Esquisse d'un tableau historique des progrès de l'esprit humain,* was written, ironically, while he was in hiding after his proscription by the Revolutionary government consequent on his own involvement in politics. The *Esquisse* divided the history of man into successive ages, revealing a story of continual progress achieved over the centuries despite an unending battle with the forces of reaction, represented mainly by the Church. But now, as scientific knowledge of man and the universe continued to increase, and as men became progressively more enlightened, Condorcet believed, with what now looks like touching simplicity, that the end of the battle was at last in sight. It would be achieved by a mixture of natural development and positive legislation. He accepted to some extent Turgot's vision of a self-regulating economic system based on free trade, but he also believed in the necessity of governmental intervention to protect the weak and the poor. In fact, the removal of social and even natural inequalities was central to his idea of progress: he attacked slavery, argued for the equality of women (very much an exception during the Revolutionary period), and above all advocated universal education, on which his ideas (free elementary education for both sexes, teaching children to think for themselves, the independence of teachers, etc.) were admirably enlightened even by late twentieth-century standards.

Whereas Condorcet thought optimistically that society was already well on the road to perfection, however, there were in the second half of the eighteenth century a number of egalitarian political thinkers whose utopias involved a far greater transformation of society (though not, usually, a violent one) than was to be brought about merely by the

French Revolution. The earliest and most interesting of these was Morelly (about whom virtually nothing is known), who envisaged in his *Code de la Nature* (1755) a gradual return, facilitated principally by a reform of moral education, to the ideal natural state in which men had been motivated solely by the benevolence produced in them by an awareness of mutual need. In modern society, 'natural probity' has become debased by the growth of avarice, man's one fundamental vice from which all others derived; and it was avarice that led to the existence of private property, which was, as Morelly emphasized throughout, the root of all social evil. In the ideal society, all land and all products of the land would remain common, all other goods would be distributed by laws according to need.

These principles were embodied in the 'Modèle de législation conforme aux intentions de la Nature' which concluded the *Code de la Nature*. Nothing would be sold or exchanged, but all produce would be taken to the Market Place, where people would simply take whatever they needed. All citizens would engage in agriculture from twenty to twenty-five; and all would marry as soon as they reached puberty, with celibacy permitted only after forty. There would be a minimum of penal laws, but life imprisonment would be the punishment for serious crimes such as murder, or any attempt to introduce 'la détestable propriété' ([10.12], 323).

The eccentric Benedictine, Dom Léger-Marie Deschamps (1716–74), whose ideas impressed both Diderot and Rousseau, also focussed on property as the source of all moral evils. In *Le Vrai Système,* written about 1770, he contrasted society as it is, which he described as the state of laws, based on property, with the utopian state of 'moeurs', the state of morality. In the absence of private property, all land, all women would belong to all (all men, too, though he makes less of this); even mothers and children would be common, with those women who were able to suckling any babies, or indeed any old men, 'who would grow strong and be rejuvenated from their milk' ([10.2], 171). In the state of 'moeurs', all would be equal and completely united, with the good of society as their only aim. Every factor in society causing differences between individuals would be suppressed: children would not be taught to read or write, all books would be burned, all works of art destroyed. Without desires or passions, through days that were always the same, people would live in total tranquillity, with no personal attachments, indifferent to death, never laughing or crying. The individual would become totally subsumed in the general, existing in a mystical state of harmonious oneness.

Now it was a characteristic of virtually all the political thinkers we have been discussing that they glossed over the conflict between the individual's natural desire for liberty and the political need for the individual to be subordinated to the state, by assuming that it was in some way natural for a naturally sociable man to prefer the general interest to his own, or at least that an enlightened reason would lead him to realize that his own interest was dependent on that of the state. Rousseau, whose political thought is discussed in detail elsewhere in this volume, was the exception in seeing natural man and social man or the citizen as diametrically opposed. In his *Second Discourse* (1755) Rousseau had argued that the origin of inequality among men, and thus of their corruption and unhappiness, had been the introduction of private property, which led to rivalry and the replacement of natural self-love *(amour de soi)* by self-preference *(amour-propre)*. But he always recognized that the state of primitive innocence was

irrecoverable, and postulated two alternative solutions to the woes of alienated modern man: one, the aim of *Emile,* was to attempt to create by education a modern version of natural man, adapted to live in society as it is; the other was a total reorganization of society, to create a democratic republic inspired principally by the city states of the ancient world, which he described in his *Social Contract* (1762). Self-oriented natural man would have no place in such a society; the ideal citizen, said Rousseau, must lose all sense of self and be concerned only with the common weal. There was nothing natural about this abnegation, which must be inculcated by the laws and civic education. Political freedom consisted for Rousseau in willing the general good, so that some people will have to be forced to be free by the laws which embody the general will. Nothing contrary to the general will must be permitted, so there can be no freedom of thought in the usual sense of the term. There will be a state religion and no other, decreeing the sanctity of the laws and outlawing intolerance (!): anyone unwilling to accept its doctrine will be banished, and anyone who, having accepted it, behaves as if he had not, will be executed.

It seems highly probable that this highly theoretical construct represented nothing more for Rousseau than a systematic logical application of a number of speculative principles, and the dichotomy in his thought between a theoretical ideal and the possibilities of the real world was reflected in one way or another in the political ideas of most of the *philosophes*. In considering the ideal society, they could not escape from the realization that the existence of private property, the defence of which was for them a cardinal principle of political freedom, was incompatible with real (and not just political) equality. From time to time, Diderot indulged in utopian egalitarian flights of fancy, clearly influenced by Morelly and Deschamps, as for instance in the idealized Tahitian society of the *Supplément au Voyage de Bougainville*. In reality, though, he recognized that this kind of thinking was pie in the sky, and just like Voltaire, d'Holbach, Helvetius and indeed Rousseau, he continued to see the protection of private property as a *sine qua non* of the just and healthy society. Not only must property be a prerequisite for citizenship, but it was indispensable for the material prosperity, based on commerce and industry, which the Enlightenment thinkers were so enthusiastic about. The ideal of most of the *philosophes* was a materially prosperous property-owning democracy with a minimum of inequalities, and though they talked much about the sovereignty of the 'peuple', it was clear that in the majority of cases what they meant by 'peuple' was the bourgeoisie rather than anything like the Marxist proletariat.

Be that as it may, the *philosophes* were none the less vigorously opposed to injustice and oppression, and more specifically to the political regime they lived in. The Enlightenment was fundamentally a movement of intellectual challenge to authority on every level, and nothing any longer was sacred, especially not religion. But the far-reaching practical implications of the challenge to political authority made it a rather different matter from, say, rejecting the Church's doctrine on free-will or virtue, and at least to begin with, the *philosophes* were opposed to violent revolution. They wanted change, but peaceful, structured change. However, as hope for constitutional change in France seemed to recede and the enlightenment of Frederick the Great and Catherine of Russia looked more and more like a façade, the theme of the legitimacy of revolt against the abuse of power appeared ever more frequently in the works of Diderot and d'Holbach. The notion of the sovereignty of the people, and the associated one of a

contract between people and ruler led directly to the conclusion that when the contract was broken by the ruler, the people were entitled to overthrow him. As d'Holbach wrote in 1767: 'Since the Government draws its power only from the society, and is established only for the latter's good, it is obvious that the society can revoke this power when its interest dictates, and change the form of its government' ([10.8] 1:141). Yet this justification of revolution was always a reluctant one, on Diderot's part at least, and the overriding concern for the rule of law which he and others had expressed in the *Encyclopédie* never left him. In his *Supplément an Voyage de Bougainville,* having demonstrated that the laws governing the structure of society in a country like France were nonsensical, he nevertheless concluded by urging conformity to them, since 'the worst form of society' is the one in which 'the laws, good or bad, are not observed' ([10.3], 2:240).

Most of the major thinkers of the French Enlightenment had died by the outbreak of the Revolution, but it is tempting to wonder what they would have written about it if they had survived. Condorcet, despite ending up its victim, still wrote a work expressing his faith in progress and the perfectibility of man, but one suspects that the humanitarian advocates of freedom and tolerance would for the most part have been somewhat disappointed, at least by the savage later stages of the Revolution. Whether or not their confidence in the progress of science and knowledge would have survived twentieth-century strides in the destruction of the environment and creation of weapons of mass destruction must remain open to conjecture.

CHAPTER 11
The Scottish Enlightenment

M.A.Stewart

INTRODUCTION

The term ‘Scottish Enlightenment’ is used to characterize a hundred years of intellectual and cultural endeavour that started around the second decade of the eighteenth century. Our knowledge of the period is changing, as scholars investigate more of the manuscript deposits and publishers reissue more of the scarcer printed sources. Although I am here concerned with philosophical developments, the Enlightenment was not narrowly philosophical. Scottish historical, legal and medical writers responded to the influence of philosophical debate; philosophers themselves did pioneering work in social science; and the natural sciences and the arts reached new heights of national and international distinction.[1] The Enlightenment should not, however, be defined solely in terms of innovation. There were significant continuities with the previous century, while the challenge of criticism brought a new quality to the work of the best defenders of orthodox tradition.

The controversy surrounding the replacement of the Catholic King James by the joint monarchy of William and Mary in 1688 had reawakened interest in the nature and basis of civil government, and fuelled a certain amount of idealism about the reform of the institutions of state to re-establish ancient ideals of public and personal virtue.[2] The Scottish universities were caught up in this mood of reform, while constrained by the preparedness of those involved to subscribe the Westminster Confession of Faith. William III, faced with the rival claims of episcopacy and presbytery to the control of the Scottish Church, awarded the contest to the presbyterians on the understanding that they appoint ‘moderate’ persons to positions of influence, persons who would avoid pulpit demagoguery and theological witchhunts. The mandate was more easily fulfilled in the universities, where there was greater influence over appointments than in the Church, though an attempt in the 1690s to steer the universities into a uniform national syllabus failed. One reform, introduced piecemeal over the following century, contributed to a temporary superiority of the Scottish over the English universities: the institution of Dutch-style specialist appointments in the different branches of the curriculum.

Scotland was unusual in the degree to which developments in philosophy occurred within, rather than in opposition to, the universities.[3] The main exception is in the work of David Hume (1711–76), who was twice barred, by clerical opposition, from university appointments, at Edinburgh in 1745 and Glasgow in 1752. But Hume interacted with the intellectual establishment, and it will be convenient to build the following account round some of this interaction.

The curriculum was dominated by the three traditional divisions of philosophy: logic

and metaphysics, moral philosophy, and natural philosophy.[4] Logic in the early part of the century was still substantially Aristotelian, sometimes recast in the language of 'ideas', but half a century later Alexander Gerard, Thomas Reid and George Campbell could write of this formal training as largely discredited. Meanwhile rhetoric, another traditional component, was being transformed into the study of belles lettres.[5] A certain amount of epistemology, Cartesian and later Lockean, whose methodology ran counter to that of syllogistic logic, might be added.[6] Metaphysics, even after the decline of Aristotelianism, remained primarily the study of ontology. This could extend, particularly in later usage and among medical writers, to the nature of mind and its modes of operation.[7] The latter was traditionally called 'pneumatology' and was regarded as the foundation for moral philosophy. Moral philosophy was not confined to ethics, for ethics had to be grounded in a thorough understanding of human nature. A century earlier, this had been the prerogative of the theologians, whose emphasis on humanity's fallen state had encouraged a strictly biblical view of moral teaching. The Enlightenment changed this ethos, but the aim of instruction remained one of instilling principles of virtue and good citizenship within a context of general piety.[8]

As for natural philosophy, Cartesianism and the controversies it brought in its wake had become the staple of most universities by the later seventeenth century, but gave way to the science of the early Royal Society by the turn of the century. This was presented in different ways in different institutions, according to the experimental facilities and mathematical expertise available. Some stressed the experimental or at least data-gathering basis of the new science, some its inherently systematic character in reducing diverse phenomena to a body of laws; while all of them in some degree saw the different branches of philosophy as sharing a common methodology.[9]

THE AGE OF HUTCHESON

The official face of reform appears in the increasing use of classical Stoic sources for teaching purposes.[10] These offered a morality attractive enough to the moderate Calvinist mind to satisfy the pedagogical requirement that secular writings should not endanger the faith. Cicero was frequently studied as a Stoic resource, and Scottish editions of Seneca, Epictetus and Marcus Aurelius were reprinted throughout the eighteenth century. Francis Hutcheson (1694–1746) and James Moor (1712–79) collaborated on an annotated translation of Aurelius which was promoted as an antidote to sectarianism.[11] Along with this went a revived interest in natural law—a field where ethics and epistemology converge. Because these studies traditionally related to natural religion, for which the advances in science appeared to be opening up spectacular new vistas, the arts faculties at last found themselves with an integrated agenda for the post-scholastic era, in which, even if they continued to respond to the religious climate of the day, they could re-establish their independence from dogmatic theology.

The natural religion which was particularly in vogue was that of the Dutch Remonstrant tradition of the previous century, which ran from the jurist Hugo Grotius—on whom Hutcheson used to give public Sunday lectures—to the theologian-journalist Jean LeClerc. It had received expression in English through the work .of Henry More,

John Wilkins, John Tillotson and other English divines close to the early Royal Society; while their defences of the biblical revelation had received additional support in the writing of Locke. Locke had argued that the existence of God could be rationally demonstrated, though his handling of the arguments of natural religion was relatively cursory and dogmatic for someone working in the heyday of the Design argument; and he had developed a defence of revelation from his own historical researches. Believers in revelation appeared to have two lines of recourse. They could appeal to personal experience and claim to have been favoured with individual revelations. This, for Locke, gave carte blanche to the 'enthusiast' or fanatic, hence to sectarianism and social division. A personal faith impervious to rational arbitration was a kind of madness.[12] The alternative appeal was to the public revelation of the written, ultimately spoken, doctrine of the Scriptures, validated by the miraculous events contained within their history. But here the same difficulty recurred: when can a miracle story be believed? A rational test was found in the criteria for 'weighing' historical evidence by reference to the quantity and quality of ancient witnesses.[13] One Scot who was influential in insisting on the rational credentials of revelation was Hutcheson's teacher John Simson (1667–1740), who was prevented by the Church from carrying out his office as professor of divinity at Glasgow after 1729.[14]

Besides these overt trends in the curriculum, there was a more clandestine debate, particularly among the students of divinity and law. We find it in the graduate clubs, some of whose members go on to form the nucleus of the professional literary and scientific societies of the mid-century. Four not entirely separate interests can be documented, almost contemporaneously—a sharpened political consciousness, and a fascination with the imported philosophies of Shaftesbury, the deists, and Berkeley.

Politically, it was the Ulster students at Glasgow who made the running. Their disabilities at home made them sensitive to authoritarian administration. Some came, too, with a hostility to theological regimentation, at a time when other young intellectuals, some of them trainees for the ministry, were questioning the Church's continuing role in the oversight of the universities and arguing that religion could as easily corrupt morals as promote them.[15] If they and their fellow students found Shaftesbury's ironic attitude to religious and educational institutions attractive, they were particularly receptive to his argument that religion presupposes morality rather than the reverse; and if that means there has to be an instinctive moral feeling—particularly if it can be shown that this is also the impetus to all that is best in art and literature—then there must be a brighter side to human nature than either traditional theology or recent philosophy had proposed. Gershom Carmichael (1672–1729), the first designated professor of moral philosophy at Glasgow, was no follower of Shaftesbury, but he nevertheless laid the groundwork for this reception, by emphasizing the social nature of humanity, and putting it on a new philosophical footing, as part of a theory of rights founded in the love of God rather than the fear of man.[16]

More radical free-thinkers were also discussed, such as John Toland (himself a Scottish graduate), Anthony Collins, and Matthew Tindal. George Turnbull (1698–1748), who taught at Aberdeen in the 1720s, had gone through a deist phase when he sought to engage Toland, and Toland's patron, Lord Molesworth, in correspondence. His contemporary in Divinity school, Robert Wallace (1697–1771), who was avowedly

utilitarian in his thinking, subjected religious doctrine to moral tests and questioned the intended universality of some Bible precepts. But both used the deist challenge to test the limits of acceptable belief rather than to go beyond them, and both responded to Tindal with defences of the Christian dispensation.[17] The one committed Scottish deist of the period was William Dudgeon (1706–43), who has no known academic connections. He published tracts in the 1730s defending a natural religion whose content was purely ethical. He accepted an afterlife, but denied the reality of sin. In the divinely ordained order, conduct is fully determined by motive, but no motive is inherently evil: error, which is the by-product of our necessary imperfection, can be corrected by self-discipline.[18]

Dudgeon combined this with a Berkeleyan metaphysic which reduced a causally inoperative 'matter' to 'ideas' caused immediately by God, the only autonomous substance, on whom finite intelligences depend. Turnbull also wrote, in the work which grew out of his Aberdeen lectures, as if matter is reducible to perceptions (the dissolution of bodies in death is the end of certain ideas, and the effects of matter upon matter are no more than perceptions excited in our minds). But what he rejected, like many of his contemporaries, was active matter. Its indestructibility as a *passive* object, operations upon which are linked to our minds by laws, is a prerequisite for his argument for immortality.[19]

Thomas Reid (1710–96), Turnbull's most distinguished pupil, is the only individual for whom we can document an initial attachment to outright immaterialism.[20] For others of the period, what caught their fancy was Berkeley's theory of vision—until it was subjected to influential criticism by the physician William Porterfield[21]—and his theological voluntarism: the laws by which the objects of our experience are related are seen as direct evidence of God's sustaining power. These notions were sufficiently congenial that, when Berkeley attacked their other hero, Shaftesbury, in *Alciphron* in 1732, it provoked one former admirer, William Wishart (1692–1753), to violent satire.[22] By this time, however, Edinburgh students were hearing in their logic class that Colin MacLaurin in his natural philosophy lectures had invalidated Berkeley's metaphysics.[23] Andrew Baxter's (1686–1750) defence of the conventional two-substance view of the creation was also influential: he challenged the assimilation of perception with the object of perception and established the stereotype of Berkeley as a Cartesian doubter who never found the way back to reality.[24]

Turnbull's engagement with all these new trends in a single body of writing—deism, Berkeleyanism, liberty in religion, the reform of education, the moral basis of art, moral law, the restoration of civic virtue—has given him an interest for modern scholars which he could not claim in his lifetime, when most of his books were remaindered. Binding them together is a consistent methodology in which all studies can be reduced to laws by a combination of historical and experimental study. Turnbull was already practising this before Hume conceived his own project of 'introducing the experimental method of reasoning into moral subjects', but, significantly, both were pupils of the same 'professor of natural philosophy and ethics' in Edinburgh, Robert Steuart.[25]

Hutcheson was less flamboyant but more influential, a charismatic teacher whose Ulster background contributed to his strong interest in natural and civil rights. The common good is enjoined by the law of nature, and there is a natural right to engage in

whatever mode of action advances this common good. The conventions of social organization are all subordinate to this purpose. Hutcheson's arguments against undue authority in every form made him a leading campaigner, not only for toleration, but against slavery, hereditary power, and so-called 'rights of conquest'.[26] It was probably Hutcheson's version of the contract theory of civil authority, entitling the governed to resist, and if necessary to separate from, whatever power threatened the common good, that had most influence in the American colonies. But what Hutcheson defended as the rights of colonies he also identified as the rights of 'provinces'.[27]

Our concern for the common good and the rights that it entails both reflects and reinforces an instinctive philanthropy that shows itself when we look self-critically at the happiness and misery brought about by different kinds of behaviour. It excites in us an 'esteem' or 'perception of moral excellence' of any action motivated by benevolence. Not all action is so motivated, nor is all appraisal moral; but Hutcheson was best known in his lifetime for this theory of moral appraisal and its aesthetic analogue. He developed it in the four treatises, in two books, composed while he kept an academy in Dublin in the 17205, before he succeeded Carmichael at Glasgow in 1730.[28]

Moral practice was for Hutcheson a matter as much of the heart as of the head, and his work is concerned with both analysing and cultivating the appropriate 'affections'. We have a sense of beauty, which shows itself not only in our appreciation of the arts and mathematics, but in our response to the whole creation as a manifestation of infinite wisdom. The humane affections are as much part of this creation—as much inherent in human nature and independent of social artifice—as size and shape, and almost as readily detectable; and that they are is evidence in turn of the benevolence and intention of their designer.

Hutcheson's account is built round his theory of a moral sense, which is less well articulated than its place in his system requires. The aesthetic analogy drops out in his later writing. Hume believed he had a similar account, when he argued that virtue is a quality of action or character that promotes in persons of normal sensibility a distinctive 'pleasing sentiment of approbation';[29] its being virtuous lies in its promoting such a sentiment, and he then seeks to analyse the sentiment (a kind of love) and its causes (the benefit of those affected). Both agreed we may feel such sentiments even when the act runs counter to our interests. Hutcheson, however, in a work published after Hume's *Treatise of Human Nature,* insists that 'the good approved is not this tendency to give us a grateful sensation' but is independent of and prior to it: it lies in the *source* of the sentiment, which for him is the benevolent affections of the agent.[30]

The St Andrews theologian Archibald Campbell (1691–1756) agreed with Hutcheson that we have an instinctive tendency to social bonds, but instead of attributing this to benevolent motives, he attributed it to the feature Hutcheson disdained: self-love.[31] To some degree this was a verbal dispute, since self-love for Campbell is not a form of selfishness and is not a consideration of advantage. It includes self-esteem, or respect, but it can be gratified through the esteem of others, because the 'self in question is the 'self of Aristotle's theory of friendship, whereby another person can be 'self' to oneself; indeed self-love on this account motivates God as much as humans. Moral virtue is brought about through the love and respect that self-love prompts us to desire and deserve of others, who desire and deserve it of us, creating an amicable society in which there is

mutual esteem. While the phrasing is not ideal, there is a substantive point at the back of it, picked up later by Hume and Kames: benevolence on its own is not enough to engage an agent to any particular action.

Elsewhere, Campbell threatened to challenge the rational religion of the Enlightenment. In *The Necessity of Revelation* (1739), he adopts a basically Lockean epistemology, but takes issue with the idea that the existence of God, the soul's immortality, and the conduct necessary to eternal happiness, can be proved without revelation. God's existence is provable to those who see the evidence. But this evidence was unavailable until within living memory—the Design arguments of antiquity were naive—whereas the foundations of religion must have been open to persons of ordinary comprehension at all periods. The mass of mankind, surveying nature, ascribe supernatural powers to everything, and it requires a revelation to see, with modern science, that that is a mistake. Neither do ordinary persons understand the essence of matter, or how to abstract from experience to form the idea of another immaterial, indissoluble, substance. In section III of this work, Campbell rejects Plato's arguments for immortality as sophistries, and contends that no other of the ancients suspected the soul was immaterial: 'all the great ends of morality and religion are well enough secured without it'. The data of comparative religion suggest that no one attained a doctrinally sound monotheism and its associated morality by reason alone.

But if we are dependent on revelation, we face Locke's problem afresh: how is a revelation to be identified? We cannot simply assume a Deity, or fall back on the word of a being whose existence is in contention. Campbell's solution, in section VII, is bafflingly brief and unimpressive, though a variant on the argument from testimony: he conjectures that an angel 'led on the human mind by rational proofs and arguments' which were communicated in turn to posterity, the moral probity of the source being the factor that carried conviction. We have the evidence of Mosaic history that such a revelation, once given, was corrupted and lost. Campbell is happy to count Pierre Bayle as one of his authorities.

Campbell's strategy had been anticipated by another Scottish theologian, Thomas Halyburton (1674–1712). The deists, Halyburton claimed, cannot pretend that mankind in general subscribe to natural religion: experience is plainly against it. Some have been steered into it by the authority of a small group of thinkers, but on what principles did they recognize the authority of their evidence? Appended to his *Natural Religion Insufficient* was *An Essay concerning the Nature of Faith,* where Halyburton specifically attacked Locke's argument to found faith in reason. It does not fit the scheme of knowledge as intuitive, demonstrative, or sensitive, and conflicts with Locke's claim to accord revelation the highest degree of assent. The external signs (miracles) to which Locke appealed in confirmation of an original revelation did not serve that function. They might deepen the hearers' faith, but most biblical doctrine was delivered without such signs. To do without them is not to fall back on 'enthusiasm': enthusiasm is irrational and at some point conflicts with the evidence of sense and reason. The prophets did not need external signs to recognize God's hand. They had it by an 'irresistible Evidence', like someone who knows an author's style well enough to recognize it in anonymous instances.[32]

HUME'S CRITIQUE OF RATIONAL RELIGION

While this native sceptical tradition was grist to his mill, Hume's own critique of prevailing trends grew out of a wider background, in British and French thought of the previous hundred years and in the main traditions of antiquity; and it is from that background that we must understand his disagreements with Hutcheson.[33] Hume was introduced to Hutcheson in 1739 between the publication of Books II and III of *A Treatise of Human Nature,* and their ensuing correspondence shows an unsuccessful attempt at a meeting of minds. Hutcheson was probably behind at least one of the cautiously critical reviews of the *Treatise* which appeared in the *Bibliothèque raisonnée* in 1740–1. Hume responded to the reviewer's criticisms of his theories of belief, power and the self through the Appendix to the *Treatise,* while in the body of the text he tried to address problems raised by Hutcheson in correspondence, problems which the later reviewer seized on afresh to scotch any suggestion that Hume was Hutchesonian in his moral philosophy. Hume was seen to derive morality from a strictly secular view of human nature, and to analyse it with the unengaged aloofness of a pure metaphysician. He reduced the moral sense to a limited sympathy, and seemed to turn justice into a Hobbesian conventionalism.[34]

These charges returned to haunt Hume in the mid-1740s, when an alliance of clerical interests helped defeat his attempt to succeed John Pringle (1707–82) as professor of moral philosophy at Edinburgh.[35] Hutcheson and another Glasgow colleague worked to avert Hume's election, as did Wishart, principal of Edinburgh University and a life-long supporter of Hutcheson's philosophy. The sceptical aspect of Hume's thought—his stress on the limitations of reason—attracted most attention. He was seen as rejecting the operation of causes and the reality of moral distinctions, indeed as denying our ability to believe the existence of anything; and this despite the lengths he went to, to explain how we all, including himself, unavoidably come to such beliefs. The main target of attack was the supposed implications of his tenets for religious and moral conviction. Hume complained that his philosophy had been traduced, and denied there were anti-religious implications (meaning implications for personal faith) in the argument of the *Treatise*.[36] In rebuilding his defences in *An Enquiry concerning Human Understanding* (1748), he finally addressed the applications of his philosophy to both revealed and natural religion which had been suppressed in bringing the *Treatise* to publication, and this helped provoke some of the first published responses to his philosophy.[37] A fuller critique of natural religion appeared posthumously.

Hume's target is the Lockean scenario presented above, which claimed a *rational* foundation for revealed and natural religion. Hume, like Locke, has no time for the 'enthusiast', and ignores the attempts to immunize personal revelation against criticism.[38] He builds his critique of revealed religion round the question of the historical credibility of the miracle stories associated with the foundation of the main theistic systems.[39] The key concepts in the debate—probability and testimony—link his discussion to Locke. Locke had distinguished the general evidence we have in experience for specific types of phenomena from the quality of the evidence in the particular case—the number and skill

of the witnesses, the consistency and circumstances of the report, the purpose of the reporter, and the nature and extent of contrary testimony. The importance of the particular evidence is in inverse proportion to the strength of the general evidence. Where testimonies conflict with experience, or with each other, we should 'proportion' our assent after weighing the circumstances, and any signs of passion, interest or confusion in the telling.[40]

This epistemology is taken over by Hume in a way that defeats Locke's attempt to plead a special case for biblical miracles. To believe in a one-time exception to the order of nature, we must be aware of an exceptionless order to constitute the law from which the departure occurred. The type of evidence needed to establish the norm destroys our ability to identify the exception, for which the evidence is at best derivative.[41] And yet Hume is not impugning the *concept* of miracle. A miracle is 'a transgression of a law of nature by a particular volition of the Deity, or by the interposition of some [other] invisible agent'.[42] The laws are what operate (by God's general providence) in the absence of such transgressions (or particular providences). The problem is one of detectability.

Hume presents it as a problem of matching proof against proof. He accepts with Locke that the regular sequence of cause and effect offers the highest degree of empirical proof. So we have proof of tomorrow's sunrise from uniform past experience, though there is no logical absurdity in suggesting it will not rise; and we have comparable proof of any law of nature from comparable natural uniformity. In this sense there is 'proof against any miracle.[43]

The potential counter-proof cannot claim direct evidence of divine intervention. It consists in looking for evidence of the reliability of historical witnesses—witnesses with as much proven reliability as other people's experience of the laws of nature. Hume depicts it as an outweighing in numbers, calculated by subtraction, and illustrates it by the way that witnesses to one side in a legal case can offset those for the other side. It is difficult to make sense of this notion of subtraction for the case in hand, and some of his criteria remain clearly qualitative.[44] Appealing to all the weaknesses that Locke identified in human testimony, Hume argues that there is no case where the quantity and quality of the witnesses have met the required standards. One hypothetical case would give him pause: if people came in sufficient numbers from all corners of the earth testifying to a week's darkness, he would accept that as evidence of something unusual. But he would not leap to a supernatural explanation.[45]

Locke could make that leap, because he accepted the tradition, established by Bacon, that miracles were not intended to convert atheists. The theist has already accepted the arguments of natural religion, and considered that these lead to a being who would wish to communicate with the sentient creation. Miracles are there to establish a particular system, within an existing framework of belief. Hume challenged this strategy on two fronts. First, a miracle can 'never be proved, so as to be the foundation of a system of religion'. No matter how worthy the witnesses, they could not show that an appeal to supernatural power—an appeal necessarily outside our experience—was our only recourse.[46] Secondly, reason is incapable of establishing the kind of Deity whose revelation is being postulated.

This brings us to the second limb of Hume's critique of rational religious belief: the

critique of natural religion. Because his fullest treatment of this is presented as a dialogue sequence, one must be alive to the limitations of the genre.[47] The views that Hume sets up for critical scrutiny are little more than stereotypes. But a number of factors support the verdict of his contemporaries that the character of Philo in the *Dialogues concerning Natural Religion* is more than a 'careless sceptic' and is predominantly Hume's mouthpiece, even sharing his characteristic irony. In the first state of the manuscript, some 60 per cent of the work was assigned to Philo; 85 per cent of the subsequent revision belongs to Philo, including the additions of Hume's last months.[48] He invested his labour overwhelmingly in Philo's side of the case. Furthermore, even at the time of the *Treatise,* he had sketched out a narrative study, in which he developed in his own person an argument similar in structure to Philo's in the *Dialogues,* and identical in substance on the one topic where comparison is still possible—the problem of evil.[49]

All parties to the *Dialogues* accept the existence of a 'first cause', but this does not commit them to a meaningful theism.[50] It opens up the debate over whether anything can be known of the attributes of an entity so removed from experience. The main focus of discussion is the Design argument, espoused by the character Cleanthes, and presented in the form of an analogy. The world is an integrated system of interacting 'machines', in that their essential feature is 'the adaptation of means to ends' through an 'order, proportion, and arrangement of every part' according to regular laws. From a similarity of effects (the adaptation of means to ends both in artefacts and in the works of nature) Cleanthes infers a similarity of causes (reason and intelligence).

'Machines' here does not have narrowly mechanistic associations.[51] The emphasis is on organic nature—the structure of legs and eyes, and biological, psychological and social circumstances that combine to support human reproduction. Cleanthes, under pressure, goes on to try to make a virtue of the logical weaknesses exposed by Philo, by self-consciously emphasizing the 'irregularity' of the argument—that is, its power to carry more conviction than its logic warrants. The 'idea of a contriver' strikes us 'with the force of sensation' when we dissect the eye.[52] It is like hearing or reading a familiar language, where the recognition of intelligence is, or would be, instantaneous even in bizarre conditions. Everyone sees that the recognition in the linguistic case is sound, and this should inspire our confidence in the other. Although the analogies of immediate recognition are offered by Cleanthes, at the beginning of Part III, as so many 'illustrations, examples, and instances' to reinforce the 'analogy between their causes', they are better seen as a commentary on it, and as a rhetorical attempt to circumvent Philo's insistence on case-by-case assessment.

The discussion develops round a distinction between God's natural and moral attributes. The natural attributes relate to intelligence and power, and would pertain to a Deity in any circumstances, whether there had been a creation or not. The moral attributes arise from a freely chosen relationship with sentient creatures. Most of the debate is over the natural attributes, and involves three contentious issues.

First, most fundamental, is whether 'order, arrangement, or the adjustment of final causes' is the 'proof of design' that the argument requires. Philo contends that we cannot see things in cosmic perspective and can only infer design in the kinds of cases we know from experience; order and arrangement are not, themselves, *kinds* of cases. But if it is a condition that the manifestations of design be recognizably analogous to that in human

artefacts, we shall end up ascribing human characteristics to divinity.[53]

Second, we cannot from experience prove the ultimate priority of ordering mind over ordered matter. Perhaps mind needs to be and can be explained in turn through natural causes; while this is contrary to a common assumption of the time, it is a live issue for those who admit that the essence of matter and mind is unknown.[54]

Third, the evidence of experience is that there are many 'springs and principles' in nature, and different kinds of order. There is an absurdity in taking any singly as the model for all nature. If we do, we have no worse reason to see the world as an ordered animal, or vegetable, than to see it as an artefact; while even a disordered world must have its parts so structured that they would in due course shake out into some sustainable pattern.[55]

To these challenges to God's natural attributes, Philo adds a version of the problem of evil. In reasoning from experience we cannot attribute to the cause qualities that are not provable by the effects, and the calamities of human and animal life give no support to belief in the moral attributes of the creator. The committed theist can accommodate this problem, but what is at issue is what we can infer without that commitment. Hume argues through Philo, and in his own person in the early fragment, that the balance between the frequency of pleasures and intensity of pains is such that no determination of whether there is moral purpose in nature is possible.[56]

Thereafter, in the final Part of the *Dialogues,* Philo somewhat relents, and concedes that, whatever the limitations of our understanding, the psychological pressures to believe in *something* are very considerable. But it is a qualified concession, and nowhere more so than in the longest paragraph of the work, the only significant addition from Hume's last weeks of life, and thereby his dying testament to posterity.[57] The dispute between theist and atheist, it is argued, is 'verbal'. The theist grants the nature of God's mind to be incomprehensible; the atheist concedes a remote analogy between the orderings of nature and intelligence—not, however, moral intelligence in the human understanding of the phrase. Each from their opposite position must consider the analogy so attenuated that neither has the means to make it more precise or useful.

The critical arguments of the *Dialogues* have found most of their admirers in the twentieth century, but only after Darwinism changed scientific attitudes to the study of nature. In the short term, Hume's critique stimulated a number of forceful apologists, of whom the most successful was the English theologian William Paley. Modern commentary portrays Paley's *Natural Theology* (1802) as a reactionary work written in ignorance of Hume, but careful study of the language and logic of his opening chapter shows it is a systematic riposte, item by item, to many of Hume's moves. Because Paley builds into his exposition of the Design argument the limitations that Hume's critique imposes, Hume's criticisms have no particular target in his work.

As for Hume himself, where we fail to find adequate reasons for a belief we may still explain its causes. The belief in God is not one of those fundamental to 'common life', where the mechanisms of the mind compensate automatically for the deficiencies of reason. Indeed, the ordinary mind does not have the synoptic view of nature that—unlike Paley—Hume supposes essential to the theistic perspective. Hume explores the roots of religious belief in *The Natural History of Religion,* which presents a logical reconstruction of popular thought in the guise of a series of historical steps.[58]

Hume argues that humanity develops from a state of ignorance motivated by hope and fear. This hope, and more particularly fear, is directed to the unknown causes of human fortune, which come to be personified as unseen rulers. Hence polytheism. From that arises the idea of a chief ruler, to whom virtues are ascribed by way of flattery, while their servants amass exaggerated honours. There is a 'flux and reflux' in the popular mind, between polytheism and monotheism, the former tending towards toleration and social virtues, the latter towards authoritarian control and a moral abasement that runs contrary to human nature.[59] This 'vulgar' superstition is contrasted with the sophisticated insight of the minority—Hume ironically includes Adam in Paradise—who appreciate the connected order of nature and derive from it a more fitting and consistent view of the divine character.

Though written from a contrary perspective, Hume's account of 'vulgar' religion is largely consistent with contemporary Calvinist teaching about human belief since the Fall, where it was a commonplace, as we have seen, that monotheism is not a position that comes naturally to the unaided mind.[60] His writing was a greater challenge to those who favoured the claims of natural religion, because he seemed to show that they could never carry the bulk of mankind with them. But it had a direct influence on William Robertson (1721–93), leader of the Moderate Party in the Scottish Church, whose accounts of primitive religions follow Hume's specification.[61]

One frequent element in religious belief, which commonly links it to moral practice, is the belief in immortality. Hume examines this in a posthumous essay, 'Of the Immortality of the Soul', which first recapitulates the argument on immateriality in the *Treatise*.[62] Philosophers had often contended that thought, as immaterial, must inhere in an immaterial substance, which by its nature lacked the power to disperse. Hume responded that we have no experience of the substance of anything, so cannot show that any given properties are essential to it; while the doctrine of an indivisible soul-stuff seems to carry with it the implication of an undivided substance throughout nature—a thesis beset with paradox. In the essay, he adds further objections. Assuming the orthodoxy that immortality is bound up with reward and punishment (which liberal thinkers already disputed), he focuses on the apparent disproportion between the petty conduct of most human life and the eternal after-effects. Furthermore, all the analogy of nature is against there being something that resists the processes of change; indeed, we have the evidence of experience that the mind declines as well as the body, and in parallel with it.

THE RESPONSE TO HUME

The first significant response to Hume's philosophy within Scotland came with the *Essays* of Henry Home, Lord Kames (1696–1782), in 1751. Its criticism was sufficiently muted that some contemporaries saw little to choose between them, despite Kames's support for natural religion. A flurry of pamphlets in the 1750s, aimed at both thinkers and their circle, repeated the charge that Hume's philosophy, and now Kames's, was a threat to morals and religion, but it failed to advance the debate philosophically. On the periphery of this controversy was another dispute with theological ramifications, between

Kames and John Stewart, natural philosophy professor at Edinburgh, over whether Newton's admission of mechanical forces was tantamount to conceding activity to matter.[63]

Kames's reading of Newtonianism as a necessitarian system seemed to open the way to fatalism and the denial of providence, particularly when he characterized the sense we have of human liberty as a kind of divine 'deceit'.[64] Within this framework, Kames nevertheless offered a balanced picture of human motivation. 'Self-love operates by means of reflection and experience' and belongs to the calculating part of our nature, guided by considerations of pleasure and pain. But our appetites and affections do not directly correlate with pleasure and pain. Grief and compassion move us alike in real life and in the arts, and our ability to be drawn to what is painful, and be stimulated by it to delicate feelings, is a sure sign of our social nature. This nature forms the basis of the laws to which we are subject, and which we discover through the instinctive responses of our moral sense to the beauty or deformity of human character and action.[65] Kames thought, however, that neither Hutcheson nor Hume gave sufficient attention to the sense of duty and justice, which he traced to a distinctive feeling, without which the trust that holds society together could never have arisen.

Kames considered the deceptiveness of moral liberty no different in principle from the 'unreality' of secondary qualities. It is consistent with the great design that God should present things in the way best suited to his purposes for mankind, while still enabling us to discover the underlying reality. Berkeley, who might have contemplated a similar argument, was one of his targets here, and Hume another. For Kames it would be more than divine deceit—it would be a totally pointless assignment of useless faculties—if our senses did not put us in touch with a material world. Our perceiving observable qualities as aspects of a whole is proof that we have a sensory impression of substance, that is, of 'independent and permanent existence'. Equating belief with a simple, unanalysable feeling, he considers there is no appeal against our sense of the externality and power of observed objects; if they are indeed external, and have the power they appear to us to have, no better way of conveying this can be conceived than the way we actually experience them.[66] Our sensitivity to the presence of God in nature is accounted for on similar principles.[67]

Kames's appeal to a 'feeling' which opposes any philosophical scepticism with regard to an objective order—an appeal, in fact, to the concurrent operation of external and what he sometimes calls 'internal' senses—has been seen as an extension into the metaphysics and epistemology of Hutcheson's concept of an inner sense in morals. If so, it is a stage towards the 'common sense' theory developed among the members of the Aberdeen Philosophical Society, in part, again, in reaction to the scepticism of Hume.[68] Because the 'common sense' theory is a theory that accounts for those fundamental convictions which both parties placed outside the province of, reason, and which Hume attributed in certain cases to 'natural instinct', the difference between them has sometimes seemed merely verbal. But natural instinct in Hume —as it relates, for example, to belief in the self and the external world, the identification of purposive behaviour, and the operation of causes—is something brought about by the natural processes of the mind *consequent* to experience, and is not inherent in that experience; and it does not extend to a religious instinct.

The first salvoes against Hume's philosophy to be publicly fired from Aberdeen originated from the pulpit. George Campbells (1719–96) *Dissertation on Miracles* is intended to demonstrate the rational basis of revealed religion. Its two parts match the sections of Hume's critique, assessing first the a priori case, then the a posteriori case, for miracles.

Campbell argues that 'testimony hath a natural and original influence on belief, antecedent to experience', but we learn, by experience, to regulate our confidence in it. The predisposition to accept testimony is a feature of our 'common sense', one of the original 'grounds of belief, beyond which our researches cannot proceed, and of which therefore 'tis vain to attempt a rational account'. Belief in the uniformity of nature, and in the prima facie reliability of memory, is of this kind. 'If we had not previously given an implicit faith to memory, we had never been able to acquire experience', notwithstanding that memory, like testimony, can be corrected by experience.[69]

The unusualness of an event, Campbell concedes, may be a presumption against its authenticity, but cannot always be so. If I have had two thousand experiences of a ferry boat making a safe and regular crossing, then one day meet a stranger who gravely reports he has just seen it lost with all on board, I am likely to give more credence to this than Hume's simple subtraction formula would authorize. This holds until sufficient counter-evidence is found, either from other witnesses about the fact, or from witnesses about the witness. Hume had tried to weigh incommensurables; and whether past experience is a sound guide to a new case depends not only on how far relevant circumstances are the same, but on whether they are known.[70] Hume himself ran into inconsistency in exploiting testimony to help establish the laws of nature while discounting it in cases of alleged violations, and in dismissing untested any reports that he considered religiously motivated.[71] Campbell scores some sound points against Hume's logic, but sometimes misreads his irony, and is less effective on the decisive question of how one would identify divine intervention.[72]

Thomas Reid likewise criticized Hume from common-sense principles, but took as his target Hume's critique of natural rather than revealed religion. He claims to detect 'first principles of necessary truths', principles 'of which we can give no other account but that they necessarily result from the constitution of our faculties', in grammar, logic, mathematics, taste and morals, but he is mostly concerned with metaphysics.[73] Hume properly showed that we cannot derive, either from experience or reason, the belief in material and mental substance, the principle of universal causation, or the certainty 'that design and intelligence in the cause may be inferred from marks or signs of it in the effect'. Any attempt to do so already assumes the principles in question, so, argues Reid, they must be self-evident. In regard to other intelligence, the case for the existence of God is no different from the case for other minds generally.[74] Hume had argued in *Enquiry* XI that we cannot infer an intelligent cause for the universe because we have had no experience of the origin of other universes. Reid retorts that 'according to this reasoning, we can have no evidence of mind or design in any of our fellow-men', either, since we have never been able to match their wisdom against its visible signs. The role of these signs is not, therefore, to form the premises for inductive argument. It is part of the providential design for human life that they are transparent.

Hume got into the sceptical impasse, in Reid's view, because he was obsessed with the

principle that there are no ideas without preceding impressions, and no impressions appropriate to the case. Hume's failing is, however, part of a broader failing of the philosophical tradition since Descartes, which Reid castigates as the 'theory of ideas'. This is the attempt to build up an account of human knowledge entirely through an account of the atomic contents of experience. But these contents in themselves never reach to the world of which we claim the knowledge, so the project is self-defeating. Reid draws a clear distinction between the study of the body and its relations with other bodies, which may give us a natural history of the senses, and the anatomy of the mind, by which we obtain a history of human consciousness;[75] and he sees an obvious absurdity in supposing either that the second is in some way a representation of the first, or—if the absurdity of that is granted—that the first is then beyond our reach. There are limits to our knowledge of the physical world, and to our knowledge of the mind, but there is a kind of philosophical 'madness' in confusing the one with the other.

In place of the theory of ideas, Reid postulates a distinction between sensation and perception. His formulation of this remains obscure, and has been adapted to serve the interests of different modern theorists. Sensation is an affection or feeling of the mind, quite unlike any physical quality: it can exist only in a sentient being. (Thus the sensation we feel from impact with a hard body is merely a sign. It has nothing about it that corresponds literally to the compactedness of the particles of that body.) But it 'suggests', or brings about a 'conception and belief of, an external reality. The notion of suggestion is taken from Berkeley's philosophy of vision, but Reid rejects any idea that it is an acquired association: there is no way such an association could arise if it is not inherent in our make-up, although he does allow that the way we learn to judge specific sizes, shapes and distances by sight takes time. Perception is the awareness we have of the existence of external objects by our senses.

Reid's work is imbued with a pleasant wit. Of the principal items that make up his *Philosophical Works,* his *Inquiry into the Human Mind* (1764), in which he first stresses the distinction between physical and mental enquiry, is a minor classic, while his *Essays on the Intellectual Powers of Man* (1785), completed after his move to, and retirement from, Glasgow, is a comprehensive study on a grand scale. Of the other members of the Aberdeen circle, the moralist and belletrist James Beattie (1735–1802) made most noise in his day by his fast-selling *Essay on the Nature and Immutability of Truth,* which incurred the censure of Kant. This attack on scepticism, largely targeted at Hume, is vaguely concerned more with the criteria than the nature of truth: he vacillates between conceiving truth as something eternal, and as a variable property ('certain truth', 'probable truth') of individual judgements. We attain truth in proportion to the degree to which we believe what the 'constitution of human nature determines' us to believe. Sometimes this comes from reasoning or evidence; sometimes (where those can add nothing to what is already there) 'by an instantaneous, instinctive, and irresistible impulse; derived neither from education nor from habit, but from nature'. This, again, is 'common sense', upon whose axioms all proof is founded and to which all truth is conformable.[76] Beattie does not follow Reid deeply into the theory of perception, and his work is coarser in tone, sniping at the 'irreligion' and 'licentiousness' he sees ensuing, once the defences of common sense are breached by philosophical scepticism.

The common-sense tradition itself, by its apparent preoccupation with the anatomy of

the mind, came to be criticized on similar grounds, by a logic that is now difficult to reconstruct. It was left to Reid's most gifted student, Dugald Stewart (1753–1828), an inspirational teacher who was professor of moral philosophy at Edinburgh from 1785 but ceased to be active after 1810, to redeploy this philosophy just as the infiltration of Kantian ideas (still ill understood) began to have its impact; but Stewart's most original work was in political economy.[77] The 'Dissertation' which he contributed to the fourth and later edition Supplements to the *Encyclopaedia Britannica* from 1816 was a history of metaphysics since the Renaissance, and included research into documents now lost. As a historian Stewart could not shake off the standpoint of the 'Scottish' philosophy, and indeed used the history of philosophy as a means of vindicating that tradition. In doing so he helped perpetuate certain stereotypes that have outlasted his own philosophy. One is the view that Hume subscribed to a 'constant conjunction' analysis of causation which denied any necessitation in nature. Stewart willingly endorsed this, as a death-blow to Spinozism.[78] He also approved Hume's demonstration that there can be no proof of universal causation or of the uniformity of nature, since this gave the common-sense philosophy its needed opening. So when there was opposition to a mathematical appointment at Edinburgh in 1805 because the nominee, John Leslie, had endorsed Hume's supposedly irreligious view of causality in natural philosophy, Stewart was active in his support. (So were the evangelical party in the Church, who accepted Hume's proof that faith was beyond reason.) Stewart contended, indeed, that Hume's analysis was not only commonplace, but had been commonplace before Hume.[79] But this needs qualification. What Stewart favoured was the view of Clarke and Berkeley that the active agents are minds, and what is popularly conceived as agency in nature is no more than constant conjunction according to the laws of a lawgiver. As Reid had already expressed it, 'We perceive no proper causality or efficiency in any natural cause; but only a connection established by the course of nature between it and what is called its effect. Antecedently to all reasoning, we have, by our constitution, an anticipation that there is a fixed and steady course of nature: and we have an eager desire to discover this course of nature'.[80]

Stewart's deputy after 1810, Thomas Brown (1778–1820), had also contributed to the Leslie controversy, with a tract on the 'nature and tendency' of Hume's doctrine. He supports a constant-conjunction account of cause, but also endorses Hume's view that whatever account is given of physical causation applies equally to mental causation. He denies that we have any distinct sense of mental power. However, that the relation of cause and effect is not discoverable a priori, or by reason, but is an object simply of 'belief (that is, a belief with regard to future contingencies), he sees as compatible with the common-sense appeal to an 'instinctive principle of faith'.[81]

Brown's defence of Hume called forth the talents of the principal woman writer to have a place in the philosophy of the Scottish Enlightenment—Lady Mary Shepherd (1777–1847), daughter of the third Earl of Rosebery. After a book on causality she published another primarily on perception, where additionally she addresses the views of Berkeley, Reid and Stewart.[82] She is anxious to obviate any threats to theism, whether from a revisionist view of causation or from doubts about material existence, and she seeks to restore to human reason whatever Hume had attributed to associative instinct and others to common sense. Try to conceive an effect that was not necessarily linked to (in

Shepherd's terms, 'inherent in') its cause. Can it, then, begin its own existence? But such beginning is an action, and an action can only be the action of something already existing. An effect is a difference occurring in an existing situation, but it cannot begin of itself if there is nothing to 'make' a difference: by 'reasoning upon experiment', whether in laboratory study or ordinary life, we establish a difference in the attendant circumstances. Single experiments are often sufficient, except to narrow down the circumstances in which the cause is operative, since it is contradictory to conceive that the course of nature might change.[83] However, the factors we observe are strictly effects or signs of the underlying reality, and it is the latter that is subject to the laws of nature: Hume's mistake in conceiving laws of nature as generalizations from experience undermines his strategy over miracles.[84] Her second book tries to show why we must accept that there are efficacious but unknown causes that do not have the character of mind. Mind, she holds, supplies the conditions for sensation in general, but only when there is something else that acts upon it does sensation actually occur.[85]

The common-sense tradition had also involved itself in moral theory. The intellectual powers were traditionally paired with the active (or 'active and moral') powers in that analysis of human nature which was the propaedeutic to moral instruction; and the textbooks and lecture courses of the day all surveyed the nature of human action, the role of appetite, desire, affection and passion, the nature of the moral faculty, the principles that influence moral conduct, and those that regulate it. This was considered an essentially scientific enterprise. The language of a 'moral sense' is retained, if by some, like Stewart, apologetically. Reid equates it with conscience, and introduces it into the discussion of the sense of duty, rather than, as in Hutcheson, the sense of good. His account echoes his account of 'common sense':

> All reasoning must be grounded on first principles. This holds in moral reasoning as in all other kinds. There must, therefore, be in morals, as in all other sciences, first or self-evident principles, on which all moral reasoning is grounded, and on which it ultimately rests.

Thus there is no reasoning with someone who does not acknowledge the Golden Rule: you can appeal to his sense of interest, but not his sense of duty.

> To reason about justice with a man who sees nothing to be just or unjust, or about benevolence with a man who sees nothing in benevolence preferable to malice, is like reasoning with a blind man about colour, or with a deaf man about sound.[86]

But we may reason about specifics, for example for and against particular family arrangements. By this time, however, the focus of interest in moral psychology had shifted to the analysis of agency, and to theattempt to understand human power as the ability to act in conformity with judgement.[87]

It was outside the common-sense tradition that Scottish moral philosophers in the eighteenth century made their strongest mark. Adam Smith (1723–90) at Glasgow and Adam Ferguson (1723–1816) at Edinburgh—both of whom would become widely

travelled scholars with an international circle of acquaintance—carried the analysis of human nature well beyond its customary applications in the moral sphere.[88] Breaking the taboo on the analysis of self-interest, Smith made a landmark contribution to the study of the workings and place of economic forces in society, albeit with a normative purpose—the defence of freedom of action, including freedom of competition and freedom of trade. However, although he advocated governmental regulation only in matters relating to the protection of society, he did not deny the duty of government to provide basic public services. Where Smith's researches into moral and economic conduct led him into two complementary studies, Ferguson had space to integrate the subjects into a single work, in which he saw the existence of moral sentiment as foundational to society. Ferguson's work is always informed by a strong sense and knowledge of history, whether real or conjectural, and particularly in his conscious rehabilitation of the social ideals of antiquity, which he forcefully distinguished from modern book-learning about them.

In his own moral theory, Smith had laid great weight on the classical notion of sympathy as the source of social ties.[89] Hume had already revived this idea, in seeking a more convincing mechanism than the instinctive philanthropy of Hutcheson. Smith considered that we are endowed by nature with a twofold sympathy which is reflected in moral judgement. We may sympathize with agents who act from a virtuous motive, and thereby approve their conduct. We may also sympathize with the gratitude of the person who benefits from the virtuous conduct (or if it is not virtuous, we may sympathize with their resentment). This is not the same as simply sharing their sentiments, although we naturally seek to do so. It is an exercise of imagination, and can therefore vary in degree from individual to individual.[90] But it can also be trained, in the way that we naturally adapt to the responses of others. (This does not entail blind conformity: we can be out of step with popular sentiment where we have a better, or worse, command of the facts of the case.) But if it were simply a matter of thinking ourselves in other people's shoes this would not explain how we can also assess our *own* actions. We do this by becoming 'impartial spectators', seeing ourselves as others would see us, if they were fully apprised of the facts. Society therefore serves as a mirror through which we come to scrutinize our own conduct. And in the interaction generated by the operation of sympathy we learn to develop two characteristics essential to the moral life—self-command, and compassion or sensibility.

1 Sher [11.103], 329–76, offers an excellent bibliographical guide to this wider field.
2 One form of this idealism is found in the 1690s in the political pamphleteering of Andrew Fletcher (1655–1716), a Scottish correspondent of Locke, whose experience in exile led him to favour a Dutch type of confederacy for Britain. Fletcher's extolling of a mythic 'Gothic' past in which there was sufficient balance of political power to ensure the liberties of the subjects is a forerunner of early Enlightenment attitudes. But he represented an idiosyncratic nationalism that was out of line with the anglicizing stance of most eighteenth-century Scottish intellectuals.
3 There were five universities. St Andrews, Glasgow, and King's College, Aberdeen, were late medieval papal foundations. Edinburgh and Marischal College, Aberdeen, were local political creations of the post-Reformation period. Present information is sparsest on eighteenth-century St Andrews.
4 There were, additionally, foundational studies in classical languages, seen also as a source of moral instruction; and mathematical training became increasingly important as a requisite for natural philosophy. During the eighteenth century, civil history, often considered as an extension of natural history, came to be regarded as a significant source of data for the study of morals.
5 George Campbell [11.22] runs somewhat against this trend. His work is distinctive for founding its discussion of eloquence and the grounds of conviction in the study of 'human nature', and for three chapters on logic, both formal and informal.
6 Duncan's popular tutorial manual [11.27] provides an example of this synthesis.

Reform', in Carter [11.90], 95–103; and M.A.Stewart, 'Berkeley and the Rankenian Club', *Hermathena* 139 (1985): 25–45.

18 Dudgeon, *The State of the Moral World Considered,* 1732 and *A Catechism Founded upon Experience and Reason,* 1739, in *Works* [11.25]. Cf. Carabelli [11.112], 197–206. Raphael [11.145], 36, suggests that Adam Smith was also a deist. So, almost certainly, were some of the philosophically minded scientists in the later part of the century, like William Cullen (1710–90) and James Hutton (1726–97).

19 Turnbull [11.80], ch. 9. Turnbull's examples reappear in George Wallace [11.82], 42.

20 Reid [11.62], 162.

21 Porterfield [11.57], 214–33. Rejecting Berkeley's view that our judging of distance by sight is due to 'custom and experience', Porterfield sees as the only alternative an acknowledgement of 'an original connate and immutable Law, to which our Minds have been subjected from the Time they were first united to our Bodies'. Such a law is already implicit in Berkeley's appeal to touch; and if we accept it in relation to one sense, it is more, not less, economical to accept it for a second. So, he supposes, the mind 'traces back its Sensations' through the retina along the 'perpendicular Lines' described in optics—never addressing the difficulties Berkeley found in this suggestion. The language of ideas obscures the fact that Berkeley must hold that vision causes us only to *imagine,* not detect, a tangible distance. Porterfield's analysis of the problem led Reid to his distinction between sensation and perception, discussed below.

22 Wishart [n.86]. Patrick Hardie of Aberdeen, the first Scot to mention Berkeley in print (1719), and perhaps the first to discuss him in the classroom, was an exception to the view of Berkeley as a friend to religion: Wood [11.106], 38.

23 Stewart, 'Berkeley and the Rankenian Club' (above, n. 17).

24 Baxter [11.6], vol. 2, sect. II.

25 On Steuart, see M.Barfoot, 'Hume and the Culture of Science in the Early Eighteenth Century', SPSE, 151–90. On Turnbull, see J.Laird, 'George Turnbull', *Aberdeen University Review* 14 (1926–7): 123–35; Norton [11.120], ch. 4; Stewart, Turnbull and Education' (above, n. 17).

26 Hutcheson, *System* [11.50], Bk. III. He first published these views in a Latin class manual, translated posthumously as *A Short Introduction to Moral Philosophy,* 1748; but the underlying theory of rights was already developed by 1728, in the second edition of the *Inquiry concerning Virtue* [11.48], sect. VII. The political argument against hereditary guilt also challenged the theological doctrine of original sin.

27 C.Robbins,' "When it is that Colonies may Turn Independent" ', *William and Mary Quarterly,* 3rd series, 11 (1954): 214–51. In his *System* (vol. 2, p. 232), Hutcheson even allows release from the obligation to comply with a policy implemented by consent, if its effect is contrary to the one intended.

28 These are reprinted as vols 1–2 of Hutcheson's *Collected Works,* Hildesheim, Olms, 1990.

29 Hume, *Treatise* [11.45], III. i. 2, which he could reasonably consider modelled on Hutcheson's remarks on beauty, *Inquiry* [11.48], sect. I.

30 Hutcheson, *System* [11.50], 1:53. Cf. *Illustrations* [11.46], sect. IV. The difference between Hutcheson and Hume here is a difference over their interpretation of the theory of secondary qualities—whether in the mind or in the object—to which virtue and vice are being assimilated.

31 Archibald Campbell [11.19]. For Hutcheson, benevolence and self-love were conflicting motives, the one moral, the other amoral. It required rational reflection and self-discipline to cultivate the one and counteract the other.

32 The ultimate authority here would have been Calvin's *Institutes of the Christian Religion*. A similar orthodox defence of inspirational religion, seen as distinct from enthusiasm, was developed by Moncrieff (above, n. 14). The Miracles of Christ and his Apostles are to be believed, because contained in the Scriptures, and not the Scriptures because of them' (*Remarks,* p. 56). Otherwise Moncrieff could not be sure why the miracle reports in Josephus were ridiculous, and those in the Gospels not.

43 E, 56n., 115; cf. 127.
44 E, 122. Cf. George Campbell [11.21], 21–30.
45 Hume used similar tests, elsewhere, to appraise the claims to inspiration made on behalf of Joan of Arc and the claims to historical authenticity made on behalf of the Ossian forgeries. Another who felt the need to defeat whatever threatened established regularities was Pringle [11.58], who contested the evidence for meteorites.
46 E, 121, 129.
47 Carabelli [11.112], esp. ch. 3; M.Malherbe, 'Hume and the Art of Dialogue', HHC, 201–23; M.Pakaluk, 'Philosophical Types in Hume's *Dialogues*', PSE, 116–32.
48 I owe these calculations to Ruth Evelyn Savage.
49 M.A.Stewart, 'An Early Fragment on Evil', HHC, 160–70.
50 Hume sometimes calls this minimal belief and the practice of virtue 'true religion'. This is not a body of doctrine, or a practice of worship. The same lip-service to the traditional cosmological argument in *Dialogues* Part II is consistent with the speakers' subsequent disagreement over the 'demonstrative' formulation of such an argument in Part IX. See M.A.Stewart, 'Hume and the "Metaphysical Argument *A Priori*"', in A.J.Holland (ed.), *Philosophy, its History and Historiography,* Dordrecht, Reidel, 1985, pp. 243–70; E.J.Khamara, 'Hume *versus* Clarke on the Cosmological Argument', *Philosophical Quarterly* 42 (1992): 34–55.
51 D, 45. Such associations were expressly repudiated by George Cheyne [11.23], 2, the

Scottish Newtonian from whom Hume drew the description.

52 This formulation (D, 56) draws on another Scottish Newtonian, MacLaurin [11.53], 381, and foreshadows Reid [11.62], 460.

53 D, 47, 50, 52, 58, 68–71. Hurlbutt [11.117] has introduced an influential misunderstanding into Hume's exegesis by suggesting a sense of 'design' in which the detection of design becomes a *premise* of the Design argument. This reduces it to triviality. The argument scrutinized by Hume takes as its premise the existence of a certain kind of *order* in nature, and seeks to show, by analogy, that order of this kind is evidence of design.

54 D, 62–6, 84–5.

55 D, 72–3, 78–9, 85–7. Cf. Hume's account of polytheism, as a response to the diversity of phenomena, *Natural History* [11.42], 139.

56 D, 96–7, 102–3. This was always for Hume the main obstacle to theism; and as his correspondence with Hutcheson shows, he had problems understanding what it could mean, on his own secular analysis of morals, to ascribe virtues to the Deity. An alternative interpretation of the preponderance of pain is found in Baxter [11.6], who used it as evidence for a compensating immortality.

57 D, 119–21.

58 Hume himself disparaged one common application of this technique, the 'contract' theory of society. Dugald Stewart later recommended the practice as offering a truer insight into the nature of human institutions than a correctly documented narrative history. He called it 'conjectural history' and cited Hume's *Natural History* as a paradigm. It is important to see, however, that Hume was speculating not on the first origins of religion, but on its recurrent origin in human nature, wherever it occurs. Cf. S.Evnine, 'Hume, Conjectural History, and the Uniformity of Human Nature', *Journal of the History of Philosophy* 31 (1993): 589–606; R.A.Segal, 'Hume's *Natural History of Religion* and the Beginning of the Social Scientific Study of Religion', *Religion* 24 (1994): 225–34

59 A similar picture of historical religion is found in Hume's *History*. See Bernard (above, n. 12).

60 Hume used the same tactic, ironically, in concluding his discussions of miracles and of immortality.

61 William Robertson, *History of America,* 1777, *Historical Disquisition concerning the Knowledge which the Ancients had of India,* 1791. In the appendix to the latter, Robertson's depiction of the 'Stoicism' of the Brahmins has Humean echoes.

62 Hume, *Essays* [11.44], 590–98; *Treatise* [11.45], I. iv. 5. The essay is partly targeted against Joseph Butler's *Analogy of Religion,* 1736.

63 Wright [11.123], §16.

64 Henry Home, *Essays* [11.39], 1st edn, 207–18.

65 Ibid., Pt I, essays 1–2.

66 He supports this by comparison of the different senses: because some involve contact with the object sensed and others do not, we have intuitive evidence of the distinction between perception and the object perceived.

67 Ibid., Pt II, essays 1–4, 7. For the Hume-Kames relationship, see Norton [11.120], ch. 4; Stewart, 'Hume and the "Metaphysical Argument"' (above, n. 50).

68 On this Society, see Ulman [11.54]. In spite of the occasionally acerbic rhetoric, several of his critics relished the challenges posed for them by Hume's philosophy. For a wider view of Aberdeen philosophical activity, see Wood [11.106]; Wood, 'Science and the Pursuit of Virtue in the Aberdeen Enlightenment', SPSE, 127–49. The Aberdeen philosophers constituted a loosely knit fraternity with varied interests. The herding of them into a

monolithic 'school' derives from later German and French commentary, but has its roots in Joseph Priestley's *Examination of Dr. Reid's Inquiry, etc*. of 1774. Priestley, an advocate of David Hartley's materialism, castigated Reid, Beattie and Oswald as a reaction-ary coterie, cut off from the mainstream. Of these, James Oswald (1703–93), whose interests were predominantly theological, repudiated any association with Kames.

69 George Campbell [11.21], 14–16, 22, 18.
70 Ibid., 26, 33.
71 Ibid., 45, 72–7.
72 A fuller discussion of common sense occurs in Campbell [11.22], I. v. 3, where it is one of three sources of Intuitive evidence' (evidentness). It is the basis upon which we recognize that whatever has a beginning has a cause, that where the parts of something serve a common end there was intelligence in the cause, and that there are other intelligent beings besides oneself. If we have not implicitly recognized these and other principles—the third is perhaps the most striking—we have nothing on which to base other knowledge.
73 Reid, *Intellectual Powers,* VI. vi (*Works* [11.62], 452–61).
74 Cf. Berkeley, *Principles,* §148.
75 P.B.Wood, 'Hume, Reid and the Science of the Mind', HHC, 119–30.
76 Beattie [11.10], 41, 142. Beattie left in manuscript a second, satirical, attack on scepticism. See King [11.107], ch. 5; E.C.Mossner, 'Beattie's "The Castle of Scepticism"', *Texas University Studies in English* 27 (1948): 108–45. For a reassessment of the relation of Reid and Beattie to Hume, see Somerville [11.108].
77 K.Haakonssen, 'From moral philosophy to political economy', PSE, 211–32.
78 Dugald Stewart [11.73], 1:441. For a searching critique of this reading of Hume, see Wright [11.123], ch. 4.
79 Stewart [11.73], 3:417–24. Cf. I.D.L.Clark, 'The Leslie Controversy', *Records of the Scottish Church History Society* 14 (1960–3): 179–97; J.G.Burke, 'Kirk and Causality in Edinburgh, 1805', *Isis* 61 (1970): 340–54; Carabelli [11.112], ch. 12.
80 Reid [11.62], 199.
81 Brown [11.12], 2nd edn (1806): 44–7, 51–5, 80, 94.
82 Another projected treatise on Berkeley has not been traced.
83 Shepherd [11.67], 33–4, 39–43, 28.
84 Shepherd [11.68], essay 8.
85 Ibid., ch. 2.
86 Reid, *Active Powers,* III. iii. 6 (*Works* [11.62], 590–1). A better picture of Reid's substantive ethics is to be obtained from his manuscripts. See *Practical Ethics* [11.63], including Haakonssen's substantial introduction.
87 Rowe [11.138].
88 Smith [11.71]; Ferguson [11.28]. Hume, principally in his *Essays* [11.44], also worked on topics in political economy. See A.S.Skinner, 'David Hume: Principles of Political Economy', in D.F.Norton (ed.), *Cambridge Companion to Hume,* Cambridge, Cambridge University Press, 1993, pp. 222–54.
89 Smith [11.72], I.i.1. For significant new scholarship on Smith the philosopher, see Skinner [11.146] and Jones [11.143],
90 Smith learnt from Hume the constructive role of the imagination in the workings of the mind For his application of this to scientific systems, see A. S.Skinner, 'Adam Smith: Science and the Role of the Imagination', in W.B. Todd (ed.), *Hume and the Enlightenment,* Edinburgh Edinburgh University Press, 1974, pp. 164–88; D.D.Raphael,' "The True Old Humean Philosophy" and its Influence on Adam Smith', in G.P.Morice (ed.), *David Hume.*

Bicentenary Papers, Edinburgh, Edinburgh University Press, 1977, pp. 23–38.

CHAPTER 12
The German Aufklärung and British philosophy

Manfred Kuehn

INTRODUCTION

The German Enlightenment was not an isolated phenomenon.[1] It was closely connected with developments in other European countries and in North America. Like the thinkers in other countries, the Germans were advocating a new ideal of knowledge. They were concerned with a critical examination of previously accepted doctrines and institutions from the point of view of reason. Though the German Enlightenment had its own distinctive voice, it would have been very different without influences from abroad. Two countries were especially important in shaping the German Enlightenment, namely France and Great Britain. It is perhaps not too much of an exaggeration to say that the German Enlightenment would have been impossible without these British influences. The following chapter will investigate the influence of British philosophers on the German Enlightenment.

It would be easy to enter into a dispute as to when the Enlightenment actually began. Some scholars have argued that the family of ideas and attitudes that characterize what we today call 'the Enlightenment' originated in the second half of the seventeenth century, others have argued that it was essentially an eighteenth-century phenomenon.[2] There are even good reasons for the claim that the 'enlightenment' as we understand it today really began to flower only at the middle of the eighteenth century.[3] However, it would be very easy to exaggerate the importance of such periodizations. There is no 'real chasm' between the Enlightenment and the period that preceded it. As Ernst Cassirer has pointed out, the new ideal of rationality developed 'steadily and consistently from the presuppositions which the logic and theory of knowledge of the seventeenth century… had established' ([12.19], 22). There is a change in emphasis, not a radical break. While such seventeenth-century philosophers as Descartes, Leibniz, and Spinoza were rather optimistic in believing that all knowledge could actually be reduced to rational principles and thus be raised to a strict science, the eighteenth-century Enlightenment thinkers were more sceptical about how this could be done. There is a move away from the principles to the phenomena, and from the general to the detail, but no abandonment of the goal of rational explanation. For this reason, we should expect difficulties in determining who did or did not 'belong' to the Enlightenment, but for the very same reason we must say that not much rides on such classifications.[4]

In any case, it is much easier to determine the beginning (and the end) of the Enlightenment in Germany than in most other countries. It clearly has its beginnings in the disputes between the followers of Christian Thomasius (1655–1728) and Christian Wolff (1679–1754) early in the eighteenth century at the University of Halle. The

pietistically influenced Thomasians strongly opposed Wolff's rationalistic philosophy on religious grounds and they ultimately were successful in having Wolff not only expelled from the University, but even from Prussia (in 1724). Wolff's formal address to the University of Halle "On the Practical Philosophy of the Chinese' of 1721 may be taken to be the culmination of this dispute, and it may also be taken as the starting-point for the discussion of the history of the Enlightenment in Germany. Wolff argued in this address that ethics was not dependent on revelation, that Chinese ethics and Christian ethics were not fundamentally different, that happiness need not have a religious basis, and that reason was sufficient.[5]

Wolffian philosophy became the dominant force at German universities after 1720. Its influence began to wane only after the middle of the century. However, when Wolff died in 1754, it was no longer at the centre of the philosophical discussion. From about 1755 on the Germans opened up more to external influences, and the Enlightenment in Germany began to resemble more closely the Enlightenment in France and Great Britain. This lasted until the early 1790ss. With the first successes and transformations of Kantian philosophy Germans turned inwards again. This change also marks the end of the German Enlightenment. Accordingly, it will be convenient to divide the German Enlightenment into two different periods, namely that of the early Enlightenment, or 'The Wolffian Period', which lasted from about 1720 to 1754, and that of the late Enlightenment or of 'popular philosophy', lasting from about 1755 to 1795.

THE EARLY ENLIGHTENMENT

The years between 1720 and 1754 are characterized mainly by the religious dispute between the Wolffians and Thomasians. While the Thomasians, deeply influenced by Pietism, advocated an almost mythical view of nature, the Wolffians were, on the whole, not religiously inclined and motivated by scientific concerns ([12.46]). Though both groups knew the major works of British philosophers, and especially those of John Locke, neither one had any deep affinities for them, and the influence of British philosophy on German thought during the Wolffian period was rather peripheral.

The Thomasians

Thomasius and his followers did not have much to offer by way of original thought addressed to philosophical problems.[6] They regarded most of the classical problems of perception and knowledge as sceptical quibbles of no consequence, believing that ultimately these problems could all be explained as the result of the Fall upon man's faculty of knowledge. Accordingly, they also believed that if the influence of the evil will were to be eliminated, everything would find its proper place and perspective. The Thomasian epistemology was therefore rather meagre. Its most distinctive characteristics are: (i) an extreme sensationalism, and (ii) a correspondence theory of truth, and (iii) the subordination of the faculty of knowledge to that of the will, and thus (iv) the subordination of philosophy to theology. Many of their psychological views exhibit a great resemblance to Locke's theories. And while Locke definitely had an influence on

their theories, these influences are not very interesting. In fact, everything that makes Locke philosophically interesting and important, namely his detailed investigations of particular epistemological problems and their consequences for metaphysics, is almost completely absent from the works of Thomasius and the Thomasians.[7] When they were not engaged in criticizing particular doctrines in Wolff, most of them excelled in general discussions of commonplaces.

Crusius, one of the last adherents of this way of thinking, is usually regarded as the most important of all the Thomasians. Following the earlier Thomasians, Crusius criticized rationalism from a pietistic point of view, objecting strongly to the optimistic faith in the omnipotence of reason. He argued that reason is limited and can be shown to be more dependent upon sense perception than the Wolffians wanted to admit. While he no longer accepted Thomasius's simple-minded sensationalist account of the origin of knowledge, and tended toward some sort of compromise between the rationalist belief in innate ideas and principles and Thomasian sensationalism, he is far from being clear on the details. Thus he did not want to reject entirely the doctrine of innate ideas, and he left the matter undecided. The following passage is perhaps typical:

> At the occasion of external sensation the ideas of certain objects arise. We then say that we sense these objects. There are two possible explanations for this. Either the ideas themselves already lie in the soul, and are made lively by these concurring conditions…or we have only the immediate cause and the power to form them at the moment of the concurrent condition and in accordance with it. We cannot know for certain which of these two possibilities is true. But we assume less, if we assume the latter.
>
> ([12.5], 153)

According to Crusius, rationalism was not necessarily wrong, though it may be presumptuous.

Crusius was at his strongest when he criticized Wolff and at his weakest when he tried to develop his own theory. Indeed, this can be said of all the Thomasians. Though they found in Locke a welcome ally in criticizing Wolff, they hardly ever went beyond him. Furthermore, their strong theological convictions usually got in the way of their philosophical arguments, making it very difficult for them to appreciate Locke's more subtle philosophical analysis. Accordingly, most of the similarities between the German sensationalists and British philosophers were incidental and remained without significant philosophical consequence.

The Wolffians

The Wolffians were philosophically more interesting.[8] However, since their philosophical project was essentially defined by the attempt to work out in a clearer and more systematic fashion the ideas of Leibniz, they had little use for such philosophers as Hobbes and Locke. Believing that the Leibnizian principles of contradiction, of sufficient reason, of the identity of indiscernibles, and of pre-established harmony were essentially correct, they also thought that philosophy was well on its way to becoming an exact

science by following the 'mathematical model'. The British philosophers, who emphasized the role of sensation in all of knowledge, appeared to be of little use in this context.

However, they were not dismissed. Wolff was clearly not a 'rationalist' in the sense of discounting empirical observation altogether. In fact, empirical observation formed for him the very starting-point, even 'foundation', for philosophy because he thought that by 'means of the senses we know things which are and occur in the material world'. Yet philosophy is not so much concerned with establishing and describing things as they exist, or as we may be acquainted with them by the senses. For Wolff, things 'which are or occur possess a reason from which it is understood why they are or occur', and philosophy is the enterprise of finding these reasons and putting them into systematic order by demonstrating how they are connected. Put differently, whatever exists or occurs is by that very fact possible. Philosophy's task is to show how they are possible. Accordingly, 'philosophy is the science of the possibles insofar as they are possible'. It must demonstrate from 'certain and immutable principles' and with 'complete certainty' why 'those things which can occur actually do occur' ([12.13] 3–20). Once this has been done, we have also demonstrated the 'reality' of the concepts of these objects, and we have gone from mere sensible and 'historical' knowledge to true philosophical understanding. In demonstrating why the things that can occur do occur, Wolff follows essentially Leibnizian lines, appealing to the principles of contradiction and sufficient reason. It is obvious that such philosophers as Locke could not be of much help in that enterprise. However, they could be important in determining what things exist or occur. Accordingly, one can find references to Locke in Wolff's discussion of 'empirical psychology'. He also appears to have made use of Locke in his moral philosophy. Some of his comments on Locke are negative, but many were much more positive than one might expect.[9]

Yet it would be easy to exaggerate the importance of Locke for Wolff. Though he could use some of the ideas of this British philosopher to his own end, he was ultimately more interested in developing his own metaphysics, i.e. in demonstrating the possibility of things and the reality of concepts. This was the part of his work that he considered to be most important. In fact, it was only this part that he considered to be truly philosophical. Locke entered really only into the pre-philosophical or 'historical' parts of his system. Even later, when such Wolffians as Baumgarten attempted to develop an aesthetic theory on Wolffian principles, this did not change. Aesthetics remained an attempt to show how beauty only appeared to be sensible, and that it was really also rational or conceptual. Accordingly, British philosophy could be for them, at best, marginally important.[10] It was only with Wolff's death and the end of the conflict between the Wolffians and the Thomasians that the Germans began to open up to British philosophers.[11]

THE LATE ENLIGHTENMENT AND POPULAR PHILOSOPHY

Moses Mendelssohn (1729–86), one of the best-known and most important philosophical talents of the second period, described the philosophical situation during the 1750s as one

of 'general anarchy', in which philosophy, 'the poor matron', who according to Shaftesbury had been

> banished from high society and put into the schools and colleges…had to leave even this dusty corner. Descartes expelled the scholastics, Wolff expelled Descartes, and the contempt for all philosophy finally also expelled Wolff; and it appears that Crusius will soon be the philosopher in fashion.[12]

This crisis was not a special German phenomenon, but one of European thought in general. In fact, it clearly was largely imported. While in Britain empiricism and rejection of ambitious all-inclusive speculative systems could already look back on a long and distinguished tradition, during the early part of the Enlightenment most German philosophers were still engaged in attempting to develop and work out such systems. In France, the mood had already changed under the British influence. Thus Condillac was asking in his *Treatise on Systems* (1749) for a synthesis of the positive or empiricist approach with a more systematic or rationalistic one, differentiating between the 'esprit systématique' and the 'esprit de système', rejecting the latter, while advocating the former. Voltaire had previously published his *Lettres philosophiques* (1743) and his *Elements de la philosophie de Newton* (1738), in which he attacked Cartesianism and argued for Newton's approach. Diderot, in his *On the Interpretation of Nature* (1754), advocated the experimental method and gave expression to his belief that mathematics had run its course and could not develop further. Rousseau's *Discourse on the Arts and Sciences* was published in 1750, and Buffon began to exert great influence when the first volume of his *Natural History* came out in 1749. Given the fact that most educated Germans could speak French and looked to France for literary and cultural models, it was inevitable that these developments would also have profound effects upon these Germans. Furthermore, since this empiricist turn in France was closely connected with a new appreciation of British natural science and British philosophy (indeed with an enthusiasm for anything British), the same also had to happen in Germany.

When Frederick the Great assumed power in 1740, he almost immediately began to work at reorganizing the Berlin Academy of Sciences. His intent was to raise its status, and to make it at the very least a worthy rival of the French Academy. To achieve this goal, he appointed to the Academy two of the leading Newtonians of the time, namely the French natural philosopher Pierre L.M. Maupertuis (1698–1759) and the gifted Swiss mathematician Leonhard Euler (1707–83). The perpetual secretary of the Academy, J.B.Merian, was also a Newtonian and therefore also anti-Wolffian. The King also invited promising Wolffians because he wanted a balance of Wolffians and Newtonians in the Academy.[13] However, between 1744 and 1759, it was clearly the Newtonians who had the upper hand. The questions for the regular prize essays were designed to discredit Leibniz-Wolffian philosophy, and to advance the course of Newton in Germany ([12.48]). This also involved close attention to British philosophy. The anti-Wolffians in the Academy knew and appreciated not only Locke, but also such thinkers as Berkeley and Hume ([12.50]) And Hume appears to have played an especially important role in the dispute between the Wolffians and the Newtonians at the Academy. Though it is not clear that the Newtonians always understood Hume correctly, they did invoke him against

Leibniz and Wolff.[14] Indeed, both the German and the French translations of Hume's *Essays* clearly were occasioned by the interest of the Newtonian members of the Academy.[15]

This clearly had important consequences. As one of the earliest historians of this period put it:

> Around the middle of the century…German scholars familiarized themselves more and more with other languages and especially with the beautiful and philosophical literatures of the French and the English. This…not only made them aware of the deficiencies and imperfections of the German language and the German national taste in the sciences and fine arts; and created not only the most lively passion to educate, to refine the sciences and the arts, and to compete with the foreigners in all kinds of beautiful representations, but it also made the Leibniz-Wolffian method of the school hitherto followed distasteful to the better talents. The strict systematic form, which the Wolffians had accepted, appeared to put oppressing chains upon the free flight of philosophical genius. Moreover, in a number of philosophical works by foreigners they also found thoroughness and systematic spirit, but no pedantry and coercion…even the textbooks of foreign philosophers were much more readable than those of the Germans.[16]

What looked at first like philosophical anarchy gave rise, under the influence of British models, to a new way of philosophizing. In the following I would like to say more about these effects.

Philosophical Style and Method

Hume's first *Enquiry* appeared in German as the second volume of the *Vermischte Schriften* in 1755. Johann Georg Sulzer (1720–79), the editor of the German translation of the first *Enquiry,* gave Hume high praise as a philosophical writer. He found that Hume could write clearly and elegantly about the most profound and difficult problems of metaphysics. Indeed, he claimed that in Hume 'thoroughness and pleasantness seem to fight for priority', and he praises Hume's work as the model for a truly popular philosophy, expressing his hope that the Germans would imitate Hume in this regard.[17] Closely connected with the problem of a popular philosophical style is for Sulzer—as well as most of his contemporaries—the problem of common sense. In fact, popular expression is seen only as the external expression of the principle of common sense ([12.14]). Therefore, Hume's philosophy could also be a model for philosophers who want to combine philosophical reasoning with common sense. However, one of Sulzer's most important reasons for publishing the translation was his belief that philosophers who are uncritically received become lax and superficial, and that the German philosophers are in this situation. They had allowed their weapons to become blunt and rusty 'during the long peace' of the Wolffian period.[18] Hume could be useful as a critic of German philosophers. Sulzer hoped that 'the publication of this work will interrupt their leisurely slumber and give them a new occupation'.[19]

Mendelssohn

One of the philosophers who was most impressed by Hume's style was Mendelssohn. In fact, he openly emulated it in his own works. Thus in his anonymous 'Letter of a Young Scholar in B'. he spoke of

> the beautiful philosophical writers, those who have noticed that the systematic way of representation is not always the best, those like Leibniz, Shaftesbury, Hume or the author of the *Letters on Sensation,* who often digress, but who always get back to the point.[20]

According to most Germans of the period, Mendelssohn succeeded admirably. They praised the elegance and thoroughness of his writings—comparing them explicitly with those of Hume. This shows that Hume provided these Germans with a new model for writing philosophy.

Garve

However, it would be a mistake if it were thought that this was a *merely* stylistic manner. We can see this clearly in another philosopher, who found Hume important for his style of writing, namely in Christian Garve (1742–98). Differentiating between a number of methods of thinking, he called special attention to what he called the method of observation.[21]

> It starts neither from the most general principles nor from common experiences; it is neither a systematic deduction of the appearances from rational concepts, nor a Socratic ascent from facts to the ideas and principles of reason. The philosopher… leads his readers…right into the materials, allowing necessary and preparatory ideas to flow in at certain occasions.

The philosopher who follows this method does not represent himself as a teacher among students. Rather, he presupposes that his readers know what any well-educated person knows about the subject, 'and his only goal is to add to the common stock of knowledge some new discoveries from his experience, and to fill in, or even discover some gaps'. According to Garve it is natural that 'all such new ideas…are only fragments'. He thought that the essays of David Hume were full of such fragmentary ideas. Furthermore, Garve argued that the value of these fragments was enhanced by Hume's sceptical approach. As a sceptic, Hume evaluates both reasons for and against any view under consideration. Since this is done in a masterful fashion by Hume, both in his *History* and in his philosophical writings, Hume could serve as the model for a new way of philosophizing. While his philosophy may have a bad name for some 'ever since its aim has been identified as empirical', it need not be contradictory to systematic philosophy. Indeed, such a philosophy of observation can itself be systematic, and 'an investigation that consists only of observations can possess true philosophical thoroughness as Hume's

and Montesquieu's works which are written in this spirit prove'. Hume's cautious and methodological scepticism became an alternative to the dogmatic way of doing philosophy, and many Germans followed Hume without ever openly referring to him.

Feder and Meiners

Similar methodological considerations also motivated the Göttingen philosophers Johann Georg Heinrich Feder (1740–1821) and Christian Meiners (1747–1810). Though both opposed radical scepticism, they also considered themselves as moderate sceptics. In fact, Feder described himself as having 'wavered between Wolffian dogmatism and scepticism' early in his life, and he further characterized his early scepticism as having been 'unrefined', 'unchecked' and 'without system'. His later thought consists exactly of a refined or checked scepticism, or a scepticism with a system. The same may also be said of Meiners. His *Revision der Philosophie* of 1772 relied mostly on the 'wise Locke' and the 'brave and good-natured Hume'. He also found that for strict or 'esoteric' philosophy 'no other method is as favourable as the sceptical method'. This scepticism towards all philosophical theories brought Feder and Meiners into the proximity of such common-sense philosophers as Thomas Reid. Like Reid, they felt that philosophers aimed too high in their conception of philosophy, attempted to obtain knowledge out of reach for human beings, and believed that 'whatever else man may try, he can only think with *his own* understanding' and not with some superhuman faculty of thought which grants absolute certain knowledge. Our understanding is very limited and not the best we can imagine, but it is all we have: 'to despise it for this reason, or not to be satisfied with it…would be neither philosophy nor wisdom'. According to Göttingers, philosophy had to become more modest. It had to learn from common sense, which is stronger than philosophical speculation. Indeed, the circumstance that common sense and the principles of morals, upon which human happiness depends most, have been conserved in spite of all the many artificial webs of error shows the beneficial frame of nature, which does not allow us to drift too far from these wholesome truths in the course of exaggerated speculation. Obscure feelings indicate them for us and instinct leads us always back to them. Accordingly, for the Göttingers the real task of philosophy could only be to establish these principles of common sense and morality more clearly and to defend them against the exaggerated speculations of certain philosophers.

However, their works had a tendency to become what Kant called a mere 'critique of books and systems'. Rather than concentrating on analyzing philosophical problems and solving them on their own, they collected all the different theories others had advanced with regard to them. While their philosophical approach is therefore usually characterized as 'eclecticism' or 'syncretism', it is perhaps better to call it 'indifferentism' or 'methodical scepticism', for the Göttingers did not set out simply to give a collection of different philosophical opinions, but they tried to develop a consistent philosophical system. Their study of different philosophical theories was no end in itself, but a methodological tool. As Feder put it, for instance: 'In order to protect myself from the delusions of one-sided representations and to reach well-founded insights it is necessary to compare different ways of representation and to study several systems'.

This approach to philosophy became very influential during the latter half of the

eighteenth century. Indeed, most popular philosophers followed this approach.[22] At least partially as a result of this tendency to mere eclecticism, most did not succeed in making interesting contributions to the discussion of philosophical problems, and their works deteriorated into a mere listing of different philosophical opinions.

New Problems in Metaphysics and Ethics

The increased attention to the observations and problems raised by British philosophers also had definite influence on what these Germans viewed to be the philosophical problems that needed to be solved. The early Wolffians had been occupied mainly with the rational side of man, or with logic and metaphysics, and they had neglected almost completely our sensitive side (or, like Baumgarten, simply treated it 'in analogy to reason'). The works of the British philosophers brought the importance of man's sensitive nature most forcefully home to them. Accordingly, the younger German philosophers tried to supplement the Wolffian theory by relying on British observations, or they simply rejected Wolffianism altogether. Psychology and anthropology, aesthetic and educational theories based upon more empirical methods began to replace logic and rationalistic metaphysics as the key disciplines for an understanding of the world and man's place in it. The discipline of metaphysics itself was transformed by this. While the Wolffians had already differentiated between an 'empirical' and a 'rational' or 'pure' discipline within metaphysics, they had also clearly emphasized the work of pure metaphysics as the most distinctive and fundamental occupation of philosophy. During the second part of the German Enlightenment, the empirical part became more and more decisive. Yet only few were willing to give up pure metaphysics altogether. In their heart of hearts, most of these philosophers remained Wolffian.

Mendelssohn

One of the philosophers who most resisted the move in this direction, while at the same time paying a great deal of attention to incorporating British observations into aesthetics and ethics was Mendelssohn.[23] Brought up on Wolffian logic and ontology, *rational* theology and *philosophia practica universalis,* he had early discovered that this way of philosophizing was exhaustive neither of the world nor even philosophical discussion. He found that British philosophers also had something to offer. The works of Locke, Shaftesbury, Hutcheson, Hume, and almost every other British philosopher of note were full of problems that needed solution and observations that needed to be explained, if German philosophy of the traditional sort was to succeed, and most of these problems seemed to have do with the analysis of sensation in theoretical, moral, and aesthetic contexts. Mendelssohn had formulated a new problem or task for himself (and the other Germans). This task was conceived by him—at least at first—as one of incorporating British 'observations' in a comprehensive theory. As he noted at the occasion of a review of Edmund Burke's *A Philosophical Enquiry into the Origin of our Ideas of the Sublime and Beautiful:*

> The theory of human sensations and passions has in more recent times made the

> greatest progress, since the other parts of philosophy no longer seem to advance very much. Our neighbours, and especially the English, precede us with philosophical observations of nature, and we follow them with our rational inferences; and if it were to go on like this, namely that our neighbours observe and we explain, we may hope that we will achieve in time a complete theory of sensation.[24]

What was needed, he thought, was a *Universal Theory of Thinking and Sensation,* and such a theory would explain the relation of sensation and thinking in theoretical, moral and aesthetic contexts.[25] It would use British 'observations' and German (speak: Wolffian) 'explanations'.

Mendelssohn had also definite ideas about the general approach that had to be followed. It had to be shown that the phenomena observed by British philosophers and traced by them to a special sense are really rational. Thus it was wrong, he argued, to follow certain British philosophers in speaking of a special 'moral sense' or 'common sense', for instance. Though they may appear to be independent faculties of the mind, they must be reduced to reason. Though he admitted that this reduction to reason is difficult in the case of moral judgements, since our moral judgements 'as they present themselves in the soul are completely different from the effects of distinct rational principles', he did not think that this means they could not be analysed into rational and distinct principles.[26] Our moral sentiments are 'phenomena which are related to rational principles in the same way as the colours are related to the angles of refraction of light. Apparently they are of completely different nature, yet they are basically one and the same'.[27] Moral phenomena are phenomena in the Leibnizian sense, but they are also *'phenomena bene fundata'* because they are ultimately founded in something rational. In this way Mendelssohn also set for himself and others a most important task, namely the task of explaining how the rational principles are related to what appear to be the completely different moral sentiments, for the colour analogy, though very sugges-tive, does not explain anything about the actual relation between rational principles and moral judgements. It was precisely this task that defined one of the central concerns of German metaphysicians and moral philosophers during the second half of the eighteenth century, namely to show how 'sense' could be reduced to 'rational principles', or how British observations could be incorporated into a framework that remained more or less Wolffian. Most philosophers in Germany between 1755 and 1790 were working on this problem in some way or other. In the following I shall briefly summarize two of the most important and influential attempts, namely those of Johann Nicolaus Tetens and Immanuel Kant.

Tetens

Johann Nicolaus Tetens may well be the German philosopher of this period who learned most from British thinkers. He is sometimes referred to as the 'German Locke', but he might also have been called the 'German Reid', for Tetens always starts his own discussion of philosophical issues at the point where Reid left off, and his epistemological theory is deeply influenced by the Scottish analysis of the problem of perception. Dissatisfied with the state of German speculative philosophy as he found it, Tetens turned

to observational psychology for his method and to common sense for the subject-matter of his philosophy. Thus he declared that the method he has used 'is the method of observation; the one which Locke and our psychologists have employed in their empirical psychology', and that 'the cognitions of common sense are the field which must be worked in philosophy'. Yet even Tetens did not believe that Locke's method could exhaust all of philosophy. Rather, he believed that even if we were to succeed in determining and describing all the principles of the human mind 'in accordance with the analytic method, used by Locke, Hume, Condillac, and others (including some German philosophers)', there would still be much more work to be done; we would have to go on to develop a basic science that has to do with the 'universal reason' of things. Though Tetens spent most of his efforts pushing further along the lines of Locke, Hume, Reid and Condillac, he argued that speculative philosophy is not only possible, but even desirable. Ultimately, his work was meant to show that, once the human mind had been correctly described, and its fundamental concepts and principles had been catalogued, metaphysics could be freed from the contradictions which make up such a large part of it. Metaphysics would then be able to progress without further difficulties. In fact, Tetens believed that a metaphysics is possible even without a complete delineation of the basic features of the human mind. That this is possible is shown by the fact that there 'exist already, at present, many particular speculative theories from general concepts, which our metaphysicians have developed, and which secure for the understanding that knows how to use them great, extensive and fertile vistas just as they are'. We need only to develop further these fragments of metaphysics that exist in order to arrive at the truths that define the fundamental science of metaphysics.

These truths will, according to Tetens, be objective truths, not merely subjective convictions. Since Locke's analytic method can yield at best 'subjective necessity which forces us to think in accordance with universal laws of the understanding', he must show how objective necessity arises, or how it is that we can legitimately ascribe 'what we cannot think otherwise' to properties in the objects themselves. Tetens tries to accomplish this by first showing that this question can only mean 'whether the laws of thought are only subjective laws of our own faculty of thought or whether they are laws of any faculty of thought whatsoever'. After these reformulations, Teten's answer to the question concerning the objectivity of knowledge has become surprisingly simple. Since we cannot think any other faculty of thought than our own—for if there were such a faculty of thought with other laws, it could not be called 'thought' in the same way as our faculty—the truths of reason 'are objective truths, and the fact that they are objective truths is just as certain as the fact that they are truths in the first place. We cannot doubt or deny the former, just as we cannot doubt or deny the latter'.

Kant and the end of the Enlightenment

It was in this philosophical situation that Kant first conceived of the problem of a critical philosophy and began to work towards his *Critique of Pure Reason*. His own work owes just as much to such philosophers as Locke, Hume, Reid, Hutcheson and Smith as it does to the earlier German discussions of their theories. Indeed, Kant's ultimate theory is in one important sense no different from the reactions of his German contemporaries. He is

also concerned with developing a universal theory of thought and sensation. He also wanted to show that the mere subjective necessity of sense that appeared to be sufficient for British philosophers to speak of certainty, can be shown to be objective. Furthermore, he also followed the lead of the other Germans in trying to show that sense-perception presupposes concepts. Though his account of how the senses presuppose concepts is different from those given by his contemporaries, it owes a great deal to them, and it alone does not radically differentiate his position from theirs. His a priori 'categories and principles of understanding' are closer relations of Tetens's 'laws of the understanding'.[28] However, what differentiates him from his contemporaries is that he was willing to take a step they apparently could not make, namely to accept as true Hume's principle of significance, or the claim that we cannot possibly know anything that goes beyond what can be experienced through our senses. Sensations without concepts may be blind, but concepts without sensations are empty. Kant argued that metaphysics in the traditional sense was a dead end and an illusion, while they were all trying to revise or repair it so that it could take into account sense-perception in a better way than traditional Wolffian metaphysics had allowed it.

One might say that Kant finished the task that Mendelssohn had earlier formulated. The (British) observations had been incorporated into a (German) theory. His *Critique of Pure Reason* is, at least by intention, the kind of *Universal Theory of Thought and Sensation* that Mendelssohn was asking for and that most of the Germans of the period were trying to develop. But when the *Critique* appeared it was not seen as the solution of that problem, but rather as a problem itself. Indeed, it was seen to give rise to a great number of problems. During the 1790s, Germans began to concentrate more and more on the problems posed by Kant. Though British philosophers were still mentioned, their views were hardly ever discussed. In this context we find such oddities as a review of a German translation of Hume's *Treatise* that neither says anything about the contents of the work nor about the quality of the translation, but offers just a discussion of Kant's deduction of causality as an a priori principle.[29] British philosophy had become irrelevant for the problems the Germans were discussing now. This turn-away from British sources coincided with the end of the Enlightenment in Germany.

NOTES

1 This chapter should be compared with the fuller treatment of the Enlightenment given by Lewis White Beck in [12.17].

2 Hazard [12.27], suggests such an early beginning. See also [12.28], xvi. Beck, [12.16], 243, suggests '1687–1688, the publication of Newton's *Principia* and the Glorious Revolution' as a convenient date for its beginning and '1790–1793, the publication of Kant's last *Critique* and the Reign of Terror' as the date for its end. I shall follow Beck's suggestion.

3 This is suggested by Cassirer in [12.19].

4 See also [12.21].

5 I agree with Beck that both Thomasius and Wolff are important for the German Enlightenment. However, I am not sure that it is quite correct to refer to the two as the 'two founders of the German Enlightenment', and that besides the rationalistic form of the Enlightenment of Wolff, there was also a Pietistic version of it. (See [12.16], 243ff.) I am

dubious as to whether Thomasius and his followers really should be viewed as belonging to the 'Enlightenment' per se. In many ways they are better characterized as belonging to the enemies of the Enlightenment. It is not insignificant that Wolff gave this address when he had to leave Halle because of pressure from the Thomasians.

6 The most important members of this school are Christian Thomasius, Johann Franciscus Budde (1667–1729), Joachim Lange (1670–1744), Andreas Rüdiger (1673–1731), and very remotely A.F.Hoffmann (1703–41) and Christian August Crusius (1715–75). Johann Jakob Brucker (1696–1770) also deserves to be mentioned. His influential *Historia critica philosophiae* is said to have been the source of Diderot's articles on the history of philosophy in the *Encyclopédie*. See [12.26], 1:346–8.

7 For details (and a more positive account) see [12.45], 33–72.

8 The names of the Wolffians are legion. They are too numerous to mention, since they held positions at almost every institution of higher learning in Germany. Some of the most important are Ludwig Wilhelm Thümmig (1697–1728), Bernhard Bilfinger (1693–1750), Friedrich Christian Baumeister (1709–85), Gottsched (1700–66), Georg Friedrich Meier (1718–77), and especially Alexander Gottlieb Baumgarten (1714–62).

9 Wolff clearly also knew of Berkeley and Collier, and he found it necessary to offer a refutation of idealism that is meant to refute them along Leibnizian lines. It is not clear how well he knew Berkeley.

10 Nationalist historians of philosophy have attempted to show that the Germans never took British philosophy seriously, and that the entire eighteenth century can be explained by German sources alone. Dessoir, for example, tried to show in [12.22], 53, that 'the basic direction of this development [of German thought in the eighteenth century] can be understood even without referring to England' by relating Kant to the later Thomasians and especially Crusius. And Max Wundt argued that Kant's critical problem arose 'from a connection of the subjective and psychological approach of Thomasius with the objective and ontological principles of Wolff, claiming that Kant's 'transcendental logic must be derived from this tension within German philosophy and not from foreign influences' ([12.43], 250 and 254).

11 The following can trace only the rough outline of the German-British relation. It would take several monographs to do it justice. Above all, Shaftesbury, Hutcheson, Lord Kames, Hume, and Reid and Ferguson were found to be extremely important by the Germans. For Shaftesbury, see [12.41]. For Henry Home, Lord of Kames, see [12.42], [12.32] and [12.65]. For a general account of the state of discussion concerning Home's influence in Germany see [12.37]. On Ferguson not very much work has been done. But see [12.24]. See also Pascal [12.65]. For Reid see [12.30] or [12.31] and for Hume see [12.29].

12 Mendelssohn, *Briefe, die neueste Literatur betreffend* 1(1 March 1759): 129–34.

13 See [12.51]. See also [12.49].

14 See, for instance, [12.8]. See also [12.9]. Both are discussed in [12.53], 70ff-Merian's interest in Hume did not decline. Thus on 16 December 1763 Mr. Merian read 'une Piece traduite de Hume "Sur l'Eloquence"' ([12.52], 282). For the 1790s see [12.10].

15 Thus the translator of [12.15] with the first *Enquiry* as volume I, was the perpetual secretary of the Berlin Academy, J.B.Merian. The writer of the Preface was another prominent member of this institution namely J.H.S. Formey, and the entire enterprise is said to go back to a suggestion by Maupertuis, the president of the Berlin Academy. Johann Georg Sulzer, a prominent Wolffian in the Academy thought that Hume was important for precisely the same reasons that Maupertuis, Merian and Formey believed him to be important. He also believed that Hume's scepticism constituted a most significant objection to Leibnizian philosophy,

and it was for that reason he thought that the *refutation* of Hume was most important. Thus he became the editor of the German translation of the first *Enquiry,* and took the occasion to provide this dangerous work with an introduction and a running commentary, designed to refute Hume's theories.

16 See [12.4], 4:503f., see also [12.4], 5: i-x, and [12.6], 1:289.

17 [12.14], Vorrede. That Sulzer is not the translator is clear from the following: 'Es haben mich zwei Gründe zu der Bekanntmachung dieser Übersetzung bewogen, die ich durch einen blossen Zufall in die Hände bekommen habe'.

18 Sulzer obviously did not think that the criticisms put forward by the Thomasians were serious objections to Wolff.

19 Kant later in the *Prolegomena* seems to allude to just this passage when he says that he was awakened by Hume from his Dogmatic slumber', and that this gave his enquiries a 'new direction'. See also [12.72] and [12.74].

20 [12.2], 524f. Since Mendelssohn himself was the author of the *Letters on Sensation,* he explicitly identifies himself as a Humean in so far as writing is concerned. He goes on to wonder whether Shaftesbury and Hume followed 'a single line of inferences', but he declines to answer the question because this exegetical question can only be answered by a closer study of the actual texts. Shaftesbury was also important. The *Philosophische Gespräche,* for instance, are patterned after a dialogue of Shaftesbury (see [12.53], if. and [12.54], 37ff). His 'Briefe über die Empfindungen' are even more indebted to Shaftesbury's style ([12.53], 86–90). Mendelssohn also began a translation of Shaftesbury's essay on the *sensus communis* because he liked that work so much. What he seems to have appreciated the most was Shaftesbury's suggestion that ridicule could serve as a test of truth ([12.54], 109–12). Hume's *Enquiries* also played a large (though mainly negative) role in Mendelssohn's thought. In fact, his essay 'Über die Wahrscheinlichkeit' is, at least in part, an attempt to answer Hume's doubts about experiential judgements and their basis in analogy and induction (see [12.16], 321n. and [12.53], 233).

21 Actually, he differentiates six methods. 'The first is the method of education or the systematic method, the second, the method of invention or the Socratic method, the third the historical, the fourth the method of refutation, the fifth the method of commentary, and the sixth that of observation.' As the best example of the systematic method he mentioned Descartes. It is the method of those who already know what they want, and who want to get to their goal as efficiently as possible. The second method was for him that of the inventors of ideas. He mentioned Franklin and Plato as examples. The third, fourth, fifth and sixth methods are really only subgroups of the second. The third is really the methods of genetic explanation. It is either that of an individual of a species and either true or fictional. The method of refutation might be thought to be the one he assigns to Hume, but he doesn't. It is for him really a German method. Leibniz and Kant are characterized by it. As he puts it:

> Leibniz, whose name honours that of Germany found his way to most of his truths by refuting or correcting the concepts of Locke and Descartes. And even that philosophy by which our age will distinguish itself for posterity and which begins to communicate its form, though not always its spirit to German writings in all different kinds really is the fruit which developed from the germ of an examination and refutation of the skeptical claims of Hume and the dogmatic assertions of Leibniz.

22 The most important philosophers in this group are Dietrich Tiedemann (1748–1803), Christian Lossius (1743–1813), and Ernst Platner (1744–1818). Their theories are in many

ways not much more than the stricter application of the principles of Feder and Meiners. In fact, some of them, like Tiedemann, for instance, actually studied in Göttingen. Others, like Platner, Irwing and Lossius, were more independent. But in general, it may be said that while the Göttingers were content with a careful consideration of various theories and often suspended final judgement, the sensationalists had a strong bias towards physiological explanations. They were convinced that sensation and its basis in human physiology was the key for understanding human nature and thus for putting philosophy on a scientific basis. They all rejected Wolffian rationalism as being fundamentally mistaken and leading to a form of idealism. But they were by no means radical materialists. For they denied neither the existence and immortality of the soul nor the existence of God. Though they tended even further towards empiricism and sensationism than either the Berliners or the Göttingers, their general aim may still be described as the attempt to achieve a synthesis of British and German thought. And no matter how far they go in the direction of empiricism, they still remain deeply influenced by Wolffianism.

23 Mendelssohn is sometimes grouped together with other thinkers as belonging to the 'Berlin Enlightenment'. This group includes such names as Gotthold Ephraim Lessing and Mendelssohn. But there are also such lesser known figures as Sulzer (1720–79), Johann August Eberhard (1739–1809), Johann Heinrich Lambert (1728–77), Thomas Abbt (1738–66), Freidrich Gabriel Resewitz (1728–1806), and a number of even more minor thinkers. Because they all remained to a significant degree Wolffians they have also been called 'neo-Wolffians' by some historians.

24 *Bibliotbek der schönen Wissenschaften und der freyen Künste* II, 2 (1759), I quote from the 2nd edn of 1762, pp. 290f.

25 This is the title of a book by Eberhard (Berlin, 1776). The book was a response to a question by the Prussian Academy, asking for a more precise theory of thinking and sensation. Eberhard reports that the question specifically demanded that '(i) one precisely develop the original conditions of this twofold power of the soul as well as its general laws; thoroughly investigate how these two powers of the soul are dependent on each other, and how they influence each other, and (iii) indicate the principles according to which we can judge how far the intellectual ability (genius) and the moral character of man depends upon the degree of the force and liveliness as well as on the increase of those two mental faculties', (p. 14f).

26 [12.3], 2:183.

27 [12.3], 2:184.

28 Compare [12.17].

29 [12.7], 4 (1791): 155–69. Feder's only reference to the work reads: 'The many merits of this work have without doubt already been decided for most readers. Therefore I do not think it necessary to say anything about it'.

BIBLIOGRAPHY

(This should not be viewed as a complete bibliography of the subject, but only as a supplemented bibliography of 'works cited'. For more comprehensive bibliographies see especially [12.17], [12.29], [12.30], [12.35], [12.36], and [12.40].)

CHAPTER 13
Giambattista Vico

Antonio Pérez-Ramos

Faire, c'est se faire.
S.Mallarmé

Giambattista Vico's (1688–1744) contribution to the history of western thought is both difficult to identify and still harder to evaluate. So much so that the overall characterization of his philosophy should perhaps be made chiefly by way of negatives: Vico is no empiricist, no experimentalist, no scholastic, no idealist, no positivist, no rationalist and so on. In fact, any philosophical classification would be a misnomer for the purported creator of a New Science, the self-appointed critic of Cartesianism, the passionate vindicator of a 'topical' versus a 'critical' pedagogy, the putative discoverer of a novel criterion of truth etc. This historiographic problem—i.e. the difficulty of classifying such a many-sided figure into a well-established canon—becomes further compounded by at least three complementary considerations: Vico's purported isolation as an eighteenth-century thinker, the not yet corrected imbalance between his reputation in Italy (where he tends to be considered the country's greatest philosopher) and his reputation abroad; and, more generally, the fact of his being perceived as a precursor, which conjures up the whole panoply of unresolved tensions related to that status. Vico himself made much of the first of these factors in his *Autobiography* of 1725–8 and in his private letters, where he grossly exaggerated his loneliness as a thinker in his native Naples; and since that time many critics and scholars have repeated the implied corollary of that book, i.e. the picture of a gigantic figure without direct forerunners or disciples. Thus, nationalistic motivations and the fervour of Neapolitan exiles in the early nineteenth-century began to cement a cult which elevated Vico to the pedestal of a cultural hero in the age of the Risorgimento—a situation which with all due modifications still prevails today.[1] And, finally, the status of a precursor is particularly difficult to assess in this instance, for it sends us back to a much discussed question in the history of ideas and of philosophy proper. Such a question could be formulated in this manner: are influences the result of direct acquaintance whenever we are talking of intellectual affinities, or is there a collective wealth of patterns of thought which the human mind is compelled to resort to whenever confronted with the same or similar type of issue? Vico, for example, has been lyrically hailed as, among other titles of glory, containing the nineteenth century in embryo,[2] of fathering or at least prefiguring the whole of German idealism,[3] and of being the fountain-head of modern anthropology and psycho-analysis.[4] Though most of these claims appear today vastly exaggerated if taken at face value, there is a sense in which the radically atypical traits in Vico's thought are linked to further developments in western speculation, with or without direct acquaintance from author to author. It is for this reason that any historiography worth its

salt should try to asses such purported affinities, or, at least, to outline the tantalizing contours of similarities and incompatibilities.

Vico's starting-point as a philosopher is his criticism of Cartesianism, both as a philosophy and as a philosophically-inspired pedagogy. From the early inaugural orations that Vico had to deliver in his capacity as Professor of Rhetoric at the University of Naples, he emphasized time and again the putative sterilizing result of applying the analytical method of thinking (as epitomized by the Cartesians Arnauld and Nicole in their *Port Royal Logic*) against the old *ars topics* that is, the ancient canon of specific questions and answers that the prospective learner had to ask about any subject whatsoever in order to attain a plausible (though not necessarily true) opinion in the matter in question.[5] This debate ('topical' versus 'critical' philosophy) has led some students to see Vico as a fundamentally old-fashioned figure, propounding a superseded method of thinking in the tradition of rhetoric instead of embracing the novelty of contemporary doctrines in natural philosophy. As it stands, this criticism is unfair, for a reading of Vico's inaugural lessons prefigures his great discovery, i.e. the *verum factum* formula in *De Antiquissima Italorum Sapientia* of 1710, as a key to an understanding of contemporary physical science. So we can read in the oration *De Nostri Temporis Studiorum Ratione* of 1708:

> Modern physicists resemble those who have inherited mansions where no luxury is lacking, so that they only need to move around the many pieces of furniture or embellish the house with some ornaments in accordance with the tastes of their time; and these learned men hold that the physical doctrines are Nature herself… That is why every thing that on the strength of the geometrical method is shown in physics as being true is only probable /ista physicae quae vi geometricae methodi ostenduntur verae, nonnisi verisimilia sunt/ and from geometry has got the method, but not the demonstration. We demonstrate geometrical entities because we make them; if we could demonstrate physical truths, then we would be their authors/ geometrica demonstramus qua fecimus; si physica demonstrare possemus, faceremus/.[6]

Now there are three main components in these compressed lines of the young Vico, lines belonging to a chapter tellingly entitled 'Of the Disadvantages of Introducing the Geometrical Method into Physics'. The first factor we should consider pertains to what in our idiolect is termed 'the philosophy of science'. Vico's radical and at the same time original position amounts to this: he is expressly rejecting the realist understanding of the 'mechanization of the word-picture' (roughly: of Newtonian mechanics) as the true and objective portrait of the physical world. Further yet, this rejection is made extensive to any physical system whatsoever. Instead, Vico proposes to consider the so-called mechanical philosophy as a useful or expedient fiction, whose certainty is solely based on the method deployed (i.e. mathematics), but falls short of the supposed objectification of reality which a widespread realist self-understanding of modern science would claim for itself.[7] Naturally, this approach may strike a conventionalist or fictionalist chord, and resembles Locke's paradoxical dictum in the *Essay* iv. 12.10: 'Natural philosophy is not capable of being made a science'. But Vico's philosophical acumen in reaching that

conclusion is all the more remarkable coming as it does from the rhetorical tradition and being, by and large, alien to the great philosophical debate that the new science had unleashed. The second point to stress in the above passage concerns Vico's view of pure mathematics as precisely the only *true* science conferred on man, because in it author and knower coincide: the mathematician, Vico holds, knows his truths by making, doing or bringing forth the elements with which or upon which he works. This is the first embryo of Vico's celebrated *verum ipsum factum* principle as a criterion for gauging human knowledge, and the cornerstone of his own constructivist theory, to which I shall shortly return. And, finally, the above passage characterizes Vico's own response to the *crise pyrrhonienne* or sceptical challenge, the reaction to which, according to Pierre Bayle, serves to document the rise of modern philosophy and science.[8] Vico's answer to that challenge, moreover, establishes a certain hierarchy in the forms of human knowledge which he is going to develop and modify in his mature work. Let us consider Vico's response to scepticism with some more detail.

Mathematical knowledge, we said, is provenly certain *(verum)* because it is produced, realized, constructed or made *(factum)* by the knowing subject himself: 'We demonstrate geometrical entities because we make them'. Now if mathematics thus typifies human cognition at his best, would it not be the case that it does so because it is precisely embodying the only criterion of truth that man can follow? Here begins Vico's systematic critique of the other great foundationalist movement of the age, namely, Cartesianism, a critique to which he partially devoted the so-called *liber metaphysicus* of 1710, i.e. the *De Antiqmssima Italorum Sapientia*.[9] In this book Vico's quasi-fictionalist or conventionalist understanding of physical science is expressly coupled with a full-fledged constructivist theory of truth whose further implications for the classification of the sciences are clearly delineated. In so doing, however, Vico considerably draws on the Aristotelian doctrine that to know means to know *per causas* as a way of exposing the putative fallacy and incoherence of the Cartesian cogito. Thus, he programmatically asserts that 'science is the knowledge of the genus or the mode by which a thing is made /scientia sit cognitio generis seu modi, quo res fiat/…by means of which the mind, at the same time that it knows the mode because it arranges the elements, makes the thing /dum mens cogitat, rem faciat/'; and consequently: 'Human truths are those of which we ourselves arrange the elements'.[10] So the first adumbration of Vico's great epistemic canon in *De Nostri Temporis Studiorum Ratione* reaches maturity and becomes fully developed in his criticism of Cartesian metaphysics: the true and the made are convertible, and the ego which the cogito is supposed to discover or establish as the firmest truth is not that piece of rock-bottom knowledge from which other verities can be inferred in a deductive chain. According to Vico, the notionally unchallengeable ego has no causal underpinnings whatsoever, that is to say, it is not constructed or fabricated, made by the thinking mind. In fine, the Cartesian cogito 'I think, therefore I am' is therefore a form of *coscienza* (or very vivid mental content, as a Humean 'impression'), but it can never attain to the status of *scienza* or proven knowledge as constructed by the inquiring subject. Again, the anti-sceptical tenor (even as Descartes emphasized in the case of his own cogitation) of Vico's purported discovery is expressly stressed:

> To be sure, there is no other way in which scepticism can indeed be refuted,

> except that the criterion of the true should be to have made the thing itself.… Those truths are human truths, the elements of which we shape /fingamus/ for ourselves, which we contain within ourselves, and which we project ad infinitum (to infinity) through postulates; and, when we combine them, we make the truths that, by thus combining them, we come to know. And because of all this we get hold of the genus and form by which we make these things.[11]

At this point Vico also invokes a theological sanction for this criterion, given that 'Divine Knowledge is the norm of human knowledge' (ibid.). The starting-point of his reflection here, however, seems to be an awkward philological doctrine, namely, the putative synonymity of the words *verum* and *factum* in classical Latin. Indeed, Vico's opening gambit in chapter I of the *De Antiquissima* runs:

> For the Latins *verum* /the true/ and *factum* /what is made/ are interchangeable, or to use the customary language of the Schools, they are convertible /Latinis verum et factum reciprocantur, seu, ut Scholarum vulgus loquitur, convertuntur/ … Hence it is reasonable to believe that the ancient sages of Italy entertained the following belief about the true: 'The true is precisely what is made' /verum ipsum factum/.[12]

Vico's resort to the Latin language in order to bolster up his gnoseological position was soon criticized on linguistic grounds in the review of his book which appeared in the learned publication *Giornale de' Letterati d'Italia*. In his *First Response* to those criticisms, Vico tried to defend his philological thesis by quoting Plautus and Terence, but in his *Second Response* (following a rejoinder in the journal) he wisely retreated from the terrain of pure lexicography and explained that

> etymologies which the grammarians draw largely from the Greek language of the inhabitants of the Ionian coast serve me only as evidence that the ancient Etruscan language was diffused among all the peoples of Italy, as well as in Magna Graecia. *They have no other use for me.* I have tried to figure out the reasons that the concepts of these wise men became obscure and were lost to sight as their learned speech /i loro dotti parlari/ became current and was employed by the vulgar.[13]

So the *verum factum* criterion, stripped of its philological clothing, is now presented as possessing the character of an absolute and self-evident truth—the touchstone of *any* conceivable human truth. To make this position even clearer, Vico condenses much of his constructivist ideal under a theological cloak which recaptures most of the topics we have been considering, that is, the nature of mathematics, the criticism of Descartes's claim about the self-certainty of clear and distinct ideas, the *verum factum* topos as exemplified not only in mathematics qua constructs but in any facet of human cognition, and finally his own hierarchy of knowledge. For this reason, Vico's *Second Response* to the learned journal deserves extensive quotation:

> The criterion for possessing the science of something is to put it into effect /è il mandarla ad effetto/ and proving from causes is making what one proves. And this being is absolutely true because it is convertible with the made and its cognition is identical with its operation. This criterion is guaranteed for me by God's science, which is the source and standard of all truths. This criterion guarantees me that the only human sciences are the mathematical ones, and that they only prove from causes /e ch'esse unicamente pruovano dalle cause/. Beyond that, it gives me the way of classifying the non-scientific disciplines /notizie/ that are either certain on the basis of indubitable signs, or probable on the basis of good argument, or truelike on the basis of powerful hypotheses. Do you wish to teach me a scientific truth? Grant me the cause which is completely contained within me so that I invent a name at my will, and I establish an axiom regarding the relation that I set up between two or more ideas of things which are abstract and which are, consequently, both contained in me…. You could tell me, 'Make a demonstration of the assumed theorem', which is tantamount to 'Make true what you want to know'. And in knowing the truth that you have proposed, I shall make it; so that there will not remain for me any ground to doubt it because I myself have made it. The criterion of the 'clear and distinct perception' does not assure me of scientific knowledge. As used in physics or ethics, it does not yield a truth that has the same force as the one it gives me in mathematics. The criterion of making what is known gives me the /logical/ difference here: for in mathematics I know truth by making it; in physics and the other sciences the situation is different.[14]

This long quotation may help us to approach two *questiones vexatae* that have exercised the mind of a host of philosophers and Vichian scholars. These are: (a) in how far is Vico's thought original, i.e. is his constructivist criterion really new, as he never tires to repeat?; (b) is it philosophically sound to uphold that criterion and what are its historical credentials?

The first question has been dealt with with some acerbity, given Vico's reputation in Italy. Thus the great philosopher and Vichian scholar Benedetto Croce maintained that Vico's originality was beyond dispute, although *formal* precedents of his criterion could be found.[15] More recent research, however, makes it impossible to share Croce's view and tends to regard Vico's *Grundsatz* as one of the various formulations, perhaps the most felicitious one, of a whole family of ideas: the maker's knowledge tradition, or in Amos Funkenstein's phrase, the 'ergetic ideal'.[16] Its barest outline would be roughly as follows.

A tradition which goes back to Antiquity postulates that objects of knowledge are in an essential sense objects of construction, that knowing is a form of making, and that the human knower is such as maker or doer. This gnoseological principle has been advanced not so much as a method but as a mode of thinking or as an archetype of thought, and its polemical rejection is to be found in many significant places of ancient philosophical writing. Both Plato and Aristotle, for example, considered that ideal worth criticizing and consistently saw the human knower as a privileged beholder or enlightened user, never as a maker.[17] But there are some traces of this tradition that classical speculation was unable to erase. Thus in the theological reflections of Philo of Alexandria and in the

mathematical thought of Proclus we encounter the notion that knowing implies making or is a kind of making and vice versa.[18] God's knowledge of the world, for example, is pre-eminently knowledge by doing, i.e. knowledge *qua* Creator, and, as Christian theology gradually asserted itself, the difference between divine and human knowledge began to be perceived more and more as quantitative rather than as qualitative: God possesses infinite knowledge, but man's knowledge of some privileged truths contained in God's mind (i.e. mathematics) approaches that of the Deity. We know about the circle almost in the same way as God does, though we know much less; yet allegedly in the discovery of the pertinent mathematical truths we proceed discursively or step by step, whilst God's mind encompasses all cognitive operations in a single all-embracing intuition. In the same vein, Proclus argued that the mathematician projects his figures out of his own mind into a kind of imaginative space, where he proceeds to arrange his elements. He is therefore knower *qua* maker of mathematical. Now, these ideas gained much favour in the fifteenth century with Nicholas of Cusa (1401–64), who systematically dwelt on mathematics as a form of human and divine creation.[19] Later on, the new scientific movement made its own use of these notions under the guise of a legitimizing or metatheoretical topos—an undercurrent in philosophical thought which has rarely been spotted. Men like Cardan, Vives, Sanchez, Bacon, Galileo, Descartes, Mersenne, Gassendi, Pascal, Kepler, Locke, Boyle and many minor figures embraced the new, yet elusive but immensely powerful ideal that knowledge is achieved through doing or construction and gave to it different emphases and interpretations.[20] Thus, the understanding of this principle and the stress laid on its implication by each individual thinker was sometimes vastly different and even opposite (for instance, as regards the question whether this kind of knowledge by making referred exclusively to mathematics or also to the material fabrication or construction of a model of man and the universe), although the tenor of the ideal is perceptible in the most unlikely sources, sometimes with a sceptical slant. To confine ourselves to English figures, Joseph Glanville (1630–80) wrote that 'the Universe must be known by the same art whereby it was made', obviously meaning thereby that to know physical things amounts to being able to reconstruct them at a minute scale as far as it is humanly feasible.[21] Thomas Browne (1605–82) in *Religio Medici* (1642, written *c.* 1630) expressly calls God Artifex 'wise because he knows all things, and he knows all things because he made them all'.[22] With yet another aim in view, Thomas Hobbes (1588–1679) wrote that

> Of arts, some are demonstrable, others undemonstrable; and the demonstrable are those the construction of the subject whereof is in the power of the artist itself, who, in his demonstration, does no more but deduce the consequences of his own operation. The reason whereof is this, that the science of every subject is derived from a precognition of the causes, generation and construction of the same; and, consequently, where the causes are known, there is a place for demonstration, but not where the causes are to seek for. Geometry therefore is demonstrable, for the lines and figures from which we reason are drawn and described by ourselves. But because of natural bodies we know not the demonstration, but seek it from the effect, there lies no demonstration of what the causes be we seek for, but only of what may be.[23]

This is fairly similar to some of Vico's pronouncements above, especially if we compare it to Vico's hierarchy of knowledge as presented in *De Antiqmssima:*

> Mechanics is less certain than geometry and arithmetics, because it deals with motion, but with the aid of machines; physics is less certain than mechanics, because mechanics, treats the external motion of circumferences, whereas physics treats the internal motions of centres; morality /moralis/ is less certain than physics because the latter deals with those internal motions of bodies which are by Nature certain, whereas morality examines the motions of minds /motus animorum/ which are most deeply hidden /penitissimi/ and arise mostly from desire, which is infinite /et ut plurimum a libidine, quae est infinita, proveniunt/.[24]

Now it is highly unlikely that, with the possible exception of Proclus' *Commentary on the First Book of Euclid's Elements* translated into Latin by Francesco Barozzi (Padua, 1560), Vico had really come across an articulated intimation of the *verum factum* topos. This may be an excellent instance, therefore, of the kind of progress philosophy sometimes has in store, namely, the growth in tension and self-awareness in certain opaque areas, or the making finally explicit of a pattern of thought which philosophers had been utilizing on various occasions without properly identifying the common denominator of much of their thinking. Hence, one of Vico's claims to greatness lies surely here: he abruptly opens *De Antiquissima Italorum Sapientia* with the formulation of the epistemo-logical canon so many thinkers in his age were unwittingly using. According to D.P.Lachterman, that canon stands for nothing else but 'the Mark of the Modern', that is, the idea that the human mind should be compared to a pair of hands instead of to a faithful mirror—a notion which will eventually make a construct of 'reality' itself.[25] Of course, it would be utterly preposterous to claim that the convertibility of the true and the made can be unqualifyingly predicated of all of man's cognitive facets. But, since we do not know whether such an all-embracing formula exists or can exist, we may well greet the Vichian topos as a historically exact identification of one of the leading ideals of man's self-reflecting rationality. So much for the philosophical soundness of his principle.

Let us glance back at Vico's last quotation above. The 'moral science' had been demoted to the lowest rank in his epistemological hierarchy because the 'motions of minds' were supposedly inscrutable. Now it is surprising that what has been called since Croce's studies 'the second form of Vichian gnoseology' should take its starting-point precisely from the reversal of that position, that is, from the contention that it is man *qua* constructor or creator of human institutions ('the motions of minds') that should enjoy pride of place in the architecture of Vico's magnum opus, i.e. the *Scienza Nuova*.[26] Though nowhere termed 'principle' or 'corollary' *(degnità)* in the language that Vico adopts in that work, the *verum factum* topos is expressly expounded in three paragraphs (334, 349, and 374) as though it were a reminder of the epistemological pillar on which the new science is erected. Further yet, any attempt to salvage the cognitive credentials of natural science in the domain of the maker's knowledge tradition (as in *De Antiquissima Italorum Sapientia*) disappears altogether, and to the later Vico the foundation of this

knowledge of human affairs or *cose umane* entails a radical scepticism about the possibility of man's ever achieving a science of Nature. In Vico's own words:

> In the night of thick darkness enveloping the earliest antiquity, so remote from ourselves, there shines the eternal and never failing light of a truth beyond all question */questo lume eterno, che non tramonta, di questa verità/:* that the world of civil society has been made by men, and that its principles are therefore to be found */ritruovare/* within the modifications of our own human mind. Whoever reflects on this cannot but marvel that the philosophers should have bent all their energies to the study of Nature, which, since God made it, he alone knows; and that they should have neglected the study of the world of the nations, or civil world, which, since men have made it, men could come to know.[27]

Now it is important to realize that the Italian *ritruovare* in this paragraph may mean to find *again,* since many misunderstandings have arisen from it being translated as simply 'to find'. This sentence somehow implies that the human mind is posited by Vico as containing in its present and civilized stage all the patterns of thought that it has deployed or projected into the surrounding world, first in the process of humanization and then in the setting-up of the multifarious panoply of human institutions, social structures and political systems. So Vico is not simply asserting that it is men that make their history, but upholding a rather strong thesis as to the rationale of man's capacity to grasp that very history, even when he is not its direct author. Yet, critically considered, here lies one of Vico's most serious weaknesses, for he offers no proof as to the possibility of that *ritruovare* in the required gnoseological sense. In fact, the difficulty can be further pressed, for the 'motions of the mind' are most of the time an act of epistemic self-deception, as Lachterman argues and Vico seems to recognize in several places.[28] How can a rational mind—say, the historian's—run the gamut of all the irrational or non-rational moves that in Vico's own narrative of the origins of mankind have played so decisive a part? Besides, what counts as 'rational' in the mind of a Vichian historian? For example, the invention of what he considers the three master institutions of humanized life (religion, marriage and burial) did not arise from any kind of rational computation that we could understand and exactly reproduce in our own minds with absolute certainty. Simply to attribute them to our feelings of fear and of shame, as Vico does, appears a rather jejune thesis, given the vast plurality of forms that such feelings may take and may have in fact taken in man's psychological make-up:

> [M]an in his ignorance makes himself the ruler of the Universe, for in the examples cited /[i.e. those related to the origin of language and metaphor]/ he has made of himself an entire world. So that, as rational metaphysics teaches that man becomes all things by understanding them /homo intelligendo fit omnia/ this imaginative metaphysics shows /dimostra/ that man becomes all things by *not* understanding them /homo non intelligendo fit omnia/ and perhaps the latter proposition is truer than the former, for when man understands, he extends /spiega/ his mind and takes in /comprende/ the things, but when he does not understand, he makes the things out of himself and becomes them by

> transforming himself into them.
>
> [(*Sc. N.* par. 405)]

If this is really so and the possibilities of error become less and less frequent as we advance towards those stages of humanity which are supposed to resemble ours, then a good case could be made for arguing that Vico had in fact adumbrated the concept of *Verstehen,* that is to say, of cognitive empathy or imaginative understanding which man can use solely when handling the things that belong to man: motivations, fears, feelings and so forth. This is a mode of knowing (sometimes understood as a method of sorts) proper to the human sciences or *Geisteswissenschaften,* a mode or perhaps a method that by definition natural sciences lack.[29] This interpretation is suggested by, amongst others, Isaiah Berlin in his essays on Vico and the *Scienza Nuova*. According to Berlin, Vico discovered a hitherto 'unrecognized sense of knowing basic to all humane studies'. In his own words, this sense of knowing is no other but the sense

> in which I know what it is to be poor, to fight for a cause, to belong to a nation, to join or abandon a church or a party, to feel nostalgia, terror, the presence of a God, to understand a gesture, a work of art, a joke, a man's character or that one is transformed or lying to oneself.

One has to note, however, that in the above examples no time or place provision is made, so that it would appear that the experience of being poor—to quote one of his illustrations—is fundamentally the same in twentieth-century Britain and in tenth-century China: But it is highly unlikely that the notion of 'poverty' has remained unaltered throughout history and geography. Be that as it may, such things are known, Berlin continues,

> in the first place…by personal experience, in the second place because the experience of others is sufficiently woven into our own to be seized quasi-directly…and in the third place by the working (sometimes by a conscious effort) of the imagination. This is the sort of knowing that participants of an activity claim to possess as against mere observers; the knowledge of the actors as against that of the audience, of the 'inside' story as against that obtained from some 'outside' vantage point: knowledge by 'direct acquaintance' with my inner states or by sympathetic insight into those of others.[30]

Berlin's suggestion and description is indeed valid for much of Dilthey's, Weber's or Collingwood's theorization of the method and aim proper to the human sciences or to history. In the initial mist to which Vico's efforts belong, however, that characterization turns out to be far too clear, though undoubtedly Berlin is looking in the right direction. There is something else, in fact, that would make possible the operations of *Verstehen* in Vico's *Scienza Nuova*. Let us see how it might work.

The other key idea which Vico resorts to when attempting to guarantee the exactness of our re-entering into other men's minds or when trying to engage cognitively with the most remote past is the notion of Providence. This, as shall be shown, *semi-secular* idea

would guide the course of nations according to specifical, intellectually graspable patterns (Vico's *corsi* and *ricorsi*), constituting the so-called *storia ideale eterna* of that which 'was, is, and shall be'. Needless to add, in Vico's speculation the 'motions of the human mind' are to follow suit, over and above the personal will of the historical actors themselves. Now, this notion, no less than the *verum factum* topos, enjoys a reputable pedigree from the prophet Isaiah 10:5–8, to Maimonides's 'cunning of God', Mandeville's 'private vices, public benefits', Kant's 'hidden plan of Nature' *(verborgener Plan der Natur)* and, of course, Hegel's 'cunning of Reason' *(List der Vernunft)*—the last ones being wholly secular ways of translating an old theologoumenon. Amos Funkenstein has identified and richly documented this family of ideas. He has dubbed it 'the invisible hand explanations' in history, alluding to Adam Smith's celebrated simile in economics.[31] Now, Vico is quite amenable to this description in his explanation of history and of the manner man is capable of grasping it in the *Scienza Nuova*. Thus, while describing at length the slow process by which man has forged his own civil nature out of an initial brutish existence, Vico rejects all forms of diffusionism in the spreading of civilization and insists on a spontaneous process taking place in each nation and place. Yet, he emphasizes again and again that mankind is willing one thing and invariably achieving another, and that the oblique route that the nations follow (their *corso* and *ricorso*) is, as it were, guaranteed in its intelligible uniformity by a non-conscious effort of the historical subjects:

> For, though men have themselves made this world of nations… it has without doubt been born of a mind often unlike /diversa/, at times quite contrary to /tutta contraria/ and always superior to, the particular ends these men had set themselves…. Thus men would indulge their bestial lust and forsake their children, but they create the purity of marriage, whence arise the families; the fathers would exercise their paternal powers over the clients without moderation, but they subject them to civil power, whence arise the cities; the reigning orders of nobles would abuse their seigneural freedom over the plebeians, but they fall under the servitude of laws which create popular liberty; the free people would break loose from the restraint of their laws, but they fall subject to monarchs…. By their always acting thus, the same things come to be.[32]

Yet, this Providence is hardly a religious, not to say a Catholic, concept, for it is in-built in the very process of humanization (the birth of nations) and does not leave any room for any form of transcendence. Mankind would behave in that way with or without the supervision of an all-powerful Deity and, for this reason, Vico's Providence is, so to speak, a Providence without a God.

In the end, the five books and the 1,112 paragraphs of the final version of the *Scienza Nuova* of 1744 may seem to prove unequal to the gigantic task Vico had glimpsed himself accomplishing. For one thing, it was necessary to command far more philological and anthropological scholarship, and especially to be in possession of a more worked-out methodological thought as regards its organization and presentation.[33] Nevertheless, truncated as it now appears, Vico's accomplishment in the *Scienza Nuova* is admirable in

terms of its originality in the role that he (perhaps unwittingly) attributed to the non-rational in man's protracted search for his own social being: the inquiry into 'truth' in its historical dimension, into the creation of the city and of civilized existence, and into the capacity we possess—or we lack—of grasping other men's expectations and fears. In a word, Vico was trying to formulate the credentials we can legitimately attribute to historical knowledge of any sort. If neither the *verum factum* canon nor the labyrinthine expositions of the *Scienza Nuova* appear to us wholly satisfactory, we should perhaps remember that the theory of truth, like the Greek Argos of old, has a hundred eyes. The merit of having spotted several of them, and not the feeblest ones, is the indisputable basis of Vico's intellectual achievement.

7 On the young Vico's scientific background, cf. P.Rossi's historical account, 'Ancora sui contemporanei di Vico', *Rivista di filosofia* 76(1985): 465–74; M. Torrini, 'Il problema del rapporto tra scienza e filosofia nel pensiero del primo Vico', *Physis* 20(1978): 103–21. J.Barnouw has reviewed the different trends of research in [13.29], 609–20. Barnouw's thesis does not refer specifically to the *De Antiquissima Italorum Sapientia,* but the author maintains that 'Vico's development…supports the view that the new sciences of the 17th century, from Galileo on, provided the crucial inspiration and model for the formation of the human sciences' (p.609). This is more or less the route Comte took, but it hardly squares with the methods of Vico in the *Scienza Nuova,* despite his own claim that he is applying Bacon's method (par. 163; cf. also 137, 359). Cf. n. 33 below.

8 Cf. Richard Popkin, *A History of Scepticism from Erasmus to Spinoza,* rev. edn. London, University of California Press, 1979, Preface, p. xvii.

9 *De Antiqmssima Italorum Sapientia* was also called *liber prias metaphysicus;* in Vico's original project, a *liber secundus physicus* and a *liber tertius moralis* were to follow. Some notes prepared for the second book were published fifty years after Vico's death, assembled as a monograph entitled *De Aequilibrio Corporis Animantis,* a book now lost. Vico appears to have begun working on the *Scienza Nuova* fairly soon after the publication of the *De Antiqmssima*. Cf. [13.8], Introduction.

10 Vico stresses that the cogito is a *sign,* but not a *cause* of my being. Vico uses here the Greek term *tekmērion,* a word of Stoic echoes. This is Vico's sceptic reply to Descartes:

> The dogmatist…would allow that the sceptic acquires knowledge of his being from awareness of his thinking, since the unshakable certainty of existence is born from his awareness of thinking. And, of course, no one can be wholly certain that he exists unless he makes up his own being out of something he cannot doubt. Consequently, the sceptic cannot be certain that he is because he does not gather his existence from a wholly undoubted principle. To all this the sceptic will respond by denying that knowledge of being is acquired from consciousness of thinking. For, he argues, to know *(scire)* is to be cognizant *(nosse)* of the causes out of which a thing is born. But I who think am mind and body, and if thought were the cause of my being, thought would be the cause of the body. Yet there are bodies that do not think. Rather, it is because I consist of body and mind that I think; so that body and mind united are the cause of thought. For if I were only body I would not think. If I were only mind, I would have /pure/ intelligence. In fact, thinking is the sign and not the cause of my being mind. But the sure sign *(techmerium)* is not the cause, for the clever sceptic will not deny that certainity of sure /rational/ signs, but just the certainty of causes.
>
> ([13–8], 55–6; [13–6], 72–5)

11 [13.8], 57; *De Antiquissima,* I, iv [13.6], 741. This subchapter is entitled 'God is the comprehension of all causes—Divine Knowledge is the norm of human knowledge'.

12 [13.3], 63–4; [13.8], 4 5f. (italics added). Cf. also the following: 'Amongst human sciences only those are true which…have elements which we coordinate and are contained within ourselves…and when we put together such elements, we are becoming authors of such truths /et cum ea componimus, vera quae… cognoscimus, faciamus/ [13.3], 62f, 68f, 73f.

13 [13.3], 149; [13.8], 157. In [13.3], 155 Vico recognizes that the value of every thing he is proposing does not stem from 'the force and evidence of the reasons advanced', for in lexical questions usage and authority overshadow the innermost meanings of speech.

14 [13.8], 167; [13.3], 156.

15 [13.48], 233–59. Cf. also G.Gentile, *Studi vichiani: Lo svolgimento della filosofia* vichiana (1912–15), *Opère Complete,* vol. xvi, Florence, Sansoni, 1963[3].

16 Amos Funkenstein, *Theology and the Scientific Imagination from the Middle Ages to the Seventeenth Century,* Princeton, NJ, Princeton University Press, 1986, 290–345; esp. 296–9; R.Mondolfo, *Il verum factum prima di Vico,* Bari, Guida, 1969, and the criticisms levelled against this book by Maria Donzelli, 'Studi vichiani e storia delle idee. (A proposito di un saggio di Rodolfo Mondolfo)', *Filosofia* 21(1970): 33–48; and A.Pérez-Ramos, *Francis Bacon's Idea of Science and the Maker's Knowledge Tradition,* Oxford, Clarendon, 1988, pp. 48–62, 167–96.

17 In Aristotle's *Politica* 1282a17ff. we read:

> About some things the man who made them would not be the only nor the best judge, as in the case of professionals whose products come within the knowledge of lay men also (hoi mē echontes tēn technfin): to judge a house, for instance, does not belong only to the man who built it, but in fact the man who uses the house (the householder) will be an even better judge of it, and a steerman judges a rudder better than a carpenter, and the diner judges a banquet better than the cook.
>
> [(Loeb edn, trans. H.Rachman, 227)]

Plato resorted to the same sort of confutation in several places (*Euthydemus* 289A-D, *Cratylns* 390 B, *Meno* 88 E), and especially in *Republic* 601 E-602 A:

> The user of anything is the one who knows most of it by experience, and he reports to the maker the good and bad effects in the use of the thing he uses. As, for example, the flute-player reports to the flute-maker which flutes respond and serve rightly in flute-playing, and will order the kind that must be made and the other will obey him…. The one, then, possessing knowledge (epistēmēn) reports about the goodness or badness of the flutes, and the other, believing, will make them…. Then, in respect to the same implement, the maker will have right belief (pistin orthēn) about its excellent and defects from association with the man who knows,…but the user will have true knowledge.
>
> [(Loeb edn, trans. P.Shorey, 445–7)]

It is tempting to perceive in these statements a dim reflection of social conditions amongst the Greeks.

18 Cf. Philo of Alexandria (*floruit c.* AD 40), *Quod Deus Immutabilis sit, i*n *Complete Works* I, 22–3, (Loeb edn, trans. F.H.Colson and G.H.Whittaker, repr. 1960); cf. also *De Opificio Mundi* I, 20–1. For a treatment of this topic by mediaeval Jewish and Christian philosophers, in the context of God's self-knowledge *qua* Creator, cf. A.Funkenstein, *Theology and the Scientific Imagination,* p. 291f. For mathematics, cf. Proclus' *Commentary on the First Book of Euclid's Elements,* ed. and trans. P.R.Morrow, Princeton, NJ, Princeton University Press, 1970, Prologue 11–12 and 64. The soul is equipped with mathematical patterns *(paradeigmata)* which it brings forth as projections *(probolai)* of its own making. Proclus' Platonism is fairly similar to Vico's in that both purport to find the seeds of truth hidden in man's creative mind.

19 Cf. [13.24], 321ff., Hans Blumenberg, '"Nachahmung der Natur": zur Vorgeschichte des schöpferischen Menschen', *Studium Generale* 10 (1957): 266–83), and *Cusanus und Nolanus,* Frankfurt-on-the-Main, Suhrkamp, 1973.

20 Cf. Vinzenz Rüfner, 'Homo secundus Deus. Eine gestesgeschichtliche Studie zum menschlichen Schöpfertum', *Philosophisches Jahrbuch* 63(1955): 248–91; A. Funkenstein, *Theology and the Scientific Imagination,* pp. 290–345; Jürgen Klüver, *Operationismus. Kritik und Geschichte einer Philosophie der exakten Wissenscbaften,* Stuttgart, Frommann-Holzboog 1971, pp. 38–52; and A.Perez-Ramos, *Francis Bacon's Idea of Science,* pp. 135–98.

21 Joseph Glanvill, *Plus Ultra, or the Progress and Advancement of Learning,* London, 1668, p. 35.

22 *Religio Medici* I, 13 (1642/43, written in the mid-1630s), ed. with Introduction and notes by C.A.Patrides (Harmondsworth, Penguin, 1977, repr. 1984), p. 74.

23 'Six Lessons to the Savillian Professors of Mathematics', *English Works,* ed. W. Molesworth, London, 1838–45, VI, pp. 183–4; repr. Scientia Verlag, Aalen 1961–6. Cf. Arthur Child, *Making and Knowing in Hobbes, Vico and Dewey,* Los Angeles, University of California Press, 1953, pp. 271–83, and W.Sacksteder, 'Hobbes: the Art of the Geometricians', *Journal of the History of Ideas* 18(1980): 131–46, and his 'Hobbes: Geometrical Objects', *Philosophy of Science* 48(1981): 573–90. Mathematics was not, however, the sole direction in which Hobbes developed his constructivist stance. As with the later Vico, there is a second interpretation of this topos, once it is realized that the State, no less than mathematicals, is a man-made product:

> To men is granted knowledge only of those things whose generation depends upon their own judgement. Hence the theories concerning quantity, knowledge of which is called geometry, are demonstrable. There is a geometry and it is demonstrable because we ourselves make the figures. In addition, politics and ethics, namely, knowledge of the just and the unjust, of the equitable and the unequitable, can be demonstrated a priori: in fact its principles, the conception of the just and the equitable and their opposites, are known to us because we ourselves create the causes of justice, that is, laws and conventions.
> *De Homine* II, 10, *Opera Philosophica quae latine scripsit* (same edn) II, pp. 92–4; cf. also *De Cive* XVII and *De Corpore* XXV

24 [13.3], 68–9; [13.8], 52. Vico, however, tries to provide a rationale for successful explanation in physics:

> Those theories /ea meditata/ are approved in physics which have some similarity with what we do /simile quid operemus/. For this reason, hypotheses about the natural order are considered most illuminating and are accepted with the fullest consent of everyone, if we can base experiments on them, in which we make something similar to Nature.
> (ibid.)

25 Cf. D.P.Lachterman, *The Ethics of Geometry. A Genealogy of Modernity,* London, Routledge, 1989, pp. 1–24. For other expositions of the *verum factum* topos, cf. W.Vossenkuhl, *Wahrheit des Handels. Untersuchungen zum Verhältnis von Wahrheit und Handeln,* Bonn, Bouvier, 1974, pp. 1–43; Stephen Otto, 'Vico als Transzendentalphilosoph', *Archiv für Geschichte der Philosophie* 62(1980): 67–80, and 'Interprétation transcendentale de Paxiome "verum et factum convertuntur" ', *Archives de Philosophie* 40(1977): 13–39. Against this interpretation, cf. F.Fellmann, '1st Vicos "Neue Wissenschaft" Transzendentalphilosophie?', *Archiv für Geschichte der Philosophie* 61(1979): 68–76. Many points of this debate are summarized in J.C.Morrison, 'Three Interpretations of Vico', *Journal of the History of Ideas* 39 (1978): 511–18.

26 The *Scienza Nuova* is a rather ambitious work. It purports to contain: (a) a 'civil and rational theory of Providence', i.e. a demonstration of the way Providence supposedly acts in social life; (2) a 'philosophy of authority', or on the origins of property *(auctores);* (3) a 'history of human ideas', especially the oldest ones in the religious field; (4) a 'philosophical critique' of the most remote religious traditions; (5) an 'eternal ideal history', showing the always-repeated route the nations run; (6) a 'system of natural law of the nations', based on primitive necessity and usefulness; and (7) a science of the oldest and darkest beginnings or principles of 'universal human history', where Vico tries to interpret the hidden truth of mythological

fables. All in all, Vico aims at what we might call an exploration of the 'savage mind' in the age of gods and heroes. In this sense the *Scienza Nuova* purports to advance a rational theory of the *mondo civile*. Cf. K.Löwith, *Meaning in History,* Chicago, University of Chicago Press, 1949, ch. vi.

27 Par. 331. [13.3], 461; [13.5], 96. Vico, however, does not forget the theological sanction of the *verum factum* topos in par. 349:

> For the first indubitable principle posited above /par. 331/ is that this world of nations has certainly been made by men, and its guise /la guisa/ must therefore be found within the modifications of our own human mind /le modificazioni della nostra mente umana/. And history cannot be more certain than when he who creates the things also narrates them. Now, as geometry, when it constructs the world of quantity out of its elements, or contemplates that world, is creating it of itself, just so does our science/ create for itself/ the world of nations/, but with a reality greater by just so much as the institutions having to do with human affairs /gli ordini d'intorno alle faccende degli uomini/ are more real than points, lines, surfaces and figures are. And this very fact is an argument, O reader, that these proofs are of a kind divine and should give thee a divine pleasure, since in God knowledge and creation are one and the same thing.
>
> Cf. [13.3], 467; [13.5], 104f.

28 'Vico and Marx: Notes on a Precursory Reading', [13.21], 38–61, esp. 51.

29 Cf. Karl-Otto Apel, *Die Erklären-Verstehen Kontroverse in transzendeltalpragmatischer Sicht,* Frankfurt-on-the-Main, Suhrkamp, 1979; J.R.Martin, 'Another Look at the Doctrine of Verstehen', *British Journal for the Philosophy of Science* 20 (1969): 53–67; W.Bourgedis, 'Verstehen in the Social Sciences', *Zeitschrift für allgemeine Wissenschaftstheorie* 7 (1976):26–38.

30 I.Berlin, 'Vico's Concept of Knowledge', in [13.18], 375f. For a criticism of Berlin's views cf. [13.84], 159ff.

31 A.Funkenstein, *Theology and the Scientific Imagination,* pp. 202–89, esp. pp. 279–89. Vico's secularized Providence and the autonomy he attributes to the course of human history bears a strong resemblance with some of Spinoza's doctrines, despite Vico's claims about man's free will. Cf. A.Pons, 'L' idee de développement chez Vico', in *Entre Forme et Histoire,* ed. O.Bloch, B.Balan and P.Carrive, Paris, Meridiens Klincksieck, 1988, pp. 181–94; [13.77], 49–68; J.Samuel Preus, 'Spinoza, Vico and the Imagination of Religion', *Journal of the History of Ideas* 49 (1988): 71–93.

32 *Sc. N.* par. 1108; [13.5], pp. 700f. Cf. also par. 341:

> But men, because of their corrupted nature, are under the tyranny of self-love, which compels them to make private utility their chief guide. Seeking everything useful for themselves and nothing for their companions, they cannot bring their passion under control /porre in conato/ to direct them towards justice. We thereby establish that man in the bestial state desires only his own welfare /la sua salvezza/; having taken wife and begotten children, he desires his own welfare along with that of the nation; when the nations are united by wars, treaties of peace, alliances, and commerce, he desires his own welfare along with that of his family; having entered upon civil life, he desires his own welfare along with that of his city; when its rule is extended over several peoples, he desires his own welfare along with that of the

> whole human race. In all these circumstances man desires principally his own utility. Therefore, it is only by divine providence that he can be held within these institutions /dentro tali ordini/ to practice justice as a member of the society of the family, the city, and finally of mankind. Unable to attain all the utilities he wishes, he is constrained by these institutions to seek those which are his due: and this is called just. That which regulates all human justice is therefore divine justice, which is administered /ministrata/ by divine providence to preserve human society.
>
> (*Scienza Nuova,* par. 341, [13.5], pp. 101f.)

Because of that, Vico adds in the next paragraph (342) that his science must be a rational civil theology of divine providence (cf. also par. 385). On this question, see S.R.Luft, 'A Genetic Interpretation of Divine Providence in Vico's *New Science', Journal of the History of Philosophy* 30 (1982): 151–69. On the method of the *Scienza Nuova* Vico is impenetrably opaque. He claims (n. 7 above) that he is deploying Bacon's method in human affairs (par. 163), but Vico mentions the somewhat atypical *Cogitata et Visa* insted of, as expected, the *Novum Organum*. E.McMullin has studied this question in 'Vico's Theory of Science', in [13.20], 60–89. He terms Vico's method 'hypothetico-suggestive' (p. 83).

BIBLIOGRAPHY

Works in Italian and English

13.1 *Opere di Giambattista Vico,* ed. with textual and historical notes by Fausto Nicolini, in collaboration with Giovanni Gentile (vol. i) and Benedetto Croce (vol. v), 8 vols, Bari, Laterza, 1911–41.

13.2 *Opere di Giambattista Vico,* ed. with an Introduction and notes by F.Nicolini, Milan and Naples, Ricciardi, 1953.

13.3 *Opere Filosofiche,* texts, translations and notes by Paolo Cristofolini, with an Introduction by Nicola Badaloni, Florence, Sansoni, 1971.

13.4 *Opere Giuridiche,* ed. Paolo Cristofolini with an Introduction by Nicola Badaloni, Florence, Sansoni, 1974.

13.5 *The New Science of Giambattista Vico,* trans. with an Introduction by T.G. Berlin and M.H.Fisch, Ithaca and London, Cornell University Press, 1948, repr. 1988.

13.6 *The Autobiography of Giambattista Vico,* trans. T.G.Bergin and M.H. Fisch, Ithaca and London, Cornell University Press, 1944, repr. 1975.

13.7 *On the Study Methods of Our Time,* trans. with an Introduction and notes by Elio Gianturco, Indianapolis, Bobbs-Merrill, 1965.

13.8 *On the Most Ancient Wisdom of the Italians, Unearthed from the Origins of the Latin Language, Including the Disputation with the Giornale de' Letterati d'Italia* trans. with an Introduction and notes by L.M.Palmer, Ithaca and London, Cornell University Press, 1988.

13.9 *Vico*: *Selected Writings,* ed. and trans. L.Pompa, Cambridge, Cambridge University Press, 1982.

CHAPTER 14
Rousseau and Burke

Ian Harris

Those who thought about the social and political order directed their attention to a new centre of interest towards the end of the seventeenth century. It was not that speculation about political authority was forgotten, but rather that it came to be complemented with a concern for the social order. This concern was primarily political, in the sense that it focused on how people might live well in groups. Sometimes this addressed their morals (the french term *moeurs*[1] captures this meaning) and sometimes their prosperity. To put the matter generally, where the political theorists of the preceding century had looked at politics with an eye chiefly to preserving the citizen and his interests, their successors in the eighteenth century looked much more at how people might live well. Public morals, civic culture, social justice, education (including aesthetic education), 'improvement' in its manifold forms and political economy were their preoccupations.

The change may be read not least in theorists' use of reason. Reason was supposed more versatile then than some think it is now. It was supposed to disclose ethical truths and to be instrumental in governing conduct. It is easy to see how the former doctrine took hold: those who thought about morals in terms of natural faculties (as opposed to the information provided by revelation) tended to make use of natural law thinking. Natural law, being concerned in part with the benefits of acting in certain ways, focused on the correlation of means and ends. Hence good and evil would tend to be conceived in terms of reason. By the same measure it was easy to think of reason selecting courses of action, which the will then executed. Of course, not all thinkers were ethical rationalists: but it was true, too, that sentimentalists (not least Hutcheson) supposed that reason, if not the source, was a central element in moral thought and practice.[2] The point appeared clearly in Locke, who indicated that God 'having given Man an Understanding to direct his Actions, has allowed him a freedom of Will, and liberty of Acting, as properly belonging thereunto'.[3]

This implies that the understanding was a means of virtue. Where reason in politics had been directed primarily towards matters of preservation it was now directed also towards virtue. Robert Wallace illustrated this when he remarked that

> the more clear and extensive Views Men have of the exact Regularity…that obtains in all the Works of Nature, they must be more sensible of the Excellency, Beauty and Advantages of that Order, that reigns…they must admire it in general more highly, and be less disposed to transgress the Laws of Order in any particular Case.

It was not only nature that would stand approved, but the human world too, for 'the Order

of the natural will lead them to love and admire the Order of the moral World, and the Laws which regulate Society and human Commerce'.[4] Thus knowledge and virtue were taken to be correlated.

Burke began as a representative of this cast of mind. If that had been his destination as well as his beginning, he would not have been a very remarkable thinker. But even initially there was more to him than that and, in the course of his speculations he encountered a thinker who held diametrically opposed views. That was Rousseau. It was the way in which Burke developed his special views, including his response to Rousseau, and the way in which Rousseau developed his own line of speculation that marked them as important thinkers.

I

Edmund Burke was born in 1729 or 1730, the a son of an Irish attorney. After education at Trinity College, Dublin he crossed St George's Channel and thereafter rose rapidly in English society, first obtaining a considerable reputation as a writer and then as a politician, becoming a member of the House of Commons, a privy counsellor and, on two occasions, a minister just below cabinet level. He is best known to posterity for his *Reflections on the Revolution in France* (1790), but this work was the product not least of his thought over the preceding forty years, especially that of the 1740s and 1750s. What sort of thinker was he? His mind was equal to a wide range of concerns—theology, aesthetics, moral philosophy, history and political theory. These interests were intimately connected. Burke's theoretical writings suggested that the world was patterned unequally.

When Burke was an undergraduate at Trinity, he and his friends founded a society devoted to improving themselves and the world. We discover from the club's minute book and from the writings which Burke published at the same period that he concerned himself especially about three matters: the revealed word and its effectiveness; aesthetics and virtue; and the possibilities of power and wealth for the good of society.

The first concern was expressed in 'an extempore commonplace of the Sermon of Our Saviour on the Mount' and was amplified when Burke asserted 'the superior Power of Religion towards a Moral Life'.[5] For the second Burke assumed that the arts and virtue went together, as 'the morals of a Nation have so great Dependence on their taste… that the fixing the latter, seems the first and surest Method of establishing the former'.[6] In January, 1748 he asked, 'who…is so audacious as to affirm Knowledge begets Vice?'. Wealth and power entered into a debate on the merits of the lord lieutenant of Ireland, in which Burke observed that 'the opportunity a man can have of promoting ye good of his Fellow creatures, is proportionate to his wisdom, his wealth, or his power'. He dwelt later on the necessity of property—'a man's property's his life'—and on how the gentry of Ireland could improve their estates and so benefit the whole community. In March 1748 he descanted on the example of 'a Gentleman of Fortune' who had used his wealth for the good of his dependants through improvement. He had introduced manufacturing onto his estate, so that 'his Tenants grew rich, and his Estate increased daily in Beauty and Value'. Burke looked to the propertied order for the good of his country, moral and economic (though lamenting on occasion that they usually did not provide it).[7] These concerns,

diverse as they seem, came to be related in one theory.

Burke embraced these three into a single understanding through the idea of inequality. Let us start with the revealed word. How could revelation—of all things, one might ask—fit this description? The answer lies in deism.

Deism may be defined as the view that the information mankind requires as a condition of salvation is obtained from natural means alone. By natural was meant what could be collected through human faculties, especially reason, as distinct from revelation. It was revelation, in fact, about which the deists had qualms. For they assumed that God willed that everyone in principle could be saved. This implied that each person had the minimum means needed for salvation. This could not include revelation, for the Bible had not been available to all people at all times. It followed that the revealed word was at the very least superfluous to salvation and at worst not actually of divine authorship. The deists considered that mankind's own faculties, especially his reason, could supply him with the information he needed.

Burke found deism obnoxious. His observations on the Sermon on the Mount[8] declared a preference for revelation, arguing that it was superior to reason as a means of salvation. Shortly afterwards he suggested that Dublin's deists were really enemies to morality.[9] For if revelation was integral to God's design of saving man, to deny its authenticity was a denial of His plan.[10] To deny God's providence might in itself be held to signify atheism, or scepticism about revelation might be felt to reflect a complete unbelief. At any rate whilst Burke could later distinguish deists from atheists,[11] he was not ultimately much concerned about the difference.[12]

To uphold revelation in the face of deism implicitly was to prefer a pattern of divine conduct involving inequality. To make revelation necessary to salvation is to found it on a form of inequality, for historically revelation was diffused over only a limited part of the globe: God's favour was not extended equally to all. As such, revelation implies the concession that at least one part of God's government was conducted on unequal lines. Since that part, the business of salvation, was obviously the most important to man and God was held to work in a constant fashion, we might expect that others would conform to the same pattern. So we find in Burke's views on the social order.

Before turning to them, it is as well to turn to what Burke rejected. Again deism figures, this time not merely for itself but in the logic Burke read into it. Deism, in his view, opened up unpleasant implications for society. One deist in particular might be read in this way. The posthumous publication of Bolingbroke's works was a literary event and one especially interesting to Burke. For to provide deism with a conceptual guarantee one had to reject God's particular Providence—His concern with individual destinies—for that obviously embraced revelation. Most deists were not so thorough: but Bolingbroke was.[13] His view was objectionable on wider grounds. Besides discounting revelation it implied that God exercised no direction over specific cases. Individual events and institutions would not reflect His intentions. The social order, on this reading, need not answer to any beneficial purpose. Such a view would be unlikely to appeal to Burke, who at Trinity had sensed benevolent possibilities in the unequal order of his day.

Yet to understand the form taken by Burke's argument about the social order, we need to consider another thinker. For shortly after Bolingbroke's *Works* were issued there appeared a work which attributed a range of miseries to just the form of social order that

Burke approved. This was Rousseau's *Discourse on the Origin and Foundations of Inequality amongst Men,* a work of cardinal importance for understanding both Burke and Rousseau.

II

Jean-Jacques Rousseau had been born at Geneva in 1712. His early life was marked not least by dependence and by the practice of the fine arts. Dependence appeared first in his being apprenticed to an engraver, Rousseau's father having come down in the world; next, in a more agreeable but ultimately unsatisfactory manner, in the bounty of Madame de Warens; and then in a role as secretary to the Comte de Montaigu, France's ambassador to Venice, who ultimately dismissed Rousseau and refused to pay his salary. Thereafter he enjoyed success as a man of letters, writing musical criticism and composing operas. If it were necessary to seek a biographical reference for his doctrines, we could say that his dislike of dependence outweighed his desire to be applauded for his artistic and intellectual prowess.

For the central assumption of Rousseau's thought in the earlier 1750s was that the supposed correlation between knowledge and virtue was mistaken. Accordingly the view of things that followed from it was mistaken too.

Rousseau's *Discourse…on…the Arts and Sciences* studied the moral effect of knowledge and was submitted in a competition for an essay prize sponsored by the Academy of Dijon in 1750.[14] Rousseau argued that virtue and ignorance were correlated and so were vice and knowledge: that 'our minds have been corrupted in proportion as the arts and sciences have been improved'. He considered that knowledge had been deployed to make people behave pleasingly rather than virtuously. He assumed that the disposition of a human being, as it came from the hand of nature, would be read in its behaviour. Here he assumed that a condition of an action's being good was that it manifested the disposition of the agent, preferably a disposition to do good. But knowledge, Rousseau continued, showed us how to mould our actions in order to hide our dispositions. Thus knowledge concealed the truth. In effect natural people were truthful and sophisticated ones were deceivers. Rousseau went on to suggest that knowledge was encouraged by vice. It was not merely that knowledge concerned vice (legal science was parasitic on crime, for instance), but more especially that those forms of knowledge that pandered to vice (or were unconnected with virtue at any rate) were favoured and those that encouraged virtue were discountenanced. The accomplishments for which people were rewarded were not devoted to any good end, so the 'question is no longer whether a man is honest, but whether he is clever'. The Academy awarded the prize to Rousseau, perhaps intimidated by his asservation that 'there are a thousand prizes for fancy discourses and none for virtuous conduct'.[15]

Rousseau's inverse correlation between virtue and knowledge, however, lacked something. It lacked an explanation of how this situation had arisen. In order to produce one, Rousseau took himself to the resources of natural law thinking and transformed them.

Natural law thinking had emphasized not only reason but interdependence, whether in

the form of sociability or weakness. That is to say it had considered the human agent in abstraction from society and government and made two sorts of judgement. One of these was that man was a rational creature, capable of deciding what conduced to certain ends, what was right and how to act. The end that the agent had in mind, primarily, was self-preservation. The other judgement was that reason adverted to the dependent character of the species. This might take the form of suggesting that people were dependent on God, as in Locke. More generally it suggested that they were not constituted to subsist independently of each other, for instance because they were too weak to subsist individually in the face of their physical environment.[16] An instinct for the company of other human beings produced a similar inference: that if each agent was to obtain the ends he required other people were necessary. Hence the dependent nature of man suggested society.

The same line of reasoning suggested that government was needed, in order to secure the benefits of society. For despite their needs for others, people tended to conflict, largely over the possession of resources. They were sociable but not peaceable: and this was part of what Kant intended by describing the human condition as a social sociability.[17] Hence government was required to restrain human aggression.

Rousseau proceeded to stand these judgements on their head in the interest of explaining his inverse correlation of virtue and knowledge. He asserted that by nature mankind was neither sociable nor weak, but rather asocial and strong; not dependent but independent. Neither was man given to aggression, but rather peace,[18] If these assertions were made out it followed that society and government did not arise as the products of rational reflection on the human condition. They might be the outcome of something rather more unacceptable.

To make out his case, Rousseau evolved a dramatic sequence of history, running from mankind's natural condition to civil society. Rousseau needed to conduct two stories to achieve his ends. He wished to link virtue with ignorance and vice with knowledge. So he had to explain both the transition from virtue to vice and the growth of knowledge. To achieve these goals he needed to posit a figure of virtue and ignorance, to show the loss of virtue and to explain how knowledge accompanied that loss.

The first requisite was achieved in the exemplary figure of the savage, who also provided a way of pointing to the effects of knowledge. The savage embodied at once virtue and ignorance. He was virtuous in that he gave full rein to his natural sentiments and 'all' that comes from nature 'will be true'[19] Rousseau said. These comprised powerful instincts for self-preservation and for compassion. We should note in particular that from compassion flowed the 'social virtues' and that the savage's compassion was very strong. So he had the seeds of virtue. On the other hand he lacked the characteristics which would lead him to develop a knowledge that would encourage vice. The savage did not reason. Why? The savage, who was strong, had no need of others to assist him in self-preservation. Besides, he had no instinct for the society of other humans. He was therefore solitary.

But if a man was weaker he would need others. Needing them he would have to combine with them; and being constantly exposed to their company he could not but compare himself with them. This, of course, was an act of reason. Reasoning thus cultivated in each individual a sense of his distinctness from others. Under these

conditions, if a man prospered, he would have little regard for others, whom he would see as significantly different from himself. So reasoning was a condition of the weakening of compassion. To compare one's situation with that of the pitiable, Rousseau thought, dried up mercy and led a man to say 'Perish if you will, for I am secure'.[20] So where there was ignorance there was virtue: and knowledge was a condition of the reverse of virtue, a regard only for oneself.[21]

How did Rousseau fill out the condition under which the latter would flourish, namely the prosperity of one and the inferiority of another? Obviously he required people to enter society, which made comparison possible. He also needed to make one person inferior or, more exactly, dependent on another. The first was a condition of the second, for 'it is impossible to make any man a slave', he noted, 'unless he be first reduced to a state in which he cannot do without the help of others'.[22] The transition was accompanied through a loophole in the savage's independent isolation.

Rousseau supposed that the species faced difficulties that encouraged thought and with thought co-operation and enmity. The savage was soporific and unreflective by nature, living off the fruits of the earth. But competition for those resources from other animals or from other people (for Rousseau mysteriously assumed an increase in population) encouraged reflection on how to overcome his circumstances. In part this meant inventing tools and in part associating with other humans to gain benefits unobtainable individually. But, at any rate, human society became established. Now Rousseau did not suggest that society as such was reprehensible or that the acquisition of knowledge was itself vicious. He did indicate, however, that society soon assumed an unequal, indeed hierarchical form in which knowledge became the instrument of vice and misery.

Once in society, comparison made one person eager to excel another. Soon human intelligence devised instruments by which a man could outstrip others in accumulating property. This was achieved through the discovery of agriculture and iron, for the art of iron working facilitated extensive cultivation. This required many hands: and it precipitated a state of inequality and, thereby, dependence. 'From the moment one man began to stand in need of the help of another', Rousseau wrote,

> from that moment if appeared advantageous to any one man to have enough provisions for two, equality disappeared, property was introduced, work became indispensable, and vast forests became smiling fields, which man had to water with the sweat of his brow and where slavery and misery were soon to germinate and grow up with the crops.[23]

Slavery and misery grew up because there were, on the one hand, those who had acquired property, and on the other those who had not and, of course, here was the condition under which a knowledge of one's own prosperity dried up one's compassion for others: 'the privileged few…gorge themselves with superfluities, while the starving multitude are in want of the bare necessities of life'. So the poor, in the face of a lack of compassion, lacked the necessities of life.

The rich, however, were also miserable. The withering of compassion and the triumph of self-regard made a man ask, not what it was right for him to do, but what should he do to impress others with his importance. Thus he became dependent on the opinion of

others and was only happy when he captured their attention; in which, since they were as much absorbed by their self-regard as he was by his, was a search for happiness in vain. Meanwhile, in order to show their magnificence, the rich multiplied their trinkets, contrivances and all the apparatus of living far beyond their real needs. It was to satisfy these superfluous wants, of course, that the arts and sciences laboured.[24] We need hardly insist that the bad effects of the arts and sciences were now obvious, for 'from society and the luxury to which it gives birth arise the liberal and mechanical arts, commerce, letters, and all those superfluities which make industry flourish, and enrich and ruin nations'.[25] The essential point was that man ran sharply away from his natural sentiments and moral conduct to unnatural affections and that these unnatural feelings fed on social inequality, particularly in property.

Thus we have Rousseau's *Discourse on the Origin and Foundations of Inequality amongst Mankind* (1755). This piece, like its predecessor, was occasioned by the Dijon Academy. The subject prescribed was whether natural law authorized inequality. Rousseau took over self-preservation from established thinking about natural law: but hadaltered much else in order to show that society had developed as the violation rather than the product of human nature. This time he did not win the prize.

III

Rousseau did not impress Burke during his visit to England in 1766. Burke, who 'had good opportunity of knowing his proceedings almost from day to day', was sure that 'he entertained no principle either to influence his heart, or to guide his understanding but *vanity*', and in fact described him as 'the great professor and founder of *the philosophy of vanity*'.[26] This was a distaste conditioned by an intellectual origin. For the references to vanity suggest that Burke thought Rousseau knew that what he was saying was wrong, as in the declaration of Burke's friend Dr Johnson that 'a man who talks nonsense so well, must know that he is talking nonsense'.[27]

Burke had good reason to remark upon Rousseau. The Genevan's arguments inverted his own assumptions. With Rousseau knowledge accompanied vice and the growth of property produced neither 'Beauty' nor 'Improvements'. When Burke had asked who would affirm knowledge begot vice he could hardly have guessed that someone would be 'senseless' enough to assert 'its Opposite Quality' that 'Ignorance should be the Parent of Virtue'.[28] No doubt he attributed vanity to Rousseau because this seemed the only explanation for the paradoxical denial of what he took to be unexceptional truths.

Certainly Burke attributed views of the 'Opposite Quality' to Rousseau. *A Vindication of Natural Society* illustrated the logic of Bolingbroke's deism, which had asserted the sufficiency for salvation of the truths which man could learn from his natural faculties, by pushing its position to the Rousseauvian extreme. If man's natural endowments sufficed for that purpose, why not every other? If revelation was needed, why was civilized learning necessary? And if it were superfluous perhaps it was positively evil? Burke's parody takes Rousseau's course: man's great error in association, the establishment of inequality by the ambitious, and the miseries it brought on everyone are all present. The pseudo-Bolingbroke was made to observe that 'the original Children of Earth lived with

their Brethren…in much Equality' and that the 'evils' of society were 'not accidental' for 'whoever will take pains to consider the Nature of Society, will find that they result directly from its Constitution' because 'as *Subordination*…is requisite to support these Societies', there result 'the worst and blackest Purposes'.[29] Whilst Burke was mistaken in thinking that Rousseau decried all society, as opposed merely to the course which modern society had taken, he was right in seeing that Rousseau's views were radically incompatible with his own. An answer was obviously required.

Rousseau's *Discourse* in effect embodied two claims about modern European society. One was that its hierarchical form implied a perversion of man's moral feeling. That feeling, which by nature took the form of compassion, the regard for those less fortunate than ourselves, would be stifled by the regard for those above us engendered in the social order. The compassion which man had by nature would be lost in the emulation he assumed in society. Rousseau's second claim was that a society so constituted, because unnatural, produced a range of economic and social miseries. Both claims condemned social inequality in the name of nature.

A mere denial of all this would not do. Burke could not be unimpressed by Rousseau's case, disagreeable though it was. After all his own view that the rich ought to work for the common benefit sprang from the common assumption that property existed for that end. With Locke, for instance, property existed to increase the fruits of the earth so that it could support people, just as political authority did not exist for the benefit of kings alone. 'Our modern Systems hold, that the Riches and Power of Kings are by no means their Property, but a Depositum in their Hands, for the Use of the People', Burke wrote, adding, 'And if we consider the natural Equality of Mankind, we shall believe the same of the Estates of Gentlemen, bestowed on them at the first distribution of Properties, for prompting the Public Good'. But that, in fact, was just what 'Gentlemen' in Ireland had omitted. Despite Burke's hopes, instead of making the people happy they seemed rather to have impoverished them. So much was this so that civilization wore a strange countenance, for 'it is no uncommon Sight [Burke wrote] to see half a dozen Children run quite naked out of a Cabin, scarcely distinguishable from a Dunghill, to the great Disgrace of our Country with Foreigners, who', Burke thought, 'would doubtless report them Savages'. Here, at the least, was a disturbing resonance in Rousseau's paradox of the misery of civil society. Indeed the indifference of the gentry seemed to bear out his psychological analysis. Burke asked,

> Is it not natural for a Man, who rides in his Coach on a bitter Day, or lies on his Velvet Couch, secured from all the Inclemencies of the Weather, to reflect with Pity on those who suffer Calamities equal to his Enjoyments?

but their indifference seemed to say it was natural no longer.[30]

A *Philosophical Enquiry* showed how nature gave rise to inequality. Burke did not dispute the standard view that men were by nature equal, though he did little to illuminate it. He indicated instead how passions that were entirely natural would give rise to a graduated social order. For Burke divided the passions which 'served the great chain of society' under three heads—sympathy, imitation and ambition. These linked men in society and linked them so as to make inequality natural. Sympathy was a 'bond' which

made men never 'indifferent spectators of almost anything which men can do or suffer'. Sympathy by itself did not make for inequality, but it concurred with the passions which did. 'For as sympathy makes us take a concern in whatever men feel', Burke wrote, so imitation 'prompts us to copy whatever they do'; and imitation was complemented by ambition, which gave 'a satisfaction arising from the contemplation of excelling his fellows' to a person.[31] So it was natural for the ambitious to lead and for the imitative to follow. Hence inequality in society would be established. The bonds of civil society were the causes of inequality: and inequality arose from nature.

An unequal society in Burke's view was not only natural but also progressive. If men were devoted to imitation alone, 'it is easy to see that there never could be any improvement amongst them' and it was 'to prevent this' that God instilled ambition into man.[32] 'Improvement' implies human artifice, and Burke was quick to show how human invention lay in the pattern of nature. Nature could extend to artifice and to a specific form of artifice. For 'nature' in Burke's hands included the best adaptation of the artificial to the ends that man's nature suggested. The content of 'nature' would be presented to best advantage not in a primitive condition, as Rousseau had seemed to suggest, but in the perfection of artifice. 'Art is man's nature', Burke wrote, because 'man is by nature reasonable; and he is never perfectly in his natural state, but when he is placed where reason may be best cultivated'.[34] At one level this view enlarged upon the view that man required society to flourish, for 'without which civil society man could not by any possibility arrive at the perfection of which his nature is capable, nor even make a remote and faint approach to it'.[33] At another, it authorized the distinct version of civil society Burke intended. For the author of *A Philosophical Enquiry* believed that society could produce 'a true natural aristocracy'. Nature culminated in artifice. In Burke's own words, 'the state of civil society, which necessarily generates this aristocracy, is a state of nature'.[34]

Thus, Burke found no reason to think that modern society necessarily involved moral perversion. He wrote of humanity, without deliberation, that 'we love these beings and have a Sympathy with them'.[35] But did society involve the misery of man? We may assume that social inequality could involve an unequal distribution of benefits. But the point is less a state of affairs than how it is considered. We have seen that Burke could be scarcely more restrained about contemporary conditions than Rousseau: but he viewed society in a different light. He would argue that society depended for its prosperity on inequality: so that to undermine the latter was to strike at whatever benefits the poor might receive.[36]

We have seen that for Burke the divine worked through inequality. Revelation was an unequal mode of distributing information. It involved a further inequality, because God issued it, who was man's superior: and this superior directed man through his passions. 'Religion' showed that God was also the author of a morality discoverable by reason, just as *A Philosophical Enquiry* had emphasized the passions which tended to establish a social inequality.

We need not suppose that Burke's general stance implies an indiscriminate approval of all graduated dispensations. He could say that 'all who administer in the government of men…stand in the person of God himself':[37] but this scarcely implies that those who were like God in power were like Him also in goodness. To put the matter another way,

some modes on inequality might be better than others. In order to distinguish which, Burke's focus had to move from the general to the particular. Most of his writings after *A Philosophical Enquiry* assess individual regimes. He turned first from his native Ireland in his *Abridgement of English History*.

When the undergraduate Burke discussed the possibilities of wealth for good, he had not forgotten power. In fact he thought that power might be more important for good than wealth. Power too required vindication, for among the inversions Burke attributed to the pseudo-Bolingbroke was the claim that any government, in its nature, was an instrument of evil. For just as Rousseau had told a story in which man was corrupted by society, Bolingbroke's account of history suggested that the liberty found amongst the Saxons in England was subsequently under threat from government and that one of its other enemies was the church.

The accounts of Rousseau and Bolingbroke in their different ways suggested that the motif of European and English history was decline, whether in the loss of virtue through society or in the problems of liberty after the Saxons. A writer offering an antidote might prefer to place his accent on progress. Where Bolingbroke's account questioned whether English liberties had grown since the Saxons and implied with a deistic sneer that the church was against political liberty,[38] an alternative would suggest that liberty had grown, not diminished, and that the church had assisted it. Since Bolingbroke argued that the early Middle Ages had seen a virtual extinction of political liberty, it would also be fitting to suggest that it was then that it was established.

Burke's *Abridgement* did not suggest the direct intervention of God, save at one point, but showed how desirable results occurred gradually without any human having insight into His plans. By the same token the results did not reflect deliberate human activity. Burke emphasized the themes of inequality, improvement and liberty. Fundamentally, he thought, the structure of Saxon and Norman society was sound in that it reflected nature by instancing inequality. Further, whether under the indistinct forms of Saxon society or under the feudalism of the Normans, the subordination of one man to another, reaching to the king, was uncoerced. Therefore kings felt sufficiently secure, on the whole, to govern through laws rather than by force.

These monarchs, too, favoured Christianity, which secured the benefits of improvement. Literacy and good manners were nurtured. So Burke could see the Middle Ages as the period in which the bearers of religious and social inequality secured blessings to England. These reflections formed the basis of Burke's view of how government by opinion arose. Government by force ceased to be necessary when the ruler and the ruled could trust each other. This happened under the feudal system, which embodied the loyalty of subject to sovereign and which Burke would describe eventually as 'the old feudal and chivalrous spirit of *Fealty,* which by freeing kings from fear, freed both kings and subjects from the precautions of tyranny'.[39] Under this condition force would be replaced by opinion as a mode of government. This feudalism both necessitated and provided. It was necessary because leaders were followed freely (the sovereign 'was only a greater lord among great lords')[40] and supplied by the code of honour feudalism embodied ('the soft collar of social esteem').[41]

Improvement flourished under the same conditions. Burke thought that 'the rudeness of the world was very favourable for the establishment of an empire of opinion' and the

body most fitted to form opinion was the Church. As 'the asylum of what learning had escaped the general desolation'[42] she imparted knowledge to the world. Hence the 'ground-work' of intellectual improvement was a 'Gothic and monkish education', because the Church had been the agent 'preserving the accessions of science and literature, as the order of Providence should successively produce them'.[43] Thus the agents of revelation complemented the beneficiaries of social hierarchy in God's design.

This story was common to Europe and England, for both had been feudal, but there was one feature peculiar to England. Political liberty arose through the coincidence of the growth of order, the church, and the precise structure of Norman society. Executive government extended its power. But it was balanced when the aristocracy was encouraged by the church to resist. Since the aristocracy was not sufficiently strong on its own to prevail, it sought to enlist popular support by claiming liberty for all. In this fashion it was ensured that liberty was not merely won but won on a general basis.[44] We could perhaps say that because Burke's story gives out at *Magna Carta* it is that unclear what would happen next; and that his story concerned chiefly England. But a passage in *Reflections* made it clear that to his mind the civilization and manners of modern Europe as a whole were the children of church and hierarchy:

> Nothing is more certain, than that our manners, our civilization, and all the good things which are connected with manners, and with civilization, have… depended for ages upon two principles; and were indeed the result of both combined; I mean the spirit of a gentleman, and the spirit of religion.[45]

Inequality in society, in short, was the bearer of the fruits of civilization.

Thus Burke's view of the social order began not merely from a position opposed to Rousseau's, but also developed in a diametrically different direction. Where for Rousseau inequality in society was unnatural, it was natural for Burke; where history showed a declension for one, for the other it showed a providential improvement. Rousseau was not the only piece of grit in the Burkean oyster: but neither was he insignificant. At any rate, whatever the causation, the result was two irreconcilable theories of the social order.

IV

It would be wrong to present Burke as an uncritical admirer of contemporary institutions. His middle life (let us say 1760 to 1789) was preoccupied with the abuses of English government and politics, whether at home or in the colonies. Neither did he suppose that the European order was without serious defects.[46] But essentially these were criticisms of policy and a recognition of problems rather than a call for wholesale reconstruction. Burke's view that inequality was the pattern of nature suggested that the hierarchical social order he contemplated had within it the fundamental ingredients of rightness.

Rousseau's attitude, of course, was quite different. To insist that inequality was a moral perversion in the context of an hierarchically constructed society was a radical criticism. Rousseau proposed quite a different standard.[47] It has come down to us as *The Social Contract*.[48] This embraced two central items, the general will and the means

establishing it institutionally. Both of these transcended inequality. The general will implied an equality of treatment for all citizens *ceteris paribus* and Rousseau's means of instantiating it excluded the dependence of one person on another.

The concept of the general will has a transparent meaning and an unusual institutional form. By 'general will' Rousseau meant a measure which 'tends always to the preservation and welfare of the whole and of every part'.[49] More specifically he had in mind a measure implying the same treatment for all members of a community. In his own words, each person 'submits…to the conditions he imposes on others'.[50] This, no doubt, explains why Rousseau referred to it as justice,[51] for justice implies that each person be treated in the same manner as the next, unless there is some reason in their nature or circumstances that requires a difference should be made. In the words of his *Letters from the Mountain* under the general will 'all want conditions to be equal for all, and justice is only this equality'.[52]

The general will stood in contrast with the particular will. Where the general will prescribed an identical treatment for all persons under consideration, the particular preferred the interests of one agent alone. Rousseau assumed that each agent would seek his or her own advantage, writing of 'the individual's own will, which tends only to his particular advantage'.[53] To illustrate the difference very simply, suppose one were faced with the task of distributing 200 sweets amongst 100 persons (including oneself). The solution fitting the particular will would be to allot all 200 to oneself and none to the others, whilst that matching the general will would distribute two sweets to each person in the group.

Rousseau, in effect, proposed that each individual should regard himself or herself in precisely the same manner as others, other things being equal. This principle that one should pay a significant regard to others is embodied deeply in almost all European moral thinking. Those who hold a different view, such as Nietzsche, are in defiant isolation. It appears as a form close to Rousseau's in the Christian precept to 'love they neighbour as thyself'.[54] Whilst in Rousseau's time this principle would have found general acceptance, most would have restricted its application. No one would have doubted that some principle of this kind applied to moral conduct. Rousseau, in a like mood, conceived that acting according to the general will was virtuous:[55] but it was his application of the concept to politics that was striking.

For Rousseau meant to transpose his attitude to inequality from a critical to a constructive key. He had diagnosed inequality as a central constituent in the malaise of modern society. He meant to show how a rather better society could be constructed, one which avoided what he took to be the core of inequality, namely undue distinctions between persons and the dependence of one person upon another. That is to say, Rousseau sought a situation in which people would be treated in an identical manner and one in which personal dependence was not possible. Let us look first at identity of treatment.

Beginning with matters of institutional form, we find that the political body that Rousseau conceived to bear the general will had an unusual character. To understand that character we should adduce the requirements for fulfilling the general will. If we take it that each person should be treated in the same manner as the next, *ceteris paribus,* and wish to move to Rousseau's position that people *are* to be treated in the same manner, we

must fill out the *ceteris paribus* clause in a way that admits of no difference amongst the people under consideration. This implies, amongst other things, that they must be juridically equal. How as Rousseau to satisfy this condition? He thought that people were not equal in terms of strength and other natural endowments, and was painfully aware that they did not all have the same status in modern society. Neither of these could provide the means of satisfying Rousseau's requirements. Hence people would have to *acquire* equality of standing.

This acquisition was provided for through Rousseau's conception of the political body. Rousseau supposed that people would *place* themselves upon a footing of equality. This was achieved by each agent totally alienating his person and his rights. A *total* renunciation was necessary, for prior to it people were unequal in various ways and to reserve something might perpetuate that condition. Hence the foundation of a body capable of bearing the general will was 'the total alienation of each associate and all his rights', 'for…each giving himself entirely, the condition is the same for all'.[56] That is to say, people set themselves all on the same footing.

But to what did they alienate themselves and their rights? It may sound as if people created a body, rather like Hobbes's, which was endowed with all of their attributes. So it was, but the crucial question was the composition of this body. With Hobbes the sovereign was juridically distinct from the agents that created it: they transferred rights to it. With Rousseau the sovereign body was composed of those who created it.[57] They alienated their persons and rights to a body whose members they became. Indeed it is in precisely this act that we can locate their equal standing: people placed themselves on the same footing *as* members of the body, as citizens. To put the matter another way, Rousseau conceived people as equal because he identified sovereignty with citizenship. This may seem an excessively simple move, but great intellectual innovation is often distinguished by a masterly simplicity.

Thus people obtained an equal status. But we may ask how they were able to do so? Rousseau assumed that nature did not imply the subordination of one to another. His account here, as in his second discourse, transformed the resources of preceding speculation, this time those of absolutism. Neither parentage nor force provided a title to direct others, he thought, thus bypassing Filmer and Hobbes respectively.[58] On the contrary, the make of nature suggested that each agent was concerned for self-preservation and therefore that it was appropriate to exercise his or her capacity for self-direction, including free will. Of course, the quest for self-protection might be supposed to lead to subordinating oneself to another person without reservation. Grotius (amongst others) had -conceived this. Rousseau rejected the suggestion, like Locke before him, but for a different reason. Where Locke had supposed that people were bound to do God's will, Rousseau argued that to be free was integral to being a moral agent and therefore freedom could not be surrendered.[59] At any rate, it is evident that people would be free to create a body politic.

Rousseau's suggestion that freedom could not be surrendered raises questions about the advantages of his political exercise. Did not setting up a sovereign involve a total surrender of person and rights? It did, but the process produced corresponding advantages, including a freedom more extensive than the one enjoyed previously.

Rousseau continued to argue through self-preservation. He supposed that people's

chief means to this goal lay with their force and their freedom. Agreeing with preceding thought for once, Rousseau saw co-operation as a means of increasing the force on which each individual could call. But what of liberty? Rousseau indicated that the question was how to reconcile the advantages of co-operation with the continuance of self-direction. His answer was that in his political body the latter would continue through what he termed conventional liberty, notwithstanding that natural liberty would be surrendered.[60]

This requires some explanation. Had each agent not surrendered his or her means of independence to the sovereign? They had; and freedom in the sense of independence, therefore, was gone. But in a body answering to the general will there arose conventional or civil liberty. This was a condition in which no agent was dependent on another. For the direction of such a community came from rules that accorded with the general will: that is to say from rules treating each person's interests with the same consideration as the next's. It follows that under this scheme of justice or equal dealing no agent's liberty would be defined in a way that conflicted with another's or with another's interests. But why should liberty on this model be an advantageous exchange for the independence given to people by their natural powers? The answer is that Rousseau supposed that people by nature were entitled to whatever they could get. This neo-Hobbesian supposition, it scarcely needs saying, rather suggests that in this condition life would not be very tolerable and it was rational to institute political order—a point Rousseau himself made.[61] Hence it was worthwhile to exchange an insecure independence for a protected liberty. Rousseau suggested in his *Letters from the Mountain* that it was misleading to 'confuse independence and liberty. These two things are so different that they exclude each other', he continued: that was to say that, 'liberty consists less in doing one's own will than in not being subject to another's' and that 'in the shared liberty no one has a right to do what the liberty of another forbids him to do'. Hence liberty implied the presence of the general will, 'liberty without justice is a veritable contradiction'.[62] Civil liberty meant a liberty prescribed by the measure of justice contained in the general will.

In Rousseau's political body the possibility of personal dependence was removed. For man became more fully master of himself in a political condition. In the first place he was released from direction by his appetites. For though not directed by another people, natural man was dependent on nature, being moved by appetites and instincts. Another direction succeeded, for, in the second place, though no longer independent, he was dependent on laws prescribed by the general will. Third, to depend on such laws was preferable to depending on other people. Rousseau believed that dependence on persons was dangerous. For it was not regulated by any moral norm and so admitted vagaries of conduct. As he put the matter in *Emile:*

> There are two kinds of dependence: dependence on things, which belongs to nature; dependence of men, which belongs to society. Dependence on things, having no morality, is not harmful to freedom and does not engender vices; dependence on men, being uncontrolled, engenders them all, and it is through this dependence that master and slave become mutually depraved. If there is some means of curing this evil in society, it is through substituting law for men,

and more precisely by substituting laws founded on the general will.[63] Fourth, direction

by the general will to Rousseau's mind meant direction by self-legislated measures. Thus, guided by the general will the agent was directed by morality and by himself, rather than by nature and by other people. As master of himself in this way, he was genuinely free.

Much else could be said about *The Social Contract* which only considerations of space prevent. But one matter requires attention. That is Rousseau's civil religion. This cult would propound a doctrine which, without prejudicing other beliefs consistent with it, was meant to reinforce the political body by teaching congruent with the activity and the regard for others implied in the general will. This was to be contrasted with Christian doctrine, which for Rousseau preached patience and indifference to the world, as well as drawing people's allegiance away from their proper loyalty to the state.[64] If Rousseau had studied Burke as Burke had studied him he would have discovered that Christian belief might match the sort of unequal order that *The Social Contract* was meant to supersede.

V

Burke's views had dwelt on inequality in manifold forms. He had begun by emphasizing the importance of revelation, which was a message distributed unevenly. He had developed a view of man which stated that the inequality between leaders and followers was natural. Social hierarchy, property and government too stood on an unequal basis. The bearers of social and religious inequality, aristocracy and church, had achieved liberty and improvement for England in the Middle Ages. After nearly twenty-five years in Parliament Burke held that good government was still secured by some of the bearers of inequality. So when the French Revolution came it touched a live nerve. For Burke a movement which made *égalité* its watchword implied the destruction of the conditions on which society existed and prospered. To his mind it would involve not merely the destruction of legal privilege but the destruction of inequality in society and everything which went with it.

Burke believed that 'the true actuating spirit' of 'the whole' of the initial policies of the Revolution belonged to 'a cabal'. The character of the cabal, that it had the pretension of 'calling itself philosophic',[65] is a hint to what he thought he saw was the spirit of the revolutionaries, namely that they were deists or, as Burke preferred to insinuate, atheists:

> It is not with you composed of those men, is it? whom the vulgar, in their blunt, homely style, commonly call Atheists and Infidels? If it be, I admit that we too have had writers of that description, who made some noise in their day. At present they repose in lasting oblivion. Who, born within the last forty years, has read one word of Colins, and Toland, and Tindal, and Chubb, and Morgan, and that whole race who called themselves Freethinkers? Who now reads Bolingbroke? Who ever read him through?

The destruction of inequality would be a congenial task for the enemies of revelation to Burke's way of thinking.

To whom did Burke suppose the revolutionaries looked for inspiration, apart from

deism? They were alleged to have taken for their 'canon of holy writ', 'standard figure of perfection' and 'pattern' Rousseau.[65] In Rousseau Burke had early found a great challenge to social inequality and to society itself.

The forces Burke had conceived early in life as the enemies of revealed religion and civil society respectively were now combined. Deism had no use for revealed theology. The civil society which Burke recognized revealed theology to need in order to perfect man's condition was the object of Rousseau's enmity. So Rousseau and the deists appeared to him as alike parts of a pattern of rejection of God's will. With God's will went the order of modern Europe which embodied the conditions on which progressive civilization was to be had. In other words revealed theology and social inequality or, as Burke said, 'the spirit of religion' and 'the spirit of a gentleman', stood or fell together.

R*eflections on the Revolution in France* divides into two parts, arranged in dramatic contrast with one another. The first contains an account of a properly regulated society, interwoven with a description of the attack upon it. It displays a providential order. The succeeding part provides a sharp contrast, dwelling on the results of working by human foresight alone—inadequacy. The inadequate nature of the revolutionary institutions is underlined by an appreciation of British recognition of mankind's limitations and proper reliance on God. The divine order and its opposite stand in pointed contrast.

The French Revolution was the worst of nightmares for Burke. The programme he attributed to it implied the destruction of everything he thought valuable in society. Yet by the same token it was the greatest opportunity to expound his views. It had never before fallen to him to deploy his political opinions in concentrated form. Are those views eccentric? All interesting political theory makes connections others have overlooked. This prize is likely to fall to one whose stance is out of the ordinary. Burke's point of view, formed, we have seen, out of an amalgam of inequalities, was the fruit of a particular origin and experience. No doubt Burke's perspective is unusual, as is Rousseau's in a different way, but one of the objects of historical study is to explain how unusual doctrines are natural enough to their creators.

NOTES

1 Convenient but hard to translate into English. Whilst the latin *mores* is a good equivalent it has become a term of sociological art; *manners* has connotations of politeness; *morals* connotes ethical distinctions. *Moeurs* suggests something that is embodied in conduct and in institutions.
2 See [14.55] for a closely observed account of Hutcheson's ethics and the place of reason in them.

BIBLIOGRAPHY

Primary Works

(i) Rousseau

All Rousseau's works cited here will be found in

14.1 *Oeuvres Complètes de Jean-Jacques Rousseau,* ed. B.Gagnebin and M.Raymond, 4 vols, Paris, Bibliothèque de la Pleiade, 1959–69. The most important texts for our purposes are 14.2–14.8:

14.2 *Discours sur les sciences et les arts*

14.3 *Discours sur…l'inégalité*

14.4 *Discours sur l'économie politique*

14.5 *Du contrat social*

14.6 *Emile*

14.7 *Confessions*

14.8 *Lettres écrites de la montagne.* Helpful translations include.

14.9 *The Social Contract and Discourses,* trans. G.D.H.Cole, London, Dent, 1913. revised J. H.Brumfitt and J.C.Hall, London, 1973.

14.10 *First and Second Discourse,* trans. V.Gourevitch, New York, Harcourt Brace, 1986.

14.11 *The Social Contract,* trans. M.Cranston, Harmondsworth, Penguin, 1968. Other relevant texts by Rousseau include:

14.12 *Rousseau on International Affairs,* ed. S.Hoffman, and D.Fidler, Oxford, Oxford University Press, 1991.

14.13 *Religious Writings,* ed. R.Grimsley, Oxford, Oxford University Press, 1970.

14.14 *Reveries,* trans. P.France, Harmondsworth, Penguin, 1982.

14.15 *Lettre à D'Alembert,* trans. A.Bloom as Politics and the Arts, Glencoe, Free Press, 1960. His letters have been printed as

14.16 *Correspondence Complète,* ed. R.A.Leigh *et al.,* 50 vols, Geneva and Oxford, Institut et Musée Voltaire, the Voltaire Foundation, 1965–91.

(ii) Burke

14.17 *A Notebook of Edmund Burke,* ed. H.V.F.Somerset, Cambridge, Cambridge University Press, 1957.

14.18 *The Writings and Speeches of Edmund Burke,* ed. P.Langford, *et al.,* 5 vols so far, Oxford, Oxford University Press, 1981–. For works yet to appear in this edition, see

14.19 *Works,* 6 vols, Oxford, Oxford University Press, 1906–7. This includes 14.20–14.22:

14.20 *A Vindication of Natural Society*

14.21 *A Letter to a member of the National Assembly*

14.22 *An Appeal from the New to the Old Whigs*

14.23 *An Abridgement of English History.* Helpful editions include

14.24 Boulton, J.T. (ed.) *A Philosophical Enquiry into the Origin of our Ideas of the Sublime and Beautiful,* London, Routledge and Kegan Paul, 1958; 2nd edn, Oxford, Oxford University Press, 1986.

14.25 O'Brien, C.C. (ed.) *Reflections on the Revolution in France,* Harmondsworth, Penguin, 1968. Burke's early writings are printed in

14.26 Samuels, A.P. I. *The Early Life, Correspondence and Writings of…Edmund Burke,* Cambridge, Cambridge University Press, 1923. See also

14.27 Harris, I. (ed.) *Edmund Burke: Pre-Revolutionary Writings,* Cambridge, Cambridge University Press, 1993. Burke's letters are printed in
14.28 Copeland, T.W. *et al.* (eds) *The Correspondence of Edmund Burke,* 10 vols, Cambridge, Cambridge University Press, 1958–78.

Glossary

absolutism: (a) In political philosophy, an ‘ absolute’ government is one whose rule is subject to no (human) restraint, for instance by a parliament or a constitution, and answerable (if at all) only to God. Contrasted with ‘bounded’ government (q.v.). (b) Elsewhere ‘absolutism’ is contrasted with some form of ‘relativism’. For instance an absolutist about space will hold that it exists independently of matter.

a posteriori: what is knowable, if at all, through experience. Contrasted with ‘a priori’ (q.v.).

a priori: what is known, if at all, independently of experience. Contrasted with ‘a posteriori’ (q.v.).

bounded government: bounded government is government that is limited by human laws. Belief in bounded government is contrasted with ‘absolutism’ (q.v.).

Cabala: literally ‘tradition’, specifically an esoteric tradition of interpreting Scripture supposed to have been handed down in secret by Moses to certain select disciples and by them in turn. There was considerable Christian interest in the Cabala during the Renaissance and, though it was discouraged by the Catholic Reformation, this continued to be expressed by Neoplatonists in Protestant countries into the eighteenth century.

Calvinism: the theology of the French Protestant theologian John Calvin (1509–64) which was influential in England in the seventeenth century and in Scotland throughout the period covered by this volume. Calvin subscribed to an austere doctrine of predestination according to which the future salvation or damnation of any individual soul has been predetermined for all time. The Calvinistic emphasis on the corruption of human nature led to a stress on faith rather than fallible human reason. It was opposed by those who believed in natural theology or rational religion.

Cartesianism: the doctrines associated with the philosophy of René Descartes: especially, in the context of this volume, the belief that events in the natural world are determined by invariant mechanical laws. Descartes claimed to know a priori that the essence of matter consisted in extension and Cartesianism was associated with a physics that was partly a priori. Descartes’s radical separation of the material world from that of the mind and his endorsement of innate ideas encouraged some to interpret him as sympathetic to Christian Platonism.

cause: a cause has often been understood to mean that, in the presence of which some event *must* occur. If, however, this means that there would be a contradiction in supposing that the cause occurred but not its effect, it seems there are few causes in this sense. As the occasionalists (q.v.) recognized it was only in the case of God willing something to happen that there would be a contradiction (since God is by definition omnipotent) in supposing it not to happen. From this it seems as if a natural cause is nothing more than a phenomenon that is regularly found to be followed by

events of the kind in question. Empiricist (q.v.) accounts of causation stress this regularity or, in Hume's phrase, 'constant conjunction'.

certainty, moral: what is morally certain had the highest degree of probability and is certain for the purposes of practical life. It is distinguished from theoretical certainty or *scientia*. (q.v.)

common notions: these are notions that are universally imprinted on humans and make possible a universal consent to certain propositions. The existence of such notions was a matter of controversy during the period covered by this volume. See 'innate ideas'.

consensus gentium: a mode of argument for the truth of a proposition from the existence of universal consent to it. This mode of argument was attractive to those who believed in common notions (q.v.).

constructivism: opposed, for example to realism in mathematics, those who hold this view argue that truths are not so much discovered as constructed. This view was advocated by Vico. See Chapter 13.

contract, original: the obligation to obey the ruler was supposed by some theorists to be based upon a contract made at the founding of political society. In return for the promise of the people to obey the sovereign, the ruler undertook for his part to protect the people and their rights.

contradiction, principle of: every self-contradictory statement must be false and its denial must be true.

corpuscular philosophy: the view, associated with Gassendi, Boyle and Locke, that the world is made up of tiny particles of matter.

correspondence theory of truth: the theory that a proposition is true if, and only if, there is some (corresponding) state of affairs or set of facts in the objective world in virtue of which it is so.

deism: a point of view embracing belief in a Creator but hostile to revealed religion. Deists characteristically disbelieved in miracles and tended to be anti-clerical. Though they sometimes believed in a general Providence and even in a deity who punishes the wicked and rewards the virtuous, they did not regard the sacraments as necessary to salvation.

demonstration: a logical term for an argument whose conclusion follows from its premisses, i.e. where it would be inconsistent to accept the premisses and reject the conclusion. Demonstrations, so defined, have been admired as the strongest possible form of argument. Deductive logic is concerned with valid forms of demonstrative or deductive inference.

deontology: the science of duty, usually associated with the view that we are bound by certain absolute duties, which we can know, and which are not affected by circumstances.

design, argument from: an argument based upon the orderliness observed in nature which is intended to establish the existence of an intelligent and purposive cause of the natural world. This argument became very popular in the eighteenth century, though it was severely criticized in Hume's *Dialogues Concerning Natural Religion*.

determinism: the view that every event (including every human action) has a cause and that there is no chance in the universe. Determinists usually interpret the existence of a cause as meaning the event could not fail to occur and that human actions, when

caused, are not 'free'. Some determinists, however, have claimed not to deny free will and have maintained, on the contrary, that the absence of a cause of a human action would bring free will into question in a way that the presence of a cause does not.

divine right (of kings): an absolutist (q.v.) doctrine according to which kings are appointed by God and are not answerable to their people for their actions.

eclecticism: a term used of the tendency of some philosophers to take elements from several different sects or schools rather than adhere consistently to a single one. Eclectics are usually liberal and anti-sectarian.

egoism, ethical: the view that what I morally ought to do is to promote my own interests.

egoism, psychological: a theory according to which individuals are motivated to action only by concern for their own interests.

egoism, rational: the view that I only have good reason to do those actions which promote my own interests.

emanation: a characteristically Neoplatonic (q.v.) doctrine in which the world is conceived as a kind of over-flowing of the divine nature. Everything that is of the spirit, comes from the divine light, thus emanates from God. Evil is simply the privation of this and so is present in anything which is not pure divinity. Evil and good, darkness and light, matter and spirit, passivity and activity, are all treated in analogous ways. So the material world, though it is fundamentally spirit-like, was conceived as having fallen into a torpid state from which, according to some, it will eventually be restored to its true nature.

empiricism: the view that all our knowledge about the nature of things is derived from experience. Usually contrasted with rationalism (q.v.).

Enlightenment: the name given to a period in European history which was marked by an emphasis on reason and a distrust of mystery and authority. Though there were many connections across national boundaries, the circumstances of the intellectual élite in each country were different and so what may be true of the Enlightenment in one country may not be in another.

epistemology: theory of knowledge. Concern with the nature of human knowledge and its limitations became, as a result of Locke's *Essay,* a major concern of eighteenth-century philosophy.

fideism: from the Latin word for 'faith', this term is used to refer to the view that there is no basis in reason for religion and that its basis can only be that of faith.

final cause: that for the sake of which something is done. In that sense the final cause or 'end' of taking exercise may be health. The term goes back to Aristotle. According to the mechanical philosophy final causes were not to be used in physics.

form, substantial: a scholastic (q.v.) term deriving ultimately from Aristotle. The substantial form of a thing is what makes it the kind of thing it is. Anychange in the state of a thing which is not caused externally is referred to its substantial form.

general will: a term of French social thought, signifying the collective will of society or the will of an individual insofar as that person is public-spirited. The term is probably theological in origin, deriving from a contrast between God's general will (which results, for example in the laws of nature) and His particular wills (on specified occasions, for example in performing a miracle). As applied to individual humans a general will contrasts with a self-regarding 'particular will'.

gnoseology: another term for epistemology (q.v.).

hedonism: the view that pleasure is the greatest good.

hedonism, psychological: a theory according to which human beings are primarily motivated by the prospect of their own pleasure.

humanism (Renaissance): the movement is associated with the *stadia humanitatis* and with promoting the 'humanities' through the recovery and establishment of the classical texts—particularly of ancient Roman but also of Greek authors. The humanities, so understood, included grammar, rhetoric, poetics, moral philosophy and history. Humanists were opposed to the scholastic curricula which predominated in universities until the end of the seventeenth century. But their ideas influenced the education of the aristocratic laity and remained influential throughout our period.

humanism (Erasmian): usually associated with the project of applying humanistic disciplines to the texts of the Bible. This was opposed, on the one hand, to the authoritarian view that the Bible meant what the Church determined that it meant and, on the other hand, to the subjective interpretations of 'enthusiasts'. Erasmian humanism may be seen as paving the way for the more rational approaches to religion that emerged in the seventeenth century.

idea: the term originates with Plato for whom the ideas or forms constituted a transcendent realm of archetypes. Christian Platonists located these ideas in the mind of God. Descartes extended this use to allow that the human mind is also furnished with 'ideas' and the use of the term to refer to what is before our minds when we think, imagine, dream, etc., became established in the writings of later philosophers, such as Locke and Berkeley.

idealist: originally contrasted with 'materialist' and used of philosophers such as Plato, the term is readily applicable to philosophers like Berkeley who denied the existence of 'matter' and who affirmed that the sensible world was dependent on (the divine) mind. It was not until after Kant that 'idealist' came to be contrasted with 'realist' and to be associated with the view that the physical world is in some way the product of (the human) mind.

indiscernibles, identity of: a principle of Leibniz's, that there are no two things in the universe that differ only numerically, hence if A and B are exactly alike then A is identical with B.Leibniz inferred this principle from the principle of sufficient reason (q.v.) since God could have no reason to create A and B as separate individuals.

induction: a process of arguing from particulars to an a posteriori (q.v.) conclusion, characteristically a statement about the future, a generalization or a claim about an unobserved member of a class.

innate ideas: these are ideas (such as the idea of God) with which human beings were supposed to have been born and in virtue of which they are able to have a priori knowledge of how things are. Locke's *Essay* played an important part in bringing innate ideas into disfavour during the eighteenth century and in encouraging explanations of ideas in terms of origins in sense experience.

intuition/intuitive knowledge: commonly regarded as the highest form of knowledge by seventeenth-century philosophers, intuitive knowledge involves a total understanding of why something that is so, has to be so. This kind of knowledge, rare in humans, was thought to be characteristic of God's knowledge of the world. See also under *scientia*.

materialism: the view that, the basic metaphysical entities of the universe are material and that there is no independent world of mind or spirit. Hobbes and Spinoza were read as materialists, Locke was suspected of it and a number of the French *philosophes* openly advocated materialism.

mechanical philosophy: the view that all the interactions in the physical universe are to be understood as like the interactions of parts of a mechanism such as a clock. Advocates of the mechanical philosophy rejected explanations in terms of 'occult qualities' (q.v.) or unintelligible 'influences'. Their rejection of action 'at a distance' led the mechanical philosophers to develop their own theories of gravitation, magnetic attraction, etc. They also rejected the use of final causes in physics.

metaphysics: as used in this volume, the supposed a priori (q.v.) science of what really exists. Metaphysics goes beyond what can be discovered by the empirical sciences. It purports to demonstrate, for instance, the immortality of the soul or the existence of God and perhaps even the nature of a 'hidden' world beyond the world of phenomena. What is generally called 'rationalism' (q.v.) by philosophers is favourable to metaphysics, whereas empiricism (q.v.) is generally ami-metaphysical.

microcosm/macrocosm: the view that Man is a microcosm of the Cosmos (the macrocosm) was quite widely held in the sixteenth century and persisted through the seventeenth. It is associated with Renaissance Neoplatonism (q.v.) and had a range of applications from design to medicine. In a scientific context it assumed interactions that were excluded by the mechanical philosophy (q.v.).

monad: Neoplatonic term for 'one'. In the seventeenth century some Neoplatonists used the term 'monad' to describe the equivalent in their system of atoms in materialistic systems. Their monads were, however, never merely material and were sometimes conceived of (for example by Leibniz) as essentially non-extended, albeit always having some connection to matter.

moral sense (theory): the view that the ability of human beings to distinguish right from wrong depends, not on their reason, but on the fact that they are disposed to find certain actions (and characters) pleasing and others displeasing.

naturalism: a word with a wide range of variously related meanings but used in this volume (in connection with Hume) to refer to the view that our beliefs are arrived at by natural processes rather than by the operation of abstract Reason.

natural law: a moral code, laid down by God but based on created human nature, for instance on the urge for self preservation and the need to live in society. Natural law was supposed to be known through human reason.

Neoplatonism: this term is used in the first place of the revival of an eclectic Platonism between the third and sixth centuries AD. The most important figure of this movement was Plotinus. During the Renaissance there was a revival of this Neoplatonism when Ficino produced Latin editions from Plato, Plotinus and others. See Vol. IV in this series, pp. 25–36.

occasionalism: a theory according to which God is the only true cause, hence that the apparent causes of the changes in the world should be regarded as no more than 'occasions' for God's acting to bring the changes about. On this view we should not say, strictly speaking, that striking a match is the cause of its lighting but that it is the 'occasion' on which God causes the match to light. See Vol. IV in this series, Ch. 10.

occult qualities: scholastic philosophers regarded certain qualities such as attraction as 'occult'. Adherents of the mechanical philosophy sought to do away with such 'occult qualities' and the phrase became, for them, a term of abuse.

ontological argument: one kind of argument for the existence of God, according to a classification that derives from Kant. Such arguments begin with a premiss about the nature or essence of God or definition of 'God' and seek to demonstrate that such a being must exist. Some of these arguments are still found impressive, as they were by Descartes, Spinoza and Leibniz. Such a priori arguments were not in favour in the eighteenth century, however, when the argument from design (q.v.) became the main argument used to support belief in God.

parsimony, principle of: the principle that, other things being equal, simpler hypotheses should be preferred to more complex ones.

peripatetics: Aristotle was reputed to have walked around whilst lecturing and the term 'peripatetics' (literally, 'those who walk round and round') came to be used in an uncomplimentary way of his followers, eventually of the scholastics (q.v.).

philosophe: French word for 'philosopher' but used especially of the intellectual figures of the French Enlightenment.

philosophia perennis: literally 'perennial philosophy'. It is a reference to that body of ancient wisdom in which Renaissance philosophers believed and which they sought to revive. See also under *prisca theologia*.

pietism: a devotional movement within the Lutheran Church in Germany. Founded by P.J.Spener (1635–1705), pietism encouraged Bible Study and advocated love rather than argument in dealing with dissenters and unbelievers.

positivism: the view that there is no knowledge to be obtained of the nature of things except by following the methods of the natural sciences.

predestinarianism: the theological theory that each individual's capacity for good or ill (and destiny of salvation or damnation) is totally dependent upon a divine grace whose distribution has been determined for all eternity. This theory is part and parcel of the Calvinist (q.v.) view of human nature as wholly 'fallen' and corrupt. It was opposed by those who thought human nature was basically good, as for instance did the Cambridge Platonists.

pre-established harmony: Leibniz, like the occasionalists, rejected the idea of an external causal action by one substance on another. He proposed instead that each substance had been so designed from the Creation that everything that would happen to it would emerge spontaneously from its own 'nature' but in perfect harmony with what was taking place in other substances. Leibniz himself referred to his proposal as a 'hypothesis' or, more commonly, as his 'system' of 'pre-established harmony'.

premiss: a logical term for a proposition put forward at the beginning of an argument, particularly in a formal demonstration (q.v.).

prisca theologia: literally 'ancient theology'. Renaissance Neoplatonists such as Ficino sought to recover the wisdom of ancient sages such as Hermes Trismegistus (a legendary Egyptian priest), Zoroaster and Orpheus. They assumed that the thoughts of the ancient theologians were harmonious with one another and with both Platonism and Christianity.

qualities, primary and secondary: an old distinction certain seventeenth-century

philosophers took over in order to separate those qualities of bodies that were essential from those that were not. The exact formulation of the distinction varied and was controversial. Locke, for instance, characterized primary qualities (like shape) as ones which produced ideas in us that resembled their causes as they are in bodies. In the case of secondary qualities (like colour), on the other hand, there is no resemblance between the ideas they produce in us and their causes in bodies. For Locke these qualities are all powers in bodies, whereas Berkeley offered a radically different account of qualities which rejected such powers and material bodies (so understood).

rationalism: a term used in a number of senses, for instance to signify opposition to any reliance on mystery or the arbitrary will of God in religion. Its main use in this volume is for the view, as opposed to empiricism (q.v.), that true certainty is grounded in reason ('intuition', q.v.) and that we can have a priori knowledge of the nature of things, of our duties, etc. See Introduction.

realism, moral: a theory in ethics according to which there are distinctively moral facts.

relativism: (a) in ethics, the view that there are no absolute moral standards but that these vary from one society to another, (b) about space and time, that they are nothing ('absolute') in themselves, but ways in which phenomena and events are ordered.

scepticism: most generally the view that knowledge of any sort is unobtainable. Commonly used for the view that knowledge of an objective world is unobtainable.

scepticism (moral): strictly the view that we have no knowledge of objective moral truth but often also for the view that there is no objective moral truth, in the sense of moral realism (q.v.), and that moral distinctions are conventional or subjective.

scholasticism: the style of philosophy associated with the Church schools and universities of the medieval period. The status according to Aristotle by the scholastics is indicated by their referring to him simply as 'the philosopher'. But, although they operated within a broadly Aristotelian framework, the scholastics elaborated a technical vocabulary of their own. The humanists attacked the 'barbarity' and the Moderns the 'obscurity' of this language. Scholasticism lost its dominance in universities around the end of the seventeenth century.

scientia: the term means 'knowledge' but is used to refer to an Aristotelian ideal of knowledge widely shared by philosophers in the seventeenth century. According to this view *scientia* is of 'that which is necessary' and 'cannot be otherwise'. Ultimately knowledge depends upon 'intuition' (q.v.), on this view, but demonstration (q.v.) was seen as the key process for arriving at new knowledge.

sensationalism: the view that all human knowledge derives from the senses.

sentimentalism: an ethical theory according to which moral distinctions are discerned not by reason but by feeling or sentiment.

Stoicism: one of the ancient Greek Schools of philosophy which spread to Rome, where it was adopted by Cicero and other figures who were widely admired during the seventeenth and eighteenth centuries. Stoics tended to pantheism, believing that events in the natural world are part of an interconnected whole. Though it was sometimes liberally interpreted as a Christian philosophy the Stoic virtue of steadfastness in the face of necessity did not sit easily with belief in a personal providence or in a God who acts freely. At the same time philosophers with a tendency to deism (q.v.) were not necessarily deterred from accepting Stoic ideas by such a consideration.

subjectivism: in ethics, the view that a moral judgement does no more than express the speaker's feelings, for example of approval.

sufficient reason, principle of: a favourite principle of Leibniz's, admitting of many formulations, including: for every statement that is true there is a sufficient reason (though not always know to us) why it is true. Leibniz denied that there could be any two things in the universe that were exactly alike since God would not have a sufficient reason to create both of them.

system: a theory such as the Copernican theory but also a speculative a priori metaphysical theory. It is in the latter sense that the term 'system' was often used during the Enlightenment in a disparaging way, especially by Condillac.

utilitarianism: a view according to which the rightness or wrongness of an action was to be decided by reference to question whether its consequences were beneficial or harmful. The term was first adopted by J.S.Mill in the nineteenth century but utilitarian thinking had become more common during the eighteenth century. Earlier theological utilitarians had credited God with a commitment to securing the greatest amount of human happiness possible in the long term. But utilitarian thinking in Hume, Helvétius, Bentham and others was distinctly secular and often anti-religious.

verstehen: a cognitive empathy or imaginative understanding peculiar to human understanding of personal activities, for example of motives, etc. This view is associated with the rejection of attempts to model the human on the natural sciences.

voluntarism (theological): any of several views that stress the will of God, among them (a) the view (endorsed, for instance by Descartes) that the so-called 'eternal truths' depend for their truth upon the will of God, who could have willed that they are false. On this view the natural order is good simply because God created it. God did not create the world the way He did in conformity with some standard of goodness that is independent of His will: (b) the view (held by Berkeley among others) that the continuing existence of the sensible world depends on God's continuing causation and that the constancy of the laws of nature are dependent on the constancy of the divine will.

The Age of German Idealism

Also available as a printed book
see title verso for ISBN details

Routledge History of Philosophy
Volume VI

The turn of the nineteenth century marked a rich and exciting explosion of philosophical energy and talent. The enormity of the revolution set off in philosophy by Immanuel Kant was comparable, by Kant's own estimation, with the Copernican Revolution that ended the middle ages. The movement he set in motion, the fast-moving and often cantankerous dialectic of "German Idealism," inspired some of the most creative philosophers in modern times: including G.W.F.Hegel and Arthur Schopenhauer as well as those who reacted against them—Marx and Kierkegaard, for example.

This volume traces the emergence of German Idealism from Kant and his predecessors through the first half of the nineteenth century, ending with the "irrationalism" of Kierkegaard. Each chapter has been written by a distinguished scholar in the field, and contributors include Lewis White Beck (on the German background), Daniel Bonevac, Don Becker, Patrick Gardiner (on Kant), Daniel Breazeale (on Fichte and Schelling), Robert C.Solomon, Willem deVries and Leo Rauch (on Hegel), Kathleen M.Higgins (on Schopenhauer), Robert Nola (on the Young Hegelians, including Marx) and Judith Butler (on Kierkegaard).

The Age of German Idealism provides a broad, scholarly introduction to the period for students of philosophy and related disciplines, as well as some original interpretations of these authors. It includes a glossary of technical terms and a chronological table of philosophical, scientific and other important cultural events.

Robert C.Solomon is Quincey Lee Centennial Professor of Philosophy at the University of Texas at Austin. **Kathleen M.Higgins** is Associate Professor of Philosophy at the University of Texas at Austin.

Routledge History of Philosophy
General editors—G.H.R.Parkinson and S.G.Shanker

The *Routledge History of Philosophy* provides a chronological survey of the history of Western philosophy, from its beginnings in the sixth century BC to the present time. It discusses all major philosophical developments in depth. Most space is allocated to those individuals who, by common consent, are regarded as great philosophers. But lesser figures have not been neglected, and together the ten volumes of the *History* include basic and critical information about every significant philosopher of the past and present. These philosophers are clearly situated within the cultural and, in particular, the scientific context of their time.

The *History* is intended not only for the specialist, but also for the student and the general reader. Each chapter is by an acknowledged authority in the field. The chapters are written in an accessible style and a glossary of technical terms is provided in each volume.

General editors' preface

The history of philosophy, as its name implies, represents a union of two very different disciplines, each of which imposes severe constraints upon the other. As an exercise in the history of ideas, it demands that one acquire a "period eye": a thorough understanding of how the thinkers whom it studies viewed the problems which they sought to resolve, the conceptual frameworks in which they addressed these issues, their assumptions and objectives, their blind spots and miscues. But as an exercise in philosophy, we are engaged in much more than simply a descriptive task. There is a crucial critical aspect to our efforts: we are looking for the cogency as much as the development of an argument, for its bearing on questions which continue to preoccupy us as much as the impact which it may have had on the evolution of philosophical thought.

The history of philosophy thus requires a delicate balancing act from its practitioners. We read these writings with the full benefit of historical hindsight. We can see why the minor contributions remained minor and where the grand systems broke down: sometimes as a result of internal pressures, sometimes because of a failure to overcome an insuperable obstacle, sometimes because of a dramatic technological or sociological change, and, quite often, because of nothing more than a shift in intellectual fashion or interests. Yet, because of our continuing philosophical concern with many of the same problems, we cannot afford to look dispassionately at these works. We want to know what lessons are to be learned from the inconsequential or the glorious failures; many times we want to plead for a contemporary relevance in the overlooked theory or to reconsider whether the "glorious failure" was indeed such or simply ahead of its time: perhaps even ahead of its author.

We find ourselves, therefore, much like the mythical "radical translator" who has so fascinated modern philosophers, trying to

understand an author's ideas in his and his culture's eyes, and, at the same time, in our own. It can be a formidable task. Many times we fail in the historical undertaking because our philosophical interests are so strong, or lose sight of the latter because we are so enthralled by the former. But the nature of philosophy is such that we are compelled to master both techniques. For learning about the history of philosophy is not just a challenging and engaging pastime: it is an essential element in learning about the nature of philosophy—in grasping how philosophy is intimately connected with and yet distinct from both history and science.

The *Routledge History of Philosophy* provides a chronological survey of the history of Western philosophy, from its beginnings up to the present time. Its aim is to discuss all major philosophical developments in depth, and, with this in mind, most space has been allocated to those individuals who, by common consent, are regarded as great philosophers. But lesser figures have not been neglected, and it is hoped that the reader will be able to find, in the ten volumes of the *History*, at least basic information about any significant philosopher of the past or present.

Philosophical thinking does not occur in isolation from other human activities, and this *History* tries to situate philosophers within the cultural, and in particular the scientific, context of their time. Some philosophers, indeed, would regard philosophy as merely ancillary to the natural sciences; but even if this view is rejected, it can hardly be denied that the sciences have had a great influence on what is now regarded as philosophy, and it is important that this influence should be set forth clearly. Not that these volumes are intended to provide a mere record of the factors that influenced philosophical thinking; philosophy is a discipline with its own standards of argument, and the presentation of the ways in which these arguments have developed is the main concern of this *History*.

In speaking of "what is now regarded as philosophy", we may have given the impression that there now exists a single view of what philosophy is. This is certainly not the case; on the contrary, there exist serious differences of opinion, among those who call themselves philosophers, about the nature of their subject. These differences are reflected in the existence at the present time of two main schools of thought, usually described as "analytic" and "continental" philosophy. It is not our intention, as general editors of this *History*, to take sides in this dispute. Our attitude is one of tolerance, and our hope is that these volumes will contribute to an understanding of how philosophers have reached the positions which they now occupy.

One final comment. Philosophy has long been a highly technical subject, with its own specialized vocabulary. This *History* is intended not only for the specialist but also for the general reader. To this end, we have

tried to ensure that each chapter is written in an accessible style; and since technicalities are unavoidable, a glossary of technical terms is provided in each volume. In this way these volumes will, we hope, contribute to a wider understanding of a subject which is of the highest importance to all thinking people.

G.H.R.Parkinson
S.G.Shanker

Notes on contributors

Lewis White Beck is Burbank Professor Emeritus of Philosophy at the University of Rochester. His works include *A Commentary on Kant's Critique of Practical Reason* (1961), *Studies in the Philosophy of Kant* (1965), *Early German Philosophy: Kant and his Predecessors* (1969), *The Actor and the Spectator* (1975), *Critique of Practical Reason and Other Writings in Moral Philosophy* (1976), and *Essays on Kant and Hume* (1978).

Daniel Bonevac (Ph.D. Pittsburgh, 1980) is Professor and Chair of the Department of Philosophy at the University of Texas at Austin. He is the author of *Reduction in the Abstract Sciences* (1982), *Deduction* (1987), and *The Art and Science of Logic* (1990); the editor of *Today's Moral Issues* (1991); and a co-editor of *Beyond the Western Tradition* (1992). He has published articles on Kant, metaphysics, semantics, and philosophical logic.

Donald Becker is Assistant Professor of Philosophy at the University of Texas at Austin.

Patrick Gardiner is an Emeritus Fellow of Magdalen College, Oxford, and a Fellow of the British Academy. His publications include *The Nature of Historical Explanation* (1952), *Schopenhauer* (1963), and *Kierkegaard* (1988). He has edited *Theories of History* (1959), *Nineteenth-Century Philosophy* (1969), and *The Philosophy of History* (1974).

Daniel Breazeale is Professor of Philosophy at the University of Kentucky. His publications include *Philosophy and Truth: Selections from Nietzsche's Notebooks of the Early 1870s* (1979), and *Fichte, Early Philosophical Writings* (1988).

Robert C.Solomon is Quincy Lee Centennial Professor of Philosophy at the University of Texas at Austin. His publications include *In the Spirit of Hegel* (1983), *From Hegel to Existentialism* (1987), *Continental Philosophy since 1750* (1988), and *A Passion for Justice* (1990).

Willem deVries is Associate Professor of Philosophy at the University of New Hampshire. He is author of *Hegel's Theory of Mental Activity: An Introduction to Theoretical Spirit* (1988).

Leo Rauch is Professor of Philosophy at Babson College. His publications include *The Political Animal: Studies in Political Philosophy from Macbiavelli to Marx* (1981), *Hegel and the Human Spirit: A Translation of the Jena Lectures on the Philosophy of Spirit (1805–6)* with Commentary (1983), and *Introduction to the Philosophy of History, with Selections from The Philosophy of Right* (1988).

Robert Nola teaches philosophy at the University of Auckland. Most of his published work is in the philosophy of science. He has also published several papers on Plato, Marx, Nietzsche, and the sociology of scientific knowledge.

Kathleen M.Higgins is Associate Professor at the University of Texas at Austin. She is author of *Nietzsche's Zarathustra* (1987) and *The Music of our Lives* (1991). She is also co-editor of *Reading Nietzsche* (1988), *The Philosophy of (Erotic) Love* (1991), and *Thirteen Questions in Ethics* (1992).

Judith Butler is Professsor of Humanities at Johns Hopkins University and the author of *Subjects of Desire: Hegelian Reflections in Twentieth-Century France* (1987), and *Gender Trouble: Feminism and the Subversion of Identity* (1990).

Chronology

Unless otherwise specified, the dates assigned to books or articles are the dates of publication, and the dates assigned to musical or stage works are those of first performance. The titles of works not written in English have been translated, unless they are better known in their original form.

Introduction

Robert C.Solomon and Kathleen M.Higgins

The turn of the nineteenth century marked one of the richest and most exciting explosions of philosophical energy and talent, perhaps even comparable to the generation that gave birth to Socrates, Plato, and Aristotle. The enormity of the revolution set off in philosophy by Immanuel Kant was comparable, by Kant's own estimation, to the Coperaican revolution that ended the Middle Ages. The movement he set in motion, the fast-moving and often cantankerous dialectic of "German Idealism," inspired some of the most creative philosophers in modern times, including G.W.F.Hegel and Arthur Schopenhauer, not to mention the philosophers he inspired in opposition to him (Kierkegaard and Marx, for example) and virtually every major movement in the twentieth century, including analytic philosophy and idealism in Britain and America, phenomenology and existentialism in France and Germany, and much of the recent philosophy in Japan. Kant is often depicted as appearing virtually out of nowhere (in the far East Prussian town of Kønigsberg) to resolve several long-standing disputes in French and British philosophy, embracing the competing traditions of rationalism and empiricism. But the philosophical climate in German-speaking Europe was as vibrant with conversation and controversy as the more cosmopolitan centers of London and Paris, and one can fully understand the excitement and the brilliance of the birth of German Idealism by first appreciating the intellectual fervor surrounding and preceding Kant. The chapter that opens this volume, by the distinguished Kant scholar Lewis White Beck, explains that fervor and the philosophers who were part of it. It is in that context, too, that one can appreciate the continuing debates and battles that follow Kant.

Indeed, much of the history of nineteenth-century philosophy in Germany can be summarized as the attempt to continue,improve on, defend, or demolish the philosophical rationalism established by Kant.

Kant's first appearance in philosophy was a professional but not particularly distinguished dissertation published in 1770, when the philosophy professor was already nearing 50. It caused some local controversy, but it is remembered and of interest today only in the reflected light of the great works that were to follow. Among these were three remarkable and remarkably difficult *Critiques,* the *Critique of Pure Reason* (1781), the *Critique of Practical Reason* (1788), and the *Critique of Judgment* (1790). The first *Critique* examined the capacities and limitations of reason and the necessary conditions for knowledge. The second explored and defended the concept of morality and autonomy in human action. The third, intended to be a synthesis of the first two and bring "the entire critical undertaking to a close," included wide-ranging discussions of aesthetic taste, and the concept of teleology in the biological sciences. Together, the three *Critiques* established philosophy as a new profession, and it is often said that Kant was its first true professor. The difficulty of the *Critiques* was more than compensated for by their brilliance and their importance. The *Critique of Pure Reason* in particular has often been called the most important philosophical text of modern times. Daniel Bonevac, in his essay on the first *Critique,* suggests that no one can call him-or herself a philosopher today without first mastering, or at least coming to terms with, that book.

Kant was an unabashed rationalist, a designation that will be explored in some depth in the chapters to follow. Although his first *Critique* announces itself as a "criticism" that is intended to show the limits of reason, he leaves no doubt that he is, first and foremost, a defender of reason, the essentially human faculty. But Kant's rationalism and the various conceptions of reason and rationality explored by the various German Idealists must be viewed against a background of religious piety and, in some instances, anti-rationalism. Kant himself was a pious Lutheran and sought to bring reason and faith together, defending faith itself as a rational attitude. But surrounding Kant were several philosophers who denied both the supremacy of reason and the rationality of faith, among them Jacobi and Hamann, who was one of Kant's best friends in Kønigsberg. So, too, that movement called "the Enlightenment," which took reason as its guide and found in Kant its most eloquent German defender, encountered stiff resistance and opposition in Germany. Herder attacked the Enlightenment in the name of what we would now call "multiculturalism," defending the distinctive features of German culture. Many of the German Idealists following Kant nevertheless turned a skeptical eye on the Enlightenment, which many of them considered

overly utilitarian and insufficiently attentive to spiritual matters. Early in the nineteenth century, Fichte and Hegel would defend their concepts of reason against a growing school of romantic philosophers, incorporating many of their ideas and images in their philosophy. Their colleague Friedrich Schelling would actually join and lead the romantics in their critique of the Enlightenment, and by the end of the first decade or so of the new century the concepts of both reason and Enlightenment had been hopelessly muddied. By the middle of the century, Kant's celebrated faculty of reason had been attacked from all sides, by his self-proclaimed followers who altered it beyond recognition, by the young materialists Feuerbach and Marx who insisted that reason was secondary to the necessities of life even in the realm of thought, by the German Idealist Arthur Schopenhauer who demonstrated at great length the primacy and the irrationality of the Will, by the Danish philosopher Kierkegaard who rejected the very idea of a rational explanation of human life or a rational defense of Christianity. Indeed, if there is a single concern that ties together all of the figures and the chapters of this volume, it is the nature and place of reason in human affairs.

In the chapters to follow, we have allowed each author their own voice. As the themes, the philosophers, and their books vary, so do the approaches and styles that seem appropriate. Thus the chapter on German philosophy before Kant by Lewis White Beck is historically oriented, while Daniel Bonevac's chapter on Kant's first *Critique* is an unusually clear exposition and explanation of the strategy and difficulties of that text. Don Becker interprets Kant's well-known moral philosophy in the context of his less familiar political philosophy, while Patrick Gardiner explains how Kant attempts to bridge the "two jurisdictions" of the first two *Critiques* with his aesthetic conception of universal subjective judgments and teleological explanations in the *Critique of Judgment*. Daniel Breazeale introduces the complex philosophy of Fichte and Schelling, emphasizing the early works in Jena, the site of many of the new century's most dramatic philosophical innovations, and Robert Solomon traces a path through Hegel's notoriously labyrinthine *Phenomenology of Spirit*. Willem deVries describes Hegel's attempt to derive metaphysics from logic, traces the development of that logic, and evaluates its success. Leo Rauch explores Hegel's "philosophy of objective spirit" and the emergence of freedom and reason through history, especially in his *Philosophy of Right*. Robert Nola describes the philosophical turmoil following Hegel's death in 1831 and the emergence of "the young Hegelians," especially Marx and Feuerbach. Kathleen Higgins sympathetically discusses the pessimism of the crankiest Kantian, Arthur Schopenhauer, and, finally, Judith Butler discusses the despair of the Danish "existentialist" Søren Kierkegaard.

While the chapters were prepared separately, there are many points of

contact and contrast—for instance, between the logical analysis of concepts in Kant, Fichte, and Hegel, the aesthetics of Kant, Schopenhauer, and Kierkegaard, and the political philosophies of Kant, Hegel, and Marx. We are deeply indebted to all of our contributors and grateful both for their good scholarship and for their respect for our deadlines. The volume is, we think, a feast of interpretation and commentary, and we hope that the reader enjoys reading it as much as we have enjoyed putting it together.

CHAPTER 1

From Leibniz to Kant

Lewis White Beck

INTRODUCTION

Had Kant not lived, German philosophy between the death of Leibniz in 1716 and the end of the eighteenth century would have little interest for us, and would remain largely unknown. In Germany between Leibniz and Kant there was no world-class philosopher of the stature of Berkeley, Hume, Reid, Rousseau, Vico, or Condillac. The life and philosophy of Kant, however, raised some not-quite-first-class philosophers to historical importance. The fame of these men is parasitic upon Kant's greater fame. There were philosophers who did not achieve even this derivative fame, for not all roads led from Leibniz to Kant. I think, nevertheless, that we can best orient ourselves in a brief account of eighteenth-century German philosophy by seeing it as a preparation for Kant.

Leibniz was the last great philosophical system-builder of the seventeenth century, and his bold speculations and systematic wholeness were more characteristic of the seventeenth- than of the eighteenth-century philosophers. His peers were Descartes, Malebranche, Arnauld, Hobbes, Locke, and Spinoza, and in comprehensiveness and variety of genius he surpassed each of them. His system had an answer to almost every question put to it; he was said to be "an academy of science all by himself," and the principal objection to his grand baroque philosophical system was that it was—simply unbelievable. To accept it all would have required a speculative faith and a blind confidence in the metaphysical powers of the human mind that few philosophers of the eighteenth century could muster.

Christian Wolff, his most important disciple, did not make a *summa* of

Leibniz's philosophy, but both his followers and opponents saw Wolff as doing precisely that. They accordingly called his philosophy the "Leibniz-Wolffian philosophy," a name which has become fixed in spite of both Leibniz and Wolff 's renunciation of it. Modern scholarship shows the degree to which this tide is inappropriate,[1] yet the Leibniz-Wolffian philosophy was the dominant intellectual system and movement in Germany from about 1720 to about 1754, the death of Wolff, and it provided the main opposition to Kant's philosophy until near the end of the century. The rise and fall of the Leibniz-Wolffian philosophy in its controversies with its opponents is the subject matter of this chapter. I deal almost exclusively with topics now important chiefly for an understanding of Kant and German Idealism.

But before we turn to these topics, something must be said about the general climate of opinion in Germany at this time. In all Protestant countries of western Europe, there was an intellectual awakening called the Enlightenment. "Enlightenment," Kant wrote, "is man's release from his self-incurred tutelage." Tutelage is allowing or requiring someone else to do one's thinking, and it is self-incurred because most human beings do not develop the skill and the courage to use their own reason. They surrender their freedom to those who will think for them in matters political, religious, and moral. Kant did not believe he lived in "an enlightened age," but did say he lived in an "age of enlightenment" when progress was being made to independent thought. But the specific forms that Enlightenment took varied from country to country; it depended upon the particular form of tutelage in each country, from which thinkers strove to emancipate themselves.

The German Enlightenment took place in a feudal environment of scores of small absolute monarchies in which Lutheran passive obedience and the eye of the local monarch ensured that the established order of things was regarded with sacred awe by the *Bürger*.[2] While the *philosophes* of France were not merely anti-clerical but also antireligious (materialists, atheists, freethinkers, skeptics), what was unique to the German Enlightenment was that it originally had a profoundly religious motive.

Pietism was a religious awakening at the end of the seventeenth century which had much in common with the persecuted Jansenist sect in France and the Methodist movement still to come in England. Pietism meant a return to a simpler form of Lutheranism, emphasizing the emotional and moral rather than the ritual and dogmatic aspects of the established churches. Instead of churches, there were evening gatherings in the homes of individual Pietists for communal devotion; every man was a priest, drawing inspiration from his own reading of scripture and applying its lessons to everyday life. Though the movement was not free of irrational elements, it was enlightened in encourag-ing its members not to defer to

someone else who would do their thinking for them. Naturally all this produced plurality of opinion and diversity of faith, but its emphasis upon good works (establishing schools and orphanages, for instance) brought it in line with the Enlightenment movement in other countries where the motivation was perhaps more intellectual and political.

There were, in fact, two Enlightenments in Germany. Besides the intellectual Enlightenment pursued by the Leibniz-Wolffian philosophers, there was also a Pietistic Enlightenment. Surprisingly they both originated in the same place, the University of Halle, a Pietistic institution founded by the Elector of Brandenburg primarily for the training of the bureaucracy required by this largest and most important German state.

The father of the Pietistic Enlightenment was Christian Thomasius (1655–1728), who had been banished from Saxony on religious grounds. Thomasius was an active reformer but not a deep philosopher. His ideal of education was that it raise not the cloistered scholar but the *honnête homme,* imitating France in "polite learning, beauty of mind, good taste, and gallantry." In order to reach a larger audience, he lectured and wrote most of his books in German, not Latin. He claimed academic freedom, taught religious toleration, and attempted to reform legal practices by outlawing torture and removing heresy and witchcraft from the reach of the law. As a Pietist he did not doubt the authority and authenticity of revelation, but he established the basis of law in ethics, ultimately in reason and experience. Pietism is almost always associated with an occult and quasi-mystical philosophy of nature, and this kept the German Enlightenment Pietists from participating in the great scientific revolution at the end of the seventeenth century.

Unfortunately Wolff and Thomasius were on a collision course. Intellectually they were not in serious disagreement on most substantive questions (though their interests were widely divergent). Personally their relations were correct, though not close. Thomasius apparently took no part in the ignoble campaign which drove Wolff from Halle just as he had himself been driven from Leipzig. But their disciples carried on a running controversy for the next forty years, and it was marked by *odium theologicum* and general nastiness on both sides.

WOLFF

Life and works

Christian Wolff was born in Breslau in 1679. With support from Leibniz he was appointed lecturer in mathematics at the University of Leipzig in

1702 and, four years later, professor of mathematics at the University of Halle. Wolff was no creative mathematician, but he found in mathematics the model for rigorous thinking in other fields. In this he simply followed the lead of Descartes and Leibniz.

Soon Wolff was teaching and writing philosophy, philosophy then meaning both the natural sciences and the subject which is today called philosophy. He published copiously on the experimental sciences and also on logic, metaphysics, cosmology, psychology, political theory, and natural theology in a series of large German books, most of which were entitled *Vernünftige Gedanken* ("Rational Thoughts") on the different areas of knowledge.[3] The contents and expository skill of these books led to their widespread acceptance as textbooks. His successes in publishing extensively used books, and his victories in the annual competition for paying students, incited intense rivalry between Wolff and the less successful Thomasian Pietist professors. They seized the opportunity to charge Wolff with heresy when he held, in a public lecture as rector of the university, that the resemblances between Chinese and Western ethics showed that ethics was based on universal human reason and human nature, not on divine revelation vouchsafed only to Western civilization. They represented to the King of Prussia, Frederick William I, that Wolff 's determinism and fatalism meant that he should not punish deserters from his army because, being determined, they could not have helped doing what they had in fact done.

Enraged by this *lèse-majesté,* the choleric King dismissed Wolff and threatened to hang him in forty-eight hours if he was still on Prussian soil. Wolff had already received a call from the Calvinist University of Marburg, which he now accepted. He taught in Marburg for seventeen years. Heard by an international student body, more of whom could understand Latin than German, he repeated and expanded his series of *Vernünftige Gedanken* into large volumes of scholastic Latin addressed to an international readership. So great was his fame, and so scandalous had been the behavior of Frederick William I and his "Tobacco Cabinet," that efforts were repeatedly made to recall him to Prussia. He returned only in 1740 when the new King, Frederick the Great, made him chancellor of the University of Halle and granted him a patent of nobility and a large stipend. At the time of his death in 1754 he was certainly the best-known thinker in Germany, fully deserving the honorific title of Praeceptor Germaniae.

The mathematical ideal in philosophy[4]

Hobbes, Descartes, Spinoza, and Leibniz all shared a common ideal for

philosophy, that it should attain the clarity and certainty hitherto available only in mathematics. Wolff is quite explicit about the relation of mathematics to philosophy. "The rules of mathematical method," he says,[5]

> are the same as the rules of philosophical method.... The identity of philosophical and mathematical method will be a surprise only to one who does not know the common source from which the rules of both mathematics and philosophy are derived.

This common source is "true logic" or "natural logic" of the workings of the human mind, not a finished logic which is itself a science.

Lest the identity of philosophy and mathematics appear to be wholly quixotic, it is essential to remember that "philosophy" and "mathematics" did not then mean exactly what they mean now. Philosophy, well into the eighteenth century, included the sciences; and though work of the highest kind in pure mathematics was being performed by Leibniz and Lambert and others, the mathematics that was the cultural model for the Enlightenment was applied (or, as it was then called, "mixed") mathematics. Wolff's mathematical works contain far more information about astronomy, meteorology, geodesies, and even architecture than they do topics in pure mathematics. The root idea of the mathematical model is that computation and measurement are essential to any body of advanced scientific knowledge.

In the true method, formulated by Descartes and followed with little change by Wolff, everything certain in our thoughts depends upon the order of our thoughts, a step-wise procedure of moving from the simplest and most indubitable to the less certain and more problematical. Mathematics begins with définitions, proceeds to fundamental principles (axioms), and thence to theorems and problems (constructions). The product of a définition is a clear and distinct idea, evident to attention and communicable to others. Mathematical theorems are demonstrated by analysis of the contents of definitions and axioms, demonstration taking the form of showing that an alternative to a true theorem is self-contradictory or contradictory to another established truth.

In the syllabus for his mathematics lectures in 1731[6] Wolff tried to show both the importance and the inadequacy of mathematical knowledge. Mathematics deals only with the observable phenomena in space and time (which are subjective), and it operates with images; ontology, on the other hand, deals with being *qua* being and replaces images with exact concepts.

How well did the mathematical ideal stand? In 1762 the Royal Academy of Sciences in Berlin offered a prize for the best essay on the question: 'Whether metaphysical judgments generally, and in particular

the fundamental principles of natural theology and morals, are capable of proofs as evident as those of geometry?" A disciple of Wolff, Moses Mendelssohn, took the prize with an essay giving an affirmative answer, with which Wolff would have agreed. The runner-up, with a negative answer, was the unknown Immanuel Kant. In this respect history has followed Kant, not Wolff and Mendelssohn.

The marriage of reason and experience

One of the perennial problems of philosophy is to determine the roles of reason and experience in knowing. In the seventeenth and eighteenth centuries it was the subject of controversy between philosophers we now call rationalists and those we call empiricists. Among the empiricists we count Locke, Berkeley, Hume, Reid, and Condillac; among the rationalists, Descartes, Malebranche, Spinoza, and Leibniz.

Wolff is sometimes considered the arch-rationalist, but we must enquire into the *kind* of rationalist he was.[7] A rationalist like those just listed believes that *reason alone,* or rational intuition, is able to discover truths that are independent of experience and that could not be learned *from* experience, but that necessarily apply *to* experience. Such truths have been called, especially since Kant, *a priori,* in contrast to truths *a posteriori,* i.e. truths learned only from experience.

Wolff frequently insists that there are no *a priori* truths in *this* sense; he says that there is no human *pure* reason devoid of sense content; he agrees with the Scholastic teaching, "There is nothing in the intellect that was not first in sense." He rejects the theory of innate ideas, which has always been one of the principal tenets of the rationalist school. Hence Wolff may seem to be no rationalist at all; he is not a rationalist in the strictly defined sense of the preceding paragraph, but his style and vocabulary give a rationalistic veneer to his thoughts because he seems to generate *a priori* knowledge by improving upon empirical knowledge.

He attempted (successfully, in his own judgment) to derive the principle of sufficient reason from the law of contradiction.[8] Leibniz had attempted to keep these two principles separate and independent of each other, and had ascribed each to a very different metaphysical source (respectively the will and the intellect of God). Wolff, on the contrary, contends that it is a logical truth that every true judgment has a sufficient reason for being true. Though Wolff does not claim to derive empirical truths from the principle of sufficient reason (and, ultimately, from the law of contradiction), he does claim (and makes good his claim) to be able to give a rational account of what was originally perceived empirically.

He does so by drawing a distinction between two kinds of knowledge, which he calls historical and philosophical knowledge.[9] He does so in parallel with Aristotle's distinction (*Posterior Analytics,* Book I, ch. 13) between *knowledge of fact* and *knowledge of reasoned fact*. Historical knowledge is knowledge based on the perception of a raw fact, something existing or happening. But by memory, classification, measurement, hypothesis-formation, and perhaps simple experiments we clarify our knowledge of a fact by seeing it as a "certain kind" of fact. The ideas of sense become ideas of reason (the *vernünftige Gedanken* of Wolff's book titles), reason being the capacity for "seeing with the mind's eye" the connections of ideas and their sufficient conditions. All the knowledge that reason has or produces comes from experience - historical knowledge is the basis of philosophical knowledge—but it is so processed by reason into definitions, principles, axioms, probable hypotheses, and well-tested laws of nature that a subtle change is introduced into our historical knowledge of fact: knowledge of fact becomes knowledge of reasoned fact. Going beyond what has been actually observed, knowledge of reasoned fact extends to facts not yet experienced. Wolff likes to say that there is a marriage of reason and experience *(connttbium rationis et experientiae)* which he does not wish to disturb.

There are two movements in knowledge. The ascent from knowledge of fact to principles and reasons is the analytical method of Descartes (Kant's regressive method); the descent from reason to experience is Descartes's synthetic (Kant's progressive) method. The knowledge of reasoned fact was commonly in Wolff's day called *a priori* knowledge[10] (knowledge from reason, not experience), even though for Wolff its ultimate and irreplaceable source is experience.

We can now summarize Wolff's kind of rationalism. He *is not a rationalist* in the sense of the belief that pure reason without need of experience can produce *a priori* knowledge (in mathematics and metaphysics, for example). He *is a rationalist* in a loose sense in that he emphasizes the function of reason in converting raw data of the senses into reasonable knowledge. With his armies of syllogisms in valiant array, Wolff demonstrated everything from the existence of God to theories in astronomy; he proves that German coffee houses should be modeled after those of England. No wonder Wolff is generally thought of as a rationalist!

Ontology and special metaphysics

The keystone of Wolff's stupendous edifice is his *First Philosophy, or Ontology,* published in Latin in 1729. In 1720 he had published a volume

sometimes known as the *German Metaphysics* whose accurate and instructive title is *Rational Thoughts on God, the World, the Soul of Man, and All Things in General.*

The subject matter of ontology is being in general, demonstrative knowledge of what it is that makes something possible if it is possible and actual if it is actual. It is like Aristotle's "First Philosophy" which deals with being *qua* being (*Metaphysics,* Book IV, ch.1). Ontology deals with questions and concepts common to all branches of knowledge.

Questions about the various kinds of being are reserved for the several volumes on special metaphysics, viz., the being of God, the existence of whom follows only from his possibility (the ontological argument), the being of the soul, and the being of the world. The actual world and the actual soul are made actual by "a complement of possibility"[11] which renders possible things actual. Kant destroyed this connection of possibility and actuality by asking the question: Is the complement possible? If it is not, it is impossible and cannot serve the purpose. If it is, it is just another possibility and contributes nothing toward actuality. There is no valid inference from possibility to actuality. The converse inference, from existence to possibility, is explored by Lambert, Crusius, and Kant.

Many of the 964 articles in the *Ontology* give definitions of metaphysical terms such as being, existence, possibility, essence, condition, thing, attribute, simplicity, substance, space, time, cause, quality, etc. These concepts are shuffled, combined and separated, contrasted, and compared in an almost mechanical procedure.

One of the most important concepts is that of substance, defined as follows: "What contains in itself a *principium* [roughly: a cause] of changes is a substance."[12] Each substance contains in itself a sufficient condition for a change in itself or in other substances. If the change is motion, the monad is a physical substance; if the change is mental, the monad is a spiritual substance. Only one substance contains the cause of its own being, and that substance is God. Thus arise the three divisions of special metaphysics: rational theology, rational psychology, and rational cosmology. It will be noticed that Wolff is closer to Descartes than to Leibniz, who had asserted that all substances are spiritual and had denied that one substance could cause a change in another. Wolff, very tentatively, holds the doctrine of pre-established harmony only for the case of relations between mind and body monads.

Wolff follows Leibniz in denying absolute Newtonian space, and agrees with Leibniz that space is a subjective order of appearances of substances. He holds a mechanical view of nature, which consists of simple unextended physical monads interacting by contact with each other, the whole showing intelligent design and especially purposiveness for human benefit.[13] The soul is a simple substance with a *vis repraesentativa* or a

power of being conscious; the soul is immortal and the will free. Like Leibniz in his *Theodicy,* Wolff strove to reconcile freedom and necessity, but with equal ill-success.

Moral philosophy

Wolff wrote more on practical philosophy (ethics and law) than on any other subject. There is little new in Wolff's theory, but it is superbly organized and undoubtedly influenced Kant's articulation of ethical theory in his *Metaphysics of Morals*. Kant cites Wolff as the exemplary representative of the best of the four types of heteronomous ethics, the ethics of perfection.[14]

The intellect conceives of a perfection, which is the value aspect of truth as the perfect harmony and interconnection of the essential attributes of a thing following from its intrinsic essence. True being (as object of knowledge) and true good (as object of desire) are identified. The will necessarily strives for a perfection which the intellect has discerned. Rational willing is definitive of morality. The achievement of a perfection is attended with pleasure, but the test for an action is not its consequent pleasure, but its rational motivation and justification.

Natural law requires that each person strive to achieve their own perfection and also that of others. Revelation is not required to teach men their duties, nor is the promise of divine reward needful to move people to do the good.

The completion of Wolff's system in aesthetics

A great gap in Wolff's system was the lack of a theory of beauty and fine art. The last decade of Wolff's life was a time of extensive literary dispute concerning matters of taste. There were controversies between defenders of the classical forms and harbingers of the romanticism that was yet to come. There was great competition between those who would emulate French drama and those in favor of English models, and still others (e.g. Lessing) who wanted to develop a native drama with German themes.

It is easy to see why a comprehensive philosophical movement like Wolffianism should be concerned to develop a theory of art, in spite of the fact that there certainly are few philosophical theories less likely than Wolff's to be fruitful concerning beauty and art. Wolffian theories of art

were produced by two disciples, Alexander Baumgarten of Halle (later Frankfurt on the Oder) and Moses Mendelssohn of Berlin. .

Baumgarten[15]

In Leibniz-Wolffian philosophy the perfection of sense would be achieved when a sensuous idea was so clarified and rendered so distinct that it would become an abstract intellectual idea. Indeed the entire Wolffian program may be summed up in Wolff's efforts to replace facts given in sense with reasoned facts from which the unique, ineffable content of sense had been evaporated. The perfection of sense is reason, and there is only a difference of degree between the clarity of reason and obscurity of sense. To raise the perfection of sense means: to replace percepts with concepts.

This feature of Wolffian rationalism made it indifferent to the arts, for the artist is one whose skill makes it possible to achieve a perfection of sense which is the object of a perfect, direct intuition, not object of abstract thought got at by omitting the specificities of a singular perception. According to Baumgarten sensation can be perfected by so enhancing its vividness and clarity that there will be pleasure in its mere contemplation.

The irreducible sensory component in such a perception is called the aesthetic and the intuitive by Baumgarten. Sense, which is the lower cognitive faculty, is the higher faculty in the contemplation of beauty. A perfection (of form, color, sound) apprehended by sense instead of by reason is beauty. Aesthetics is the "science of the beautiful."

Mendelssohn

In 1755 Moses Mendelssohn published *On Feelings (Empfindungen),* a modification of Baumgarten's views which marks a sharp advance in the direction of Kant's mature aesthetic theory and the aesthetic theory of the later idealists and romantics.

The human mind, he holds, is too limited to be able to sensuously observe the variety-in-unity of ontological perfections, which is discernible only by reason. Thus far Mendelssohn stands with Wolff and Baumgarten, but he now adds: we can sensuously contemplate the variety in unity of the mind's own acts and passions, sensations, thoughts, and emotions. He calls this the "harmony of the powers of the soul." The directly felt perfection of perceiving, not the perception of an antecedent perfection in the perceived object, gives rise to disinterested aesthetic pleasure in the harmonious play of our faculties. Mendelssohn here makes an important and permanent contribution to the history of art and aesthetic theory. He

teaches that beauty is not predicated upon an objective perfection (of color, design, morals, or whatever is found in the work of art); it is a perfection of perception, not a perception of perfection.

Pleasure usually accompanies the satisfaction of some previously existing desire, but art and beauty are not normally enjoyed because of the pleasure they afford by satisfying some antecedent desire. In addition to perception and will, each with its own attendant pleasure, there is another faculty of the mind which has its own peculiar pleasure. This faculty Mendelssohn calls *feeling* or approval *(Billigungsvermögen)* by which we experience "disinterested pleasure," a pleasure different from that of satisfied desire or curiosity.

Mendelssohn explains this pleasure by our satisfaction in the harmonious function of all the *Seelenkräfte,* when feeling and willing and perceiving go together to produce a delectable state of mind. Each person's taste will be affected by their physical and even physiological make-up, but with the advance of education and general culture more pervasive satisfactions will replace the doctrine of *à chacun son gout*. This harmony of the powers of the soul is involved in both the enjoyment of art and its creation by genius. Genius is an "imitator of divinity," a "second creator."

CRUSIUS

The Pietist campaign against Wolff was fought on two levels. Motivated by *odium theologicum,* envy, and nepotism as well as by genuine concern incited by Wolff 's apparent affinity with Spinozistic pantheism and fatalism, the Halle Thomasians Budde, Lange, and Walch conducted a dirty campaign that continued even after Wolff had been banished. But these Thomasians, like Thomasius himself, were not systematic philosophers of Wolff's caliber; they found fault with Wolff, but offered no interesting alternative. The most important alternative was that of Crusius.

Christian August Crusius was born in Leuna near Merseburg (Saxony) in 1715 and died in Leipzig in 1775. Almost all the men in his family were Lutheran clergymen, and he held professorships in both philosophy and theology and was a pastor holding important posts in the Lutheran hierarchy. About 1750 he gave up philosophical work altogether and devoted himself to theological and biblical studies and the care of souls.

In place of mathematics,[16] Crusius thought of theology as the science whose relations to philosophy must be understood. Philosophy, according to him, is not a sufficient ground for religious faith and human virtue; it is not even essential to the conceptualization of theological truth, since the

truths established in philosophy may be overturned by the greater authority of theology. "We cannot think something" was the mark for the impossible among most Enlightenment philosophers, but for Crusius there were conditions under which the inference from inconceivability to impossibility may be suspended: if the thing inconceivable by us may be conceivable by a more perfect mind, or if "We recognize an obligation to regard something inconceivable as possible or actual in order not to act contrary to the most important rules of human perfection" (which include, of course, revelations of the commands of God).[17]

From all this it is easily seen how opposed Crusius was to Wolff. Wolff as a leader of the intellectual Enlightenment was bent upon extending the scope and power of human reason and denying any constraints upon it; Crusius as a leader of Pietistic thought was more concerned to restrain the ambition to explain everything; he tried to determine and fix the boundaries of human intellect when dealing with the brute facticity of the contingent world and the mysteries of religion. That he did so without the obscurantism of the early Thomasians, by developing a sophisticated epistemology as an alternative to Wolff, is a mark of near greatness in this almost forgotten man.

Ontology and theory of knowledge

For Crusius existence, not possibility, is the fundamental concept. In this he differs markedly from Wolff, who asks what is the ground of the possibility of something prior to asking what it is that makes it actual if it is actual. Wolff's answer to this question concerns logical possibility, i.e. non-self-contradictoriness. Crusius's ontology is to challenge Wolff's account of the role of logical possibility in the explanation of existence. We reach the concept of possibility by first finding existent things and then, by "an abstraction from existence" (the reverse of the "complement of possibility"), we find that whatever exists is also possible, but not the converse. If nothing existed, nothing would be even possible. The concept of possibility requires the concept of existence, but not the converse.[18]

Crusius is here speaking, obviously, of what he calls real possibility, not ideal possibility (i.e. possibility of being thought, because noncontradictory). Real possibility is the possibility inhering in things that might exist outside and beyond our thought of something merely noncontradictory. There can be this real possibility only if there are in the world existing things with forces adequate to bring about the actualization of this possibility.

Understanding has the inexplicable faculty of being conscious of ideas.

Reason is the perfection of understanding, consciously recognizing truth as truth. Two activities of reason are to be distinguished; reason *in concreto,* which is the capacity functioning in a single individual with their various quirks and dispositions; and reason *in abstracto,* which is the "complex" of the essential forces of human understanding in general. Only reason *in abstracto* is capable of objective knowledge.[19]

By a kind of denudation we find simplicity and clarity in sensations and other representations. We remove in thought all accidental properties of things, and we are left only with the essential relations that things necessarily bear to one another. Besides noncontradiction and identity there are relations that show the ultimate unanalyzable real forces of things. There is intuitive knowledge of simple, clear, and necessary relations of ideas stated by Crusius as basic laws of thought. Instead of Wolff's single supreme condition (law of contradiction) and its corollary (law of sufficient reason), Crusius states five laws:

(a) The law of inseparables: Whatever cannot be conceived without something else cannot exist without that other (*Metaphysics,* § 15); (b) The law of incompatibles: Whatever cannot be thought in connection with another thing cannot exist with that thing (§ 15); (c) The law of space: Everything that is is somewhere in space (§ 48); (d) The law of time: Everything that is is somewhen or at some time (§ 48); (e) The law of contingence: That whose nonbeing may be conceived may at some time have not existed (§ 33).[20]

These laws are based upon "the nature of human " which is "the supreme criterion of possible and actual things."[21] Kant thinks that Crusius's epistemological principles can correspond to ontological truths only if there is a pre-established harmony between the knower and the known.[22] Crusius, of course, will not accept this Leibnizian theory, but he states repeatedly that God has "placed the marks of truth in the human understanding."[23]

Freedom and the principle of sufficient reason

The principle of sufficient reason is not listed among the basic laws of thought. Though a valid principle it is not an independent principle; it is, rather, a corollary deduced from the law of the inseparable. Crusius, who certainly had not read Hume, states that we cannot think of a happening or a coming-to-be without associating it, in intuition, with some other precedent event. (Hume, of course, about the same time flatly denied this impossibility.)[24] But Crusius says: "Anyone who observes himself clearly sees that nothing that comes to be may be thought except when one at the

same time admits that there is another thing that has power sufficient to produce it."[25] He concludes, like Hume, that causation is neither analytically necessary nor an empirical generalization, but he does not draw Hume's skeptical conclusion.

For any coming-to-be we search for a substance or thing that has the force or power (otherwise inscrutable) to bring this about. Reason must accept the forces and powers it empirically discovers in nature without thinking that they are logically necessary.[26]

The law of efficient causation shown in the previous paragraphs to be a corollary of the law of the inseparable has several corollaries of its own, and they may be collectively called the law of sufficient reason. Crusius's Latin *Dissertation on the Use and Limits of the Principle of Determining Reason, Commonly Called Sufficient Reason* (1743) is based on his unwavering adherence to the freedom of the will, but uncompromising rejection of any theory of freedom of the will compatible with the Wolffian principle of sufficient reason. He distinguishes between *determining* reason and *sufficient* reason. The former is a reason which makes its consequence uniquely necessary, and that principle underlies determinism and fatalism. But that principle, he holds, is not demonstrable by the principle of contradiction, and therefore is not universally valid. A sufficient reason,[27] on the contrary, may have diverse consequences, and is compatible with freedom of the will.

Crusius's "solution" to the problem of free will is one of the standard ones: nature is the realm of strict determinism, but man is an exception to this rule of the law of determining reason. He believed that the will is free and therefore believed he had to relax the strict principle of determinant reason and accept the looser condition of sufficient reason. Then the same conditions may be "sufficient" for me to do A or to do B, and whichever I do I freely do because these reasons for A or B are supplemented by a free human decision. But it is patently wrong to call the conditions "sufficient" when they must be supplemented by a free act of will.

Here we have a fine example of Crusius's modifying epistemological conclusions when they conflict with faith and morals. This was not the first time, nor will it be the last, when moral conviction takes precedence over logical analysis.

Virtue is the agreement of human actions with the commands of God.[28] Hence Kant correctly lists Crusius as the exemplary representative of "theological moralists" who hold (correctly) that there is an objective standard of morality but also (incorrectly) that the standard lies in the will of God instead of in the rational will of man.[29]

Having established (to his satisfaction) the freedom of the will as the capacity for absolute spontaneity of action, Crusius believed that he had established the only possible foundation for imputing responsibility and

for justifying reward and punishment. The duty of man is to obey God, not directly to seek perfection and pleasure.[30] The love of God is the pure moral motive, like respect for the moral law in Kant. For guidance in morality man has an inborn conscience and a will to virtue. Since mankind and its moral perfection are the final end of God, we human beings can believe that obedience to and love of God will in fact lead to blessedness, even if only in another world.

With these views and his Pietist *habitus* it is not hard to see why the young Crusius gave up his philosophical career after only twelve years. Theology's gain was philosophy's loss.

LAMBERT

Johann Heinrich Lambert was born in Mühlhausen, Alsace, in 1728. Unlike Wolff he was a creative mathematician; he was the first to demonstrate that *e* and π *(pi)* are irrational numbers, and he was a pioneer in non-Euclidian geometry. He is generally regarded as the father of the science of photometry, and his name is commemorated in the "Lambert-Beer law" of the absorption of light, and in the name of a fundamental unit of illumination, the "lambert."

Mathematics and simple ideas

Lambert speaks as an almost fanatical mathematician when he says: "What cannot be weighed and calculated doesn't concern me. I understand nothing of it." "One will not give the name of 'perfect scientific knowledge' to philosophy when it is not at the same time completely mathematical."[31] "Wolff brought about half of mathematics into philosophy; now it is a matter of bringing the other half."[32] The half Wolff had brought in was the method of definition and proof, but he did not bring to philosophy the part of mathematics which concerns intuition, postulation, hypothesis, and construction; by taking arbitrary definitions "as it were, gratis," "without noticing it he hid all the difficulties in them."[33]

When Lambert first read Euclid, long after he had studied Wolff's theory of geometry, he was astonished, he says,[34] to find that Euclid had begun with simple, clear, and distinct intuitions of lines, points, and angles, and not (as Wolff had done) with nominal definitions, the applicability of which to figures in space was at least questionable. He thought that Wolff had done nothing to establish die truth of his premises

and correspondence between theorems and the actual structure of figures in space. Still, "The honor of bringing the right method into philosophy was reserved for Wolff," he says. "Whoever wants to profit most from Wolff's writings should begin with them, and then survey writings which more or less diverge from his. I do not hesitate to include here [the works of] Darjes[35] and Crusius." But the most Wolff could establish was the possibility, not the necessity and objective reference, of mathematical knowledge. There was a gap between logical truth and experience, between possibility and existence.

How is a priori knowledge possible?

To fill this gap Lambert, like Wolff, distinguished between ordinary and scientific knowledge of things.[36] Scientific knowledge establishes clear and distinct ideas of experience and supplements them with hypothetical *Lehrbegriffe*. Lambert then asks: to what extent can scientific knowledge be *a priori*?, using the term *a priori* in a stricter sense than Wolff, and approximating Kant's usage to refer to concepts that could not have arisen out of experience.[37] Experience is only the occasion of our having *a priori* knowledge,[38] but it is experience that gives existential reference to *a priori* knowledge which, without experience, is limited to the possible and the necessary. Though we suppose that it applies to the actual, the specificities of the actual - i.e. which possibilities are actual in this world—are not known *a priori*. But we have *a priori* knowledge of the contents (objects) of simple ideas and not just of their formal relations to each other.

In giving the "mechanism," so to speak, of *a priori* knowledge, that is, in explaining *how* we know anything *a priori,* Lambert turns to the "anatomist of ideas," Locke, for the theory of simple ideas of which, and by means of which, Lambert believes we have *a priori* knowledge.

Simple ideas are said to have only one (atomic) predicate; they are equivalent to their *Merkmal* (sign or criterion) with no hidden predicates, and they have insufficient complexity to be liable to self-contradiction (and for that reason they are possible). Simple ideas are clear even in the mind of a solipsist, and so are not dependent on the real existence of their objects. What is most important about simple ideas is not their identities but their necessary and possible connections such as "what is solid is extended" and "cogito ergo sum." It is by virtue of these relations that we escape from an endless series of mere tautologies and, through combining them, formulate the sets of simple ideas which underlie, *a priori,* the various sciences. In true Leibnizian spirit of the *ars characteristica,* the more we can analyze empirical concepts into simple ones and empirical

judgments into tautologies or possible combinations, the more our knowledge is *a priori*. The relations of simple ideas through comparison and combination are submitted to the criterion of thinkability (*Gedenkbarkeit,* like Crusius's inseparability—which Lambert calls combinability—and incompatibility), and each combination can be the *a priori* foundation of some science; each actual science can be submitted to the analytical discovery of what its simple, *a priori* ideas are. These simple ideas are called *Grundbegriffe*. Geometry is the science of simple ideas of extension in space; chronometry the science of simple ideas in duration; phoronomy the science of simple ideas in both space and duration; etc. The *Vernunftlehre*—science of the operations of the mind—depends on simple ideas of a thinking being and Locke's ideas of reflection. This gives rise to metaphysical knowledge which in point of certainty is on a par with geometry.[39]

Lambert and Crusius were the first among our philosophers to see the problematic aspect, yet also the extreme importance, of understanding necessary relations between simple ideas. No longer can the Wolffians equate impossibility with logical contradictoriness. Not all opposition is opposition of contradictories.[40] The necessity dependent upon the principle of contradiction is confined to the components of complex ideas, established by arbitrary definitions. It was the Wolffians' goal to show that all necessity was logical necessity, and all impossibility was logical incompatibility; but they failed to achieve it. To have seen the problem, which arises in trying to account for all necessities by means of identities, was the eminent contribution of Crusius and Lambert. Lambert confesses "that the *fons possibilitatis duos ideas combinandi* (the origin of the possibility of combining two [simple] ideas) has not been fully discovered."[41] It had hardly even been noticed, and it will not have been "fully discovered" until Kant will have generalized the problem into the question: How are synthetic judgments *a priori* possible?

Lambert himself attempted to find the *fons* of the necessary connections among simple ideas. There is in our minds, he held, an *actus reflexus,* a comparing of simple ideas which, in some unexplained way, gives rise to knowledge of their possible and/or necessary connections and combinations. Comparison is the fundamental *actus reflexus* of mind which is involved in analysis and synthesis of ideas.[42] In ways Lambert does not explain, out of the similarity and difference of simple ideas there issue necessary relational ideas, which indicate which simple ideas are validly synthesizable with others. This is not logical inference (where "synthesizable with" means "not contradictory to"); it involves an intuition, and in so concluding Lambert makes little or no progress beyond Crusius.

Nor were Lambert's efforts to avoid phenomenalism (and indeed solipsism) any more successful. Holding that possibility presupposes the

actual existence of something, Lambert fallaciously thinks that it must be existence *extra mentem*.[43] He eventually follows Malebranche in calling upon God to give metaphysical status to some of our ideas.[44] In spite of the influence of Locke and his proximity to Kant, Lambert is a metaphysician in the grand style, and his epistemological acuteness does not restrain his speculative passions.

Lambert's correspondence with Kant

Lambert published his *Cosmological Letters* in 1761. It has a rather curious history. It was a product of a sudden *aperçu* which Lambert had into the structure of the heavens. He saw analogies between planetary systems and galaxies. Kant had presented somewhat the same plan in his *Universal Natural History and Theory of the Heavens* (1755) but had introduced a cyclical evolutionary dimension on the origin and dissolution of astronomical structures. This theory is now known as the Kant-LaPlace hypothesis on the origin of the solar system. This classic in the history of astronomy was almost unknown at the time because of the bankruptcy of Kant's publisher. When Lambert read Kant's *Only Possible Premise for a Demonstration of the Existence of God* (1764), which contained a brief account of Kant's astronomical views, he wrote to Kant exculpating himself for the apparent plagiary, expressed contempt for the belletrist philosophers in Berlin, and invited Kant to enter a philosophical correspondence with him. Lambert really does philosophy in his letters and is anxious to involve Kant in his plans; Kant, always a reluctant letter writer, fills his letters with *politesse* but does not engage with Lambert in any serious philosophical rumination.

In September 1770, Kant sent Lambert a copy of his Inaugural Dissertation, *On the Form and Principles of the Sensible and Intelligible World*. In his covering letter (2 September 1770) he spoke of having "arrived at a position that, I flatter myself, I shall never have to change." Little did he know!

Lambert replied on 13 October in a long, somewhat repetitious letter which shows that he had a good understanding of Kant's Inaugural Dissertation. In it he disagreed with Kant on the nature of time and on the method to be followed in metaphysics.

The Kantian position to which Lambert objected was very briefly this. We have sensible representations of things as they appear to us (phenomena) and intellectual representations of things as they are in themselves (noumena). It is an error in philosophy to apply predicates of sensible knowledge to objects of intellectual representation; there is (in

Lambert's terminology) an absolute gap between ontology and phenomenology. Time and space are *a priori* forms of both pure and empirical sensible knowledge; therefore neither space nor time nor any predicates presupposing space or time may be applied to the reality of things as they are in themselves.

Lambert's most explicit objection was to the "unreal" state to which time was condemned in the Dissertation.[45] He tells Kant: "If time is unreal, then no change can be real…. Till now I have not been able to deny all reality to time and space, or to consider them mere images and *Schein*."[46]

To his regret, Kant did not answer Lambert's letter, but after Lambert's death in 1777[47]. he replied, in § 7 of the *Critique of Pure Reason,* saying: "I grant the whole argument. Certainly time is something real, namely die real form of inner intuition." If, on the other hand, we take time and space to be transcendentally real, the status of bodies in time and space is "degraded to mere illusion *(Schein)*" and "the good Berkeley cannot be blamed" for so degrading diem.[48] Kant's response to lambert in the *Critique* is to show that the transcendental reality of time, which lambert desiderated, leads to subjective idealism (illusionism) which lambert rejected.

Lambert's second major objection to the Inaugural Dissertation anticipated a major shift of view between the Dissertation and the first *Critique*. Anticipated, yes; occasioned, perhaps not, though we do not know. Lambert's assertion of continuity between phenomenology and ontology conflicted with what Kant called "the all-important rule" in metaphysical thinking: "Carefully prevent the principles proper to sensitive cognition from passing their boundaries and affecting intellectual cognition."[49]

This rule was rescinded in the *Critique of Pure Reason* in the famous sentence: "Thoughts without content are empty, intuitions without concepts are blind."[50] Here "content" means sensible intuitions, and Kant is here saying that no exertion of thought can produce knowledge if there is no sensible intuition. The most decisive factor in this reversal was Kant's discovery (aided no doubt by his reading of Tetens) that without sensible intuition there can be no synthesis of concepts and hence no judgments. The Inaugural Dissertation had kept separated what the first *Critique* would tightly bind together. So much, then, for Kant's thinking that he would never have to change what he thought in 1770!

Whether Lambert's *obiter dicta* had anything to do with this turnabout in Kant's thinking is doubtful, yet the weighty remark of a man Kant so much admired *may* have had an influence on him. Lambert says:

> It is also useful in ontology to take up concepts borrowed from appearance *(Schein)*, since the theory must finally be applied to

> phenomena again. For that is how the astronomer begins, with the phenomenon: deriving his theory of the construction of the world from phenomena, he applies it again to phenomena and their predictions in his ephemerides. In metaphysics, where the problem of appearance *(Schein)* is so essential, the method of the astronomer will surely be the safest.[51]

Could there here lie the seed of Kant's Copernican analogy?

TETENS

Johann Nicolaus Tetens was born in Schleswig in 1736 or 1738. His teacher at the University of Kiel, Johann Christian Eschenbach, was the German translator of Berkeley, and from him must have come much of the extensive knowledge of, and sympathy for, British philosophy which Tetens so obviously shows. Tetens was professor at Kiel from 1776 to 1789, when he entered the service of the King of Denmark. He had a distinguished career as a minister of finance until his death in 1807.

Tetens's empiridstic orientation

Tetens was sometimes alluded to as "the German Locke." He repeatedly says that "We must go back to the path trodden by Locke" and build on his "physiology *(Physic)* of the human understanding."[52] He thought that Locke's "plain, historical method" must be practiced, deriving all our ideas from experience. But he also thought that the British (especially Bacon, Locke, and Hume) had interpreted empirical knowledge as a mere collection of observations, had minimized the role of theory and logical form in their theories of knowledge, and had never been able to develop a systematic speculative philosophy or ontology. Reid, Oswald, and Beattie likewise had failed to develop an ontology which would enable them to systematize their common-sense philosophy, and this had kept them from penetrating very deeply into explanations of the mental process underlying common-sense knowledge and everyday practice. Tetens does not oppose the common-sense philosophers as he does Hume, but sees his own task rather to be that of securing and clarifying the philosophy of common sense. He is so committed to Locke, however, that he never concerns himself with Reid's opposition to "the new way of ideas," which is Reid's preeminent claim to historical importance. Tetens writes contentedly of

impressions and ideas just as if Reid had never thrown doubt on the entire movement from Descartes to its denouement in Berkeley, Hume, and unnamed "solipsists" in France.[53]

The possibility of metaphysics

In his *Universal Speculative Philosophy* Tetens asked the fundamental Kantian question: Is metaphysics possible? He asked: "Are the times right for systems of philosophy? Can one be more than an observing philosophical *raisonneur*?"[54]

Since Wolff, special metaphysics had been about either spiritual substances (God and the soul) or material substance. Rational theology, rational psychology, and rational cosmology each has its own fundamental concepts and principles, but they share some in common. Tetens calls the study of these common elements *transcendent philosophy* because it transcends the three divisions of special metaphysics.[55] It is first philosophy, ontology, *Grundwissenschaft*. Transcendent philosophy, however, is no longer to be the abstract, formal, almost lexicographical ontology of Wolff. It is, rather, epistemology (though the word did not exist in Tetens's lifetime). It is an empirical science, even though practiced in the armchair. What begins in the empirical sciences may end up in the *a priori* science of ontology.

When Tetens says, for instance, that "Nothing comes from nothing," he is formulating an *objectively necessary* principle of transcendent philosophy. But he sees the same judgment as an assertion of his reason, and he interprets it as an empirical proposition asserting only that his reason cannot think that something comes from nothing.[56]

How can this empirical, contingent judgment (even if true) serve (as it did for Crusius and Lambert as well as for Tetens) as a warrant for the objective principle expressed in the same words? For Tetens, the determination of the conditions of knowledge of the objective principle is itself an explicitly empirical task. Tetens believed that necessities of our mental operations, though discovered empirically, became necessities of transcendent philosophy. He asks us to consider whether "Nothing comes from nothing" is just a quirk of his individual mind; do others agree with him in asserting that nothing comes from nothing? These are all empirical questions that can be answered; but it is not obvious how a true and favorable answer to these questions has any standing when it is a question of ontology: *Can* something come from nothing?

Neither Crusius, Lambert, nor Tetens seems to have seen the problematical character of efforts to base the *a priori* claims of our

cognitions upon contingent facts of psychology. Kant characterizes such efforts as "getting water from a pumice stone." Let us see how Tetens proceeds.

The cognitive faculties

Tetens draws a line between the active and the receptive powers of the soul. The active power is the will and the faculty of thought; the receptive faculty is feeling or sense. Cognition occurs only when the former works upon the latter. The first product of this working is the capacity to form representations and concepts; there are already impressions of sense and feeling, but these are brought to consciousness as representations only by the basic power of making representations and concepts; a representation is the first object of consciousness, but it is not an impression or a copy of an impression. Thought is necessary to form a representation as a *sign* of sensation; the sensations must be "run through" and "held together" in a certain way[57] by thought before they become representations of an object. The power of imagination *(Dichtkraft)* creates generic images of sensible *abstracta* such as space and time. When representations refer to things in space and time which resumably give rise to them, we are said to perceive objects, and we il to notice that we have only representations of objects, not objects themselves. We identify and reidentify objects, associate them with one another, make abstractions from and classify them. In short, we obtain or form a concept of an object that can function in knowing in a way that a mere image cannot.

When representations become distinct concepts and their original felt association is replaced by a connection which is thought, there arises a concept of relation *(Verhältnissbegriff)* between concepts. Relational concepts are not confined to specific pairs of representations but may remain the same even when the specific content of the representations is different. Such concepts are the fundamental concepts of transcendent philosophy. Among them are sameness and difference, coexistence and succession (space and time), inherence of a property in a substance, and dependence of one thing on another (echoes of Hume's list of "philosophical relations," anticipations of Kant's categories). The relations among these concepts are *a priori,* because they are not restricted as to the empirical content of the representations related to each other. Since they are relations implicit in the formal structure of judgments and inferences, they are found in and apply to all knowledge.

We have seen repeatedly how Crusius and Lambert recognized a class of necessary judgments which are not based on logical necessity according

to the laws of identity and contradiction. They tried to establish the objectivity of such judgments. Generally, they tried to do so by appealing to the fact (if it is a fact) that these judgments express a necessity of thought, not a logical necessity: one *just must* see that some things cannot be thought to coexist. That, however, is a fallible, contingent truth if it is true at all. What they needed was a proposition with the apodeictic certainty of the law of contradiction yet one that could not be proved by the law of contradiction. (In a word, they needed to recognize what Kant will later call synthetic *a priori* judgments.)

Tetens was keenly aware of the problem in 1776. The truths of geometry are necessarily true, but not because they depend on identity and contradiction; they are necessarily true of space as we constitute the *abstracta* of space by the functioning of our cognitive faculties. The laws of identity and contradiction are "mere ways of thinking without reference to what is peculiar to the ideas related,"[58] but the laws of mathematics deal with what is peculiar to space and time. Where the necessity of a judgment does not depend on the merely formal relationship between subject and predicate or the particular empirical content of the two concepts, it must depend upon "what is, in respect to certain general classes of representations (or objects), necessary and natural to the understanding."[59] What the features are that are necessary and natural to the understanding must be discovered, according to Tetens, empirically, though the relations themselves are *a priori* necessary.

The objective reference of perception

It is a quite different thing to show that a judgment is an expression of thought natural to our understanding, and to show that the judgment is objectively true. Tetens made an original and significant change in the mode of examining this question of subjectivity and objectivity.

Sensations and impressions are not normally objects of consciousness. They lack referentiality or intentionality. They get intentionality from being ingredient in representations, representations in our consciousness being representations *of something*. Tetens claims that this is a better account of the origin of our belief in external, independent objects than the different ones offered by Hume and Reid. But he also confesses,[60] however, that it does not touch the question: *Is objective reference veridical?*

Tetens does not have an answer to the demand for justification of objective knowledge-claims, regarded as a question of metaphysics. Epistemologically, however, he gives a criterion of objectivity which is independent of the ontological status of minds and objects.

Tetens examines the way some ideas are endowed with objective reference without presupposing an answer to the question of the ontology of subject and object. He empirically distinguishes the *unchangeable subjective* and the *changeable subjective*,[61] and sees that the former captures the empirical and methodological, if not the ontological, meaning of "objective." Similarly there is the distinction between the *intersubjective* and the *subjective,* where the former is *ordinarily* called the objective.

This is as close as a writer of an empirical theory of knowledge can come to the Kantian divisons between judgments of perception and judgments of experience and between unattainable knowledge of transcendent objects and attainable knowledge of objects immanent in experience.

Kant's friend Hamann said that Kant had Tetens open upon his desk while writing the *Critique of Pure Reason*. Kant regretted that this powerful and original thinker did not review his *Critique of Pure Reason* when it was published in 1781. We can be sure that the second edition (1787) would have been improved if Kant had had the benefit of Tetens's criticisms. There is a certain melancholy in some of Kant's remarks about Tetens—how close he had come to what Kant saw as truth, and yet how far short of it he had fallen. He wrote:

> Tetens investigated the concepts of reason subjectively, I objectively. His analysis is empirical, mine transcendental. No one considered the possibility of such *a priori* knowledge [ingredient in and presupposed by empirical knowledge] although Herr Tetens could have given rise to it.[62]

THE MENDELSSOHN-JACOBI CONTROVERSY[63]

The philosophers we have been studying raised objections to Wolff's philosophy, but with the possible exception of Crusius they did not bring much against his *Weltanschauung*. They were all men of the Enlightenment. They all were quite "safe" on the big issues of philosophy—God, freedom, and immortality—while they disputed technical points such as the logical status of the principle of sufficient reason.

A little after 1780 the *pax philosophica* was shattered by a controversy that left its mark on Kant, Herder, Goethe, and the early German Idealists such as Schelling. It was a turning point in German philosophy and

cultural life. If one decides that Jacobi was the "victor," one can say that the Enlightenment in Germany was finished.

Moses Mendelssohn was a faithful disciple of Wolff and won the prize essay contest of the Berlin Academy by defending the Wolffian mathematical ideal, defeating Immanuel Kant. Kant praised the elegance of his literary style, and in fact he is the best stylist among German philosophers before Schopenhauer. He was an intimate friend of Lessing's and was the model of the wise man in Lessing's drama, *Nathan der Weise*.

Friedrich Heinrich Jacobi was born into a rich Pietistic family in Düsseldorf in 1743. He reacted against the naturalistic, empiricistic education he received in Switzerland and became a religious enthusiast *(Schwärmer)*. Faith and feeling were the watchwords of his philosophy.

The conception of Spinoza as an atheist or pantheist, a blind fatalist, a destructive critic of Scripture who denied its authority, and a revolutionary political thinker was almost universally accepted in Germany. Wolff wrote extensively in criticism of Spinoza,[64] but nonetheless he was accused of Spinozism by his Pietist colleagues at Halle. Mendelssohn in his *Philosophical Conversations* (1763) pleaded for a better and more fair-minded appraisal of "the accursed atheist of Amsterdam," without, of course, taking any step that committed him to Spinozism and without effecting any change in the almost unanimous condemnation of Spinozism.

Imagine the shock, then, when it became known shortly after his death in 1781 that *Lessing had been a Spinozist*. Lessing—Germany's greatest man of letters, Germany's greatest thinker between Leibniz and Kant, a man whose character after more than two centuries still awakens feelings of affection and respect—a *Spinozist*? In conversations with Jacobi, Lessing had made this confession. Through mutual friends Jacobi imparted this information to Mendelssohn, ostensibly to contribute to a biography of Lessing that Mendelssohn was working on. Naturally the secret could not be kept; party lines were drawn.

There was a complicated exchange of letters through intermediaries, some of whom egged on one or the other of the protagonists. Finally there were publications in which spleen was hardly covered by civility: Jacobi's *On the Doctrine of Spinoza, in Letters to Moses Mendelssohn* (1785), Mendelssohn's *Morning Lessons or Lectures on the Existence of God* (1785), Mendelssohn's *To the Friends of Lessing* (posthumous, 1786), and Jacobi's *Against Mendelssohn's Accusations in his "To the Friends of Lessing"* (1786). To these should be added *David Hume on Belief* (1787) since it develops Jacobi's "philosophy of faith and feeling" which underlies the conversations with Lessing and the correspondence with Mendelssohn.

Nothing shows better the ill-nature of this controversy than the accusations that Jacobi was responsible for Mendelssohn's death in 1786 at the climax of the debate.

For three reasons what might have been a quiet *Auseinandersetzung* between two scholars was raised to the level of a public scandal. The first was the eminence of the recently deceased Lessing. Any surprising secrets about that good and famous man were bound to be objects of public curiosity. Second, there were many who hoped it was true that Lessing had been a Spinozist. These crypto-Spinozists were more numerous than anyone had reckoned, and with Lessing's Spinozism established they could come out of the closet.

Then there were the personal motives and traits of the principals. Fritz Jacobi was a name-dropper and a tuft-hunter. He prided himself on knowing everybody. (Goethe told Eckermann that Jacobi lacked something necessary for a poet or philosopher, but that he would have made a good ambassador.) Pride and snobbery were mixed in him with a genuine religious concern.

Mendelssohn was not shocked by Spinozism, as we have already seen. But it was a personal wound to him that Lessing, his intimate friend of thirty years, should have concealed his Spinozism from him and revealed it to some young man he hardly knew. At first he doubted the truth of what Jacobi said about Lessing; then he doubted the truth of what Lessing may have said about himself, citing as explanation Lessing's love of paradox, irony, and persiflage.

Much has been written about the strategy and tactics of the contestants, detailing how Jacobi laid traps for Mendelssohn, how these were dodged by Mendelssohn who was laying traps of his own, etc. Neither of the principals came out with clean hands. The stakes were too high for either man to be punctilious about the ethics of publication of personal documents. The stakes were the validity of the whole philosophical enterprise.

Jacobi saw the issue as a choice between the nihilistic Spinoza-Leibniz-Wolffian Enlightenment and the absolute but irrationalistic claims of faith and feeling. Jacobi's target was something even bigger and grander than Lessing and Spinoza: he aimed to overthrow the Enlightenment's rationalism and intellectualism and ideal of demonstrable metaphysical and theological truth. He tried to show that any system of demonstrations had to go in the direction of Spinozism; minor criticisms of Wolff had to give way to a frontal assault on the entire enterprise of philosophy as an intellectual discipline. Mendelssohn's strategy was to construct a form of Spinozism which Lessing *might* have held and which did not have the fatal consequences that Jacobi had found in his interpretation of Spinoza. In this way he could free the Leibniz-Wolffian philosophy of the atheism, pantheism, nihilism, and fatalism that Jacobi said it shared with Spinoza.

When Lessing remarked of Spinoza's substance "that we can think nothing about it doesn't imply its impossibility," Jacobi replied: "You go

even farther than Spinoza. For him understanding is worth more than anything." Lessing replied: "For men only. Spinoza was far from thinking our miserable human acting for purposes was the best method, and far from making thought supreme."[65]

After an *excursus* in which Jacobi tries to show that Leibniz and hence the Leibniz-Wolffians were in essential agreement with Spinoza, Jacobi returns to his theme of the impotence and inferiority of abstract thought:

> In my judgment the greatest service of the enquirer is to uncover and reveal being *(Daseyn)*. Explanation is only the means and the way to the goal; it is neither the next nor the ultimate goal. The final goal is what does not let itself be explained: the irresolvable, the immediate, the simple…. Since we only put together and hang together what is explainable in things, there is a certain illusion *(Schein)* in the soul which blinds more than it reveals…. [When we enquire] we close the eye of the soul with which the soul sees itself and God, so that by greater concentration it can see with the eye of the body.[66]

We do not, therefore, approach truth by rational thinking; rather, we embrace it in spite of rational thinking. A *mortal leap (salto mortale)* is needed. (An almost exactly parallel move can be found in Kierkegaard's distinction between approximation to the truth and appropriation of the truth.) But Jacobi was unable to persuade Lessing with his "tired head and old legs" to take the plunge; Lessing remained a Spinozist. Others who professed adherence to Spinozism, however, embraced a very different Spinozism from that of rationalism and geometrical rigor. For men like Herder,[67] Schelling, and Goethe, an organic, holistic, romantic conception of oneness replaced the quasi-mathematical perfection of Spinoza's substance. Spinoza came into his own, paradoxically, when rationalism was on the wain.

Having held Spinozistic nihilism (Jacobi's own word) to be the natural and inevitable last stage in the evolution of Enlightenment, it was to be expected that Kant's *Critique of Pure Reason*, published the year of Lessing's death, should come under criticism from Jacobi. But instead of appealing directly to religious "faith and feeling," he allied himself with David Hume. He appealed to Hume and to Hume's critic, Thomas Reid, to justify his doctrine of the impotence of reason even in the simplest actions of everyday life. Hume substituted belief for unattainable knowledge, and Reid found belief essential in establishing the existence of external objects when all that analytical reason could show was only impressions and ideas.

In his *Morning Lessons (Morgenstunden)* (1785) Mendelssohn does two things. First, he reasserts the correctness of Wolff 's deism and its superiority over Spinoza's pantheism. He points out what seems to him to

be a myriad of errors in Spinoza's philosophy. He shows, to his own satisfaction, that the demonstrative method does not necessarily produce the Spinozistic conclusions of pantheism and fatalism.[68]

Second, he formulates, in the name of his friend Lessing, a system of "purified pantheism" which Lessing might have held and which would not have the evil consequences that Jacobi thought were indigenous in Spinozism. Specifically, in the fourteenth Lesson he makes of substance a spiritual being endowed with intellect and will but not extension. Then the question whether God is the world (pantheism) or the world stands outside God (deism) does not have the portentous consequences which follow from identifying the human mind with a mode of substance whose essence is necessity, extension, and oneness.

In his *To the Friends of Lessing* (1786) Mendelssohn tries a new gambit. He commends "sound human understanding" (common sense in the Scottish philosophy) when high speculations like Spinozism or purified pantheism, formulated by fallible human reason, conflict or do not carry conviction. He says:

> When I speak of rational conviction... I am not speaking of metaphysical argumentation...or of scholastic demonstrations which have stood the test of the most subtle skepticism; rather, I speak of the expressions and judgments of simple and sound human understanding which directly grasps and contemplates things. I certainly respect demonstrations in metaphysics... but *my* conviction of religious truths does not depend so completely upon metaphysical argumentations that it would have to stand or fall with them. One can raise doubts about my arguments and show fallacies in them, and yet my conviction remains unshaken.... For the true and genuine conviction of natural religion...these artificial methods [of metaphysical speculation] are of no use. The man whose reason is not debauched by sophistry needs only to follow his own good sense.[69]

This was the state of things at the end of the Mendelssohn-Jacobi dispute: the proponent of faith and feeling sees his rationalist enemy take refuge in common sense. On both sides, reason has taken a beating. That is how it appeared to one man, Immanuel Kant, in an apostrophe to Jacobi and Mendelssohn:

> Men of intellectual power and broad minds! I honor your talents and love your feeling for humanity. But have you considered what you do, and where you will end, with your attacks on human reason?...Friends of the human race and of that which is holiest to it!...do not wrest from reason that which makes it the highest good

> on earth, the prerogative of being the ultimate touchstone of truth.[70]

German Idealism proper may be said to have begun when leading philosophers heeded Kant's words and made reason "the highest good on earth" and "the ultimate touchstone of truth."

NOTES

1 See, for instance, C.A.Corr, "Christian Wolff and Leibniz," *Journal of the History of Ideas,* 36 (1975): 241–62.
2 W.H.Bruford, *Germany in the Eighteenth Century* (Cambridge: Cambridge University Press, 1965), p. 222.
3 Wolff's *Gesammelte Werke,* ed. J.Ecole, J.E.Hofmann, *et al.* (Hildesheim: Olms, 1962–), are currently being published, but there is little Wolff in English. There is *Preliminary Discourse on Philosophy in General,* trans. R.G.Blackwell (Indianapolis: Bobbs-Merrill, 1963); selections from *Vernünftige Gedanken von Gott, der Welt, der Seele des Menschen, auch allen Dingen überhaupt* in *Eighteenth Century Philosophy,* trans. L.W.Beck (New York: Free Press, 1966); selections from *Vernünftige Gedanken von der Menschen Thun und Lassen* in *Moral Philosophy from Montaigne to Kant,* trans. J.B.Schneewind (Cambridge: Cambridge University Press, 1990).
4 See T.Frangsmyr, "Christian Wolff's Mathematical Method and its Impact on the Eighteenth Century," *Journal of the History of Ideas,* 36 (1975): 653–68.
5 Wolff, *Preliminary Discourse on Philosophy in General,* op. cit., §139.
6 Wolff, *Von dem Unterschiede metaphysischer und mathematischer Begriffe…,* in *Gesammelte Werke,* op. cit., Series I, Vol. 22, pp. 286–343, esp. § 14.
7 J.Ecole, "En quel sens peut-on dire que Wolff est rationalist?" *Studia Leibnitiana,* XI (1979): 45–61.
8 Wolff, *Prima Philosophic sive Ontologia,* in *Gesammelte Werke,* op. cit., Series I, Vol. 2, §§ 70, 288–319; *Vernünftige Gedanken von Gott…,* op. cit., § 30. Wolff's "deductions" are so patently question-begging that it is not worthwhile repeating them.
9 Wolff, *Preliminary Discourse on Philosophy in General,* op. cit., §§ 7 ff.
10 Wolff defines *a priori* as follows: "Whatever is known *a priori* is elicited by the power of the intellect." "Whatever becomes known to us by ratiocination is said to be known *a priori.*" *Psychologia Empirica,* in *Gesammelte Werke,* op. cit., §§ 438, 434.
11 Wolff, *Ontologia,* op. cit., § 174; *Vernünftige Gedanken von Gott…,* op. cit., §14. Kant's rejection of the complement of possibility is in *Critique of Pure Reason,* A 231, B 284. On this difficult point, see C.A.van Peursen, "Wolff's Philosophy of Contingent Reality," *Journal of the History of Philosophy,* 25 (1987): esp. 75–6.
12 Wolff, *Ontologia,* op. cit., § 872.
13 Wolff tediously recites the benefits that earth-dwellers enjoy by virtue of the sun's existence, e.g. without the sun there could be no sundials and we could not detect compass deviations. What about suns (i.e. stars) that do not benefit

earth-dwellers? There must be inhabitants of their planets, who do benefit from their suns. See also the exciting chapter on the benefits we have from the existence of air. *Vemünftige Gedanken von der Absicht der natürlichen Dingen,* in *Gesammelte Werke,* op. cit., §§ 28, 44, 46, 60, 85, 91, *et passim.*

14 Kant, *Critique of Practical Reason,* trans. L.W.Beck (New York: Macmillan, 1993), P. 41.s

15 Baumgarten's Latin Wolffian textbooks were used by Kant in his lectures. One book has been translated into English under the name *Reflections on Poetry,* trans. K.Aschenbrenner and W.B.Holtker (Berkeley: University of California Press, 1954).

16 Crusius, *Weg zur Gewissheit und Zuverlässigkeit der menschlichen Erkenntnis* (1747), §§ 5, 9, 10 (hereafter referred to as *Logic*); *Entwurf der notwendigen Vernunftwahrheiten* (1745), § 234 (hereafter referred to as *Metaphysics*). All citations are to *C.A.Crusius, Die philosophischen Hauptwerke,* ed. G.Tonelli, 4 vols (Hildesheim: Olms, 1987).

17 Crusius, *Metaphysics,* op. cit., § 14.

18 Ibid., §§ 56, 57. This startling thesis was accepted by Lambert and by the precritical Kant in his *Only Possible Premise for a Demonstration of the Existence of God,* trans. G.Treash, Part I, Observation 2 (New York: Abaris, 1979), p. 69; also *New Exposition of the First Principles of Metaphysical Knowledge,* in *Kant's Latin Writings,* 3rd edn (New York: P.Lang, 1993), p. 52.

19 Crusius, *Logic,* op. cit., § 62. Kant does not believe that the Crusian distinction permits an escape from psychological subjectivity.

20 All of these laws except the first two are rejected as "subreptitious axioms" in Kant's Inaugural Dissertation. They result from the application of sensible concepts to intelligible objects and are therefore invalid.

21 Crusius, *Metaphysics,* op. cit., §15.

22 Kant's letter to Herz, 21 February 1772, in *Kant's Philosophical Correspondence,* ed. A.Zweig (Chicago: University of Chicago Press, 1967), pp. 72–3. Crusius may have been the target of Kant's attack on "preformationism" in *Critique of Pure Reason,* B 167–8; see G.Treash, "Kant and Crusius: epigenesis and preformation," *Proceedings of the Sixth International Kant Congress,* II (1989): 95–108.

23 Crusius, *Logic,* op. cit., § 185.

24 Crusius is closer to Hume when he speaks of "feeling a compulsion to grant another thing from which one thing comes" (*Metaphysics,* op. cit., § 63) but does not draw Hume's skeptical conclusion.

25 Crusius, *Metaphysics,* op. cit., § 31.

26 This is the principal theme of Kant's *Essay towards Introducing Negative Magnitudes into Philosophy* (1764), the work that shows more than any other the Crusian influence on Kant.

27 Crusius, *Dissertatio philosophica de usu et limitibus principii rationis determinantis, vulgo sufficientis,* §§ II, III.

28 Crusius, *Anweisung vernünftig zu Leben* (1744), § 175.

29 Kant, *Critique of Practical Reason,* op. cit., p. 41.

30 Crusius, *Anweisung vernünftig zu Lehen,* § 176.

31 Lambert, *Anlage zur Architektonic,* § 683. This work, published with Kant's aid in 1765, aimed to be an ontology for all the sciences, but it lacks the architectonic, systematic order which might have come from the successful

application of Lambert's adaptation of Leibniz's *ars characteristica*. It is to be found in Lambert's *Philosophische Schriften,* ed. H.W.Arndt (Hildeshcim: Olms, 1965), Vols 3 and 4.

32 Lambert, "On the Improvement of Method of Proof in Metaphysics, Theology, and Morals," p. 5. This was an uncompleted draft of a paper Lambert apparently intended to submit to the Berlin Academy in the prize competition of 1762. It was first published as the *Kant-Studien Ergänzungsheft* (1918). It shows some remarkable kinship with Kant's prize essay.

33 Lambert to Kant, 3 February 1766, in *Kant's Philosophical Correspondence,* op. cit., p. 51.

34 Lambert, *Abhandlung von Criterium veritatis* (1761), § 79, first published in *Kant-Studien Ergänzungsheft,* 36 (1915).

35 Joachim Georg Darjes (1714–63), professor in Jena and later in Frankfurt/Oder; originally a disciple of Wolff, he was influenced by Crusius. The quotation is from Lambert, *Anlage zur Architektonic,* op. cit., § 11.

36 Lambert, *Neues Organon,* Dianoiologie, §§ 601–5. This work was published in two volumes in 1764 and is reprinted as Lambert's *Philosophische Schriften,* op. cit., Vols 1 and 2.

37 Ibid., § 639.

38 Ibid., §§ 656–7.

39 Ibid., Dianoiologie, § 662.

40 This is the subject matter of Kant's *Essay towards the Introduction of Negative Magnitudes in Philosophy,* written under the Crusian influence before Kant had read Lambert.

41 Lambert, *On the Improvement of the Method…*, op. cit., § 19 *μ;* see Lambert, *Abhandlung von Criterium veritatis,* op. cit., § 92.

42 Ibid., *notanda* 4.

43 Lambert, *Anlage zur Architektonic,* op. cit., § 297.

44 Lambert, *Neues Organon,* op. cit., Alethiologie, § 234a.

45 See L.Falkenstein, "Kant, Mendelssohn, Lambert, and the Subjectivity of Time," *Journal of the History of Philosophy,* 29 (1991): 227–52.

46 *Kant's Philosophical Correspondence,* op. cit., pp. 63, 66.

47 Until Lambert's death it had been Kant's intention to dedicate the *Critique of Pure Reason* to him.

48 Quotations from Kant, *Critique of Pure Reason,* A 37, B 53, B 71.

49 Kant, *On the Form and Principles of the Sensible and the Intelligible World,* § 24, in *Kant's Latin Writings,* op. cit., p. 148.

50 Kant, *Critique of Pure Reason,* A 51=B 75.

51 *Kant's Philosophical Correspondence,* op. cit., p. 65.

52 Tetens, *On Universal Speculative Philosophy* (1775), pp. 57, 66–7, in Tetens, *Philosophische Versuche über die menschliche Natur und ihre Entwickelung* (Berlin: Kant Gesellschaft, 1913). Both of Tetens's works cited are included in this volume.

53 The pervasive influence of the Scots on Tetens has been studied by M.Kuehn in his comprehensive *Scottish Common Sense in Germany, 1768–1800* (Montreal: McGill-Queen's University Press, 1987), ch. 7.

54 Tetens, *On Universal Speculative Philosophy,* op. cit., p. 66.

55 Ibid., p. 40. A like use of "transcendent" is found in Lambert (*Neues Organon,* op. cit., Alethiologie, § 48; *Anlage zur Architektonic,* op. cit., § 301). "Transcendent" is not to be confused with Kant's "transcendental."

56 Tetens, *On Universal Speculative Philosophy,* op. cit., p. 27. There is a marked resemblance to Crusius here.
57 Kant, *Critique of Pure Reason,* A 99.
58 Tetens, *On Universal Speculative Philosophy,* op. cit., pp. 33–4.
59 Ibid., p. 28. Tetens accepts Kant's distinction between the necessity inherent in intuition and that belonging to "the transcendent principles of reason." Thus he is at one with Kant in asserting the discontinuity of mathematical and metaphysical reasoning, citing Kant's Inaugural Dissertation. See ibid., pp. 21–2 n.
60 Tetens, *Philosophical Essays* (1777), in *Philosophische Versuche*..., op. cit., p. 393.
61 Ibid., p. 527
62 *Kants gesammelte Schriften,* 29 vols, ed. Deutsche (formerly Königliche Preussische) Akademie der Wissenschaften (Berlin: de Gruyter [and predecessors], 1902–), Reflexion 4901, and Vol. 23, pp. 23, 57.
63 The best collection of documents is H.Scholz (ed.), *Die Hauptschriften zum Pantheismusstreit* (Berlin: Kant Gesellschaft, 1916). Selections from Scholz have been translated as *The Spinoza Conversations between Lessing and jacobi,* trans. G.Vallée *et al.* (Canham, Md: University Press of America, 1988).
64 Wolff, *B.von S.Sittenlehre widerleget von...Christian Wolff* (Leipzig, 1744); *Theologia naturalis* (1749), Vol. II, §§ 671–716.
65 *The Teaching of Spinoza in Letters to Moses Mendelssohn,* in Scholz, op. cit., pp. 82–3.
66 Ibid., p. 91.
67 See, for example, Herder's *God, Some Conversations* (1787) (New York: Hafner, 1940).

CHAPTER 2

Kant's Copernican revolution

Daniel Bonevac

Immanuel Kant's *Critique of Pure Reason* was to transform the philosophical world, at once bringing the Enlightenment to its highest intellectual development and establishing a new set of problems that would dominate philosophy in the nineteenth century and beyond. As Richard Rorty has observed, Kant would turn philosophy into a profession, if for no other reason than that, after 1781, one could not be called a philosopher without having mastered Kant's first *Critique*—which, in the words of Kant's famous commentator, Norman Kemp Smith, "is more obscure and difficult than even a metaphysical treatise has any right to be."[1]

The *Critique's* central character is "Human reason," which, Kant begins his first edition's preface by noting,

> has this peculiar fate that in one species of its knowledge it is burdened by questions which, as prescribed by the very nature of reason itself, it is not able to ignore, but which, as transcending all its powers, it is also not able to answer.
>
> (A vii)[2]

Reason develops principles to deal with experience; within the realm of experience, those principles are well justified. Reason finds itself driven, however, to ask questions extending beyond that realm. The very principles it has developed and upon which it properly continues to rely in dealing with experience there lead it "into darkness and contradictions" (A viii). Metaphysics, once Queen of the Sciences, now surveys the battlefield on which these principles clash and mourns. Kant's aim in the *Critique* is to rescue metaphysics, "to secure for human reason complete satisfaction" (A 856, B 884) by defining its proper sphere of application.

Kant's means for achieving this end is the critical method. The title of the work is ambiguous in both English and German: Pure reason may be the agent or the object of the critique.[3] In fact, it is surely both. The critical method requires reason to critique itself, to determine its own limits, and then to devise rules for staying within them. This, Kant thinks, is the key to reason's "complete satisfaction": "there is not a single metaphysical problem which has not been solved, or for the solution of which the key at least has not been supplied" (A xiii).

Understood in this way, Kant's critical method hardly seems revolutionary. It had been exemplified already in Locke's *Essay concerning Human Understanding* and Hume's *Treatise of Human Nature*. Both were attempts to define the limits of human knowledge by employing reason in a reflective act of self-criticism. Kant's most important contribution is not the general idea of the critical method, but the specific form that method takes, for which he often uses the adjective *transcendental* rather than *critical*. Kant claims that he uses the transcendental method and establishes the truth of transcendental idealism.

What, then, is the transcendental method? To understand it, we need to focus on what, in the preface to the second edition of 1787, Kant considers the key to his advance: his Copernican revolution in philosophy. "[T]he procedure of metaphysics," Kant writes, "has hitherto been a merely random groping, and, what is worst of all, a groping among mere concepts" (B xv). Kant finds himself capable of setting metaphysics upon the secure path of a science by advancing a hypothesis analogous to that of Copernicus.

> Hitherto it has been assumed that all our knowledge must conform to objects. But all attempts to extend our knowledge of objects by establishing something in regard to them *a priori,* by means of concepts, have, on this assumption, ended in failure. We must therefore make trial whether we may not have more success in the tasks of metaphysics, if we suppose that objects must conform to our knowledge.
>
> (B xvi)

Copernicus explained the motions of the heavenly bodies as resulting, not just from their own motion, but also from the motion of the observers on earth. Just as he sought "the observed movements, not in the heavenly bodies, but in the spectator" (B xxii n.), so Kant seeks the laws governing the realm of experience not in the objects themselves but in us: "we can know *a priori* of things only what we ourselves put into them" (B xviii).

THE PLATONIC HERITAGE

Kant is a rationalist. We might define a *concept rationalist* as one who believes in innate concepts—that is, that we have first-order cognitive abilities that we do not derive from experience—and a *judgment rationalist* as one who believes that we can know some synthetic truths *a priori* that is, that we can know independently of experience some truths that are not merely linguistic or verbal, that are not automatically true or false because of the meanings of the words that constitute them. Kant is plainly a rationalist in both senses. He argues that we can deduce pure concepts of the understanding *a priori,* independently of experience, from the mere possibility of experience, and moreover that there are synthetic *a priori* truths—that is, truths that we can know independently of experience but that are not merely verbal. Indeed, the establishment of rationalism in both senses seems to be a major goal of the *Critique.*

Like many rationalists, Kant understands himself as working within the Platonic tradition. The central problems he attacks and his solutions to them stem directly from that tradition. To understand Kant's Copernican revolution, therefore, we must consider the framework in which his thought is embedded.

Consider a judgment of perception, for example, (said pointing to a figure drawn on a blackboard) 'This is a triangle.' According to Plato, at one very influential stage of his thought, at least, the mind so judging is Janus-faced. It is turned toward a perceptual object, a triangle, if it judges correctly. It is also turned toward the abstract form of a triangle. Both the object and the form have real causal or explanatory power. The object is causally responsible for our perception of it. But we are able to perceive it as a triangle because we apprehend the general form of triangularity. The form of a triangle is exemplified in the triangle itself, which in turn is an instance of, or, in Plato's technical language, *participates* in, the form.

The forms constitute the most distinctive feature of Plato's philosophy of mind. They explain our ability to think general thoughts; they account for regularities as well as changes in experience; they explain how different people (or the same person at different times) can think the same thought; and they explain how thoughts can be veridical. We may think general thoughts, for example, by thinking about the forms and how they relate. Regularities in experience involve constant relations of forms; changes occur when an object of sense stops participating in one form and begins participating in another. Two different people can think the same thought by attending to the same forms. Finally, thoughts can depict reality accurately by involving the forms that are actually instantiated.

But the forms also generate a serious epistemological puzzle. By

definition, the forms are not themselves objects of experience; we do not perceive triangularity as we perceive individual triangles. How, then, do we know anything about them? How is the realm of forms, which Philo of Alexandria later termed "the intelligible world," intelligible? In an Aristotelian philosophy of mind, we generate our own general concepts from experience through a process of abstraction. A Platonist may borrow this account for certain general concepts, but cannot use it for all, because it is central to Platonism that some forms are ultimately responsible for our abilities to think the corresponding thoughts. On Plato's view, we do not abstract the idea of a pure triangle from triangular objects we perceive; indeed, we never encounter a pure triangle in experience. Instead, we recognize objects as triangular because we apprehend the form of pure triangularity and recognize that the objects approximate that pure form. In this sense, the forms have causal power; we are able to think of things as triangular by virtue of our apprehension of the form.

Unfortunately, Plato has no theory that explains our interaction with the forms. He relies on two metaphors. In the *Meno,* he speaks of recollection; we apprehend the forms by recalling a time before birth when our souls were united with them. In the *Republic,* he speaks of the form of the Good as analogous to the sun, shedding light on the realm of forms and making possible our apprehension of them. Neither metaphor yields a satisfactory theory within the limits of Platonic metaphysics. Neither, moreover, seems to explain our apprehension of forms without begging the question. The *Meno* metaphor explains the causal efficacy of the forms now by appealing to their efficacy at some earlier time; the *Republic* metaphor, by appealing to the efficacy of the form of the Good. The Neoplatonic theory of emanation, according to which the entire realm of forms is ordered, with the causal efficacy of higher levels making lower levels possible and intelligible, does little to change the central epistemological difficulty.

Augustine, however, solves Platonism's epistemological problem by going beyond the resources of the original theory. To put it crudely, he adopts the *Republic's* solution, but replaces the form of the Good with God. It is not clear why the form of the Good should be more causally efficacious than any other form. Causal efficacy, in contrast, is not a problem for God, who can do anything. Augustine thus follows Philo in identifying the forms with ideas in the mind of God, and describes the process by which we apprehend the forms as illumination, an act of revelation by which God allows us to make use of a portion of divine mental resources and by which, therefore, God makes our minds resemble the divine mind. We have innate cognitive capacities that reflect the principles according to which God created the world.

Platonism remained Augustinian throughout the medieval debates

concerning realism and nominalism arising from the conflict between Platonic and Aristotelian theories of substance and knowledge. Descartes, however, advanced a new kind of skeptical argument that forced a change in Platonism and that brought the theory of knowledge to center stage in modern philosophy. He added to the traditional arguments of Sextus and Cicero the possibility of an evil deceiver, who systematically misaligns our minds to reality. This extends farther than traditional skeptical arguments, for it raises the possibility that not only sensible knowledge but even logic and mathematics might be mistaken. It thus challenges the Augustinian solution to Platonism's epistemological problem. Why should illumination produce veridical knowledge? Why should we believe that God reveals the portion of the divine mind relevant to the construction of the world, and not some counterfeit of it? Why should our innate ideas, and the *a priori* knowledge arising from them, have anything to do with the world?

Kant sees the force of this difficulty, and thinks that, within the Platonic framework, it is insoluble. He divides previous philosophers into dogmatists and skeptics (A ix; A 856, B 884). Dogmatists like Descartes and Leibniz assume that human reason can comprehend ultimate reality. Their dogmatism involves three factors:

1 *Realism*. Human thought can discover the nature of objective reality.
2 *Transcendence*. Real knowledge is capable of extending beyond experience to the supersensible. (See A 295–6, B 352.)
3 *Rationalism*.[4]

Descartes, for example, tries to demonstrate that God guarantees the veridicality of our *a priori* judgments by arguing that God exists and is entirely good. A good God, surely, would not be a deceiver. Granting Cartesian rationalism, we may see the problem generated by the possibility of the evil deceiver as precisely that of realism: Why should we believe that our thinking can discover the nature of objective reality? Descartes's solution relies on transcendence. We may take the form of thought implicit in the *cogito,* namely, the method of clear and distinct ideas, and apply it beyond the realm of our own thinking to reality—indeed, to reality that transcends all possible experience. But this, Kant sees, is just what is at issue. If realism is false—if our minds cannot discover the nature of objective reality—then why should we expect our modes of thinking, applied to the nature of that reality, to be reliable? It will not do to appeal to transcendence to justify realism, for the only argument for transcendence presupposes realism. For example, Descartes's third *Meditation,* arguing for the existence and moral excellence of God, appeals to the premise that there is at least as much reality in the cause as in the effect.[5] Why, given only the certain knowledge that I think and I exist, should I accept this principle as

certain? Descartes derives it by applying the method of clear and distinct ideas beyond the mental realm of the *cogito,* which first justified it, to the realm of external, objective reality. Kant, for this reason, among others, rejects Descartes's proof. But his reasoning is broader. Any argument for realism within the dogmatist's framework will rely on transcendence and make a similarly illegitimate move.

Skepticism, as Kant conceives it, also involves three factors:

1 *Subjectivism*. Knowledge of objects reduces to knowledge of sense.
2 *Immanence*. Real knowledge is limited to the sphere of sense experience.
3 *Empiricism*. (The denial of rationalism in either of its forms.)

Skepticism, too, encounters difficulties. If dogmatism extends our knowledge too far and too uncritically, skepticism seems unable to account for the knowledge we do have. Hume's scandal of induction, for example, illustrates that we cannot justify any causal knowledge we claim to have. It would have to reduce to a knowledge of items directly presented in sensation, but, as Hume shows, it does not.

Kant's critical philosophy shares the immanence of skepticism, but also the rationalism of dogmatism. It transcends the distinction between realism and subjectivism, holding that in a sense each is correct. Kant's synthesis of dogmatism and skepticism comes at the cost of distinguishing between the world of appearance—the *phenomenal* world—and the world of things-in-themselves—the *noumenal* world. The former is essentially sensible, and human thought can discover its nature. Things-in-themselves, in contrast, lie beyond our cognitive capacities. The dogmatist is right about the possibility of knowledge of objects, even *a priori* knowledge of them; the skeptic is right about the limitation of knowledge to the realm of experience.

Both, however, misunderstand the status of objects of experience, thinking that they are in themselves as they appear to us. The phenomenal world is both sensible and knowable; the noumenal world is neither. With respect to phenomena, therefore, the skeptic is vanquished; we can have *a priori* knowledge of objects of experience. With respect to noumena, however, the skeptic triumphs, for we can have no knowledge of things-in-themselves.

Kant's solution to the epistemological problem of Platonism goes beyond the distinction between phenomena and noumena. It would be easy to build that distinction into Descartes's metaphysics, for example, without thereby making any headway on the skeptical problem. The key to Kant's solution resides in two additional changes to the traditional framework. First, Kant explains the causal efficacy of the forms by

transforming them into *categories,* pure concepts of the understanding. They are innate cognitive capacities of a very general kind, but they are wholly mental; the question of their correspondence to abstract, mind-independent forms cannot arise. Without such forms there remains, of course, the possibility that the categories do not correspond to objective and concrete reality. So, second, Kant reverses the traditional conception of the relation between thought and its object, or, as he puts it, between object and concept. The Platonist traditionally sees the object as causally responsible for the veridical, perceptual thought of it. Kant's Copernican revolution is precisely to reverse this understanding, maintaining instead that thought is causally responsible for constituting the object. The result is not anarchy, a circumstance of "thinking making it so," for the constitution of objects proceeds according to the categories in a rule-governed way. The rule-governed character of the construction makes knowledge of objects possible. More, it makes *a priori* knowledge of them possible, for we can understand what we put into them—we can discover the rules according to which we constitute them. In this way Kant justifies his realism with respect to the phenomenal world without any appeal to transcendence—indeed, in the face of its outright denial.

THE CATEGORIES

Kant's first change to the traditional Piatonistic framework is to substitute for the forms the categories, pure concepts of the understanding. These are innate ideas of the kind smiled upon by every concept rationalist. But there is no abstract realm of forms to which they must correspond. Their independence dissolves the epistemological difficulty arising for the aspect of the mind turned toward the forms in Platonic theories of mind.

All knowledge, Kant observes, involves concepts; all concepts, in turn, "rest on functions," "bringing various representations under one common representation" (A 68, B 93). The representations united in a concept may be sensible intuitions or other concepts. Kant here makes an important concession to empiricists such as Hume: the content of concepts traces ultimately to sensation. Kant makes much of this in the Transcendental Dialectic to refute the transcendence thesis. In deriving the categories, however, he focuses on the mediate character of concepts. Concepts of objects always relate to those objects indirectly:

> Since no representation, save when it is an intuition, is in immediate relation to an object, no concept is ever related to a concept immediately, but to some other representation of it, be that other

> representation an intuition, or itself a concept. Judgment is therefore the mediate knowledge of an object, that is, a representation of a representation of it.
>
> (A 68, B 93)

This has the consequence, critical to the Copernican revolution Kant means to effect, that both judgments and objects are products of synthesis.

Knowledge, Kant contends, always takes the form of judgments. (This is true at least for discursive knowledge, that is, knowing *that,* as opposed to knowing *how* or knowing *to*.) Judgments are combinations of concepts, which, in turn, are rules for synthesis, bringing together various sensations or concepts. Concepts relate to objects because they are such functions of synthesis. To discover the pure concepts of the understanding, therefore, we must find the functions of synthesis with *a priori* rather than empirical origins.

The content of judgments, we might say, always has an empirical source, for the content of the concepts that comprise them arises ultimately from sensation. A concept unites sensible intuitions or other concepts that themselves unite sensible intuitions or other concepts. The chain cannot proceed to infinity; at some point, it terminates in intuition. This may suggest that there are no pure concepts. But not all functions of synthesis operating in a judgment comprise part of its content. A judgment has both a content and a form. The content stems from experience, but the form does not. We can identify the pure concepts of the understanding, then, by examining the forms of judgment. Fortunately, there is already a science that abstracts from the content of judgments and examines only their forms—logic.[6]

Kant, using Aristotelian logic, derives the following table of judgments (A 70, B 95):

I	II	III	IV
Quantity	*Quality*	*Relation*	*Modality*
Universal	Affirmative	Categorical	Problematic
Particular	Negative	Hypothetical	Assertoric
Singular	Infinite	Disjunctive	Apodeictic

Every judgment, Kant contends, has a quantity, a quality, a relation, and a modality. In quantity, it is either universal ('every metal is a body,' for example), particular ('some metals are yellow'), or singular ('Socrates is a philosopher'). In quality, it is either affirmative ('Socrates is mortal'), negative ('Socrates is not mortal'), or infinite ('Socrates is immortal'). In relation, judgments may be categorical ('gold is a metal'), hypothetical ('if every metal is a body, gold is a body'), or disjunctive ('gold is a metal or a rare earth'). And, in modality, judgments are problematic ('gold may be a metal'), assertoric ('gold is a metal'), or apodeictic ('gold must be a metal'). The table of judgments thus gives what Kant takes to be an exhaustive account of the forms of judgment.

From the perspective of modern logic, the table seems incomplete. It does not include the quantity of 'most metals are heavy' or 'many metals oxidize'; it omits the modality of 'Socrates ought to avoid hemlock.' It has no place for judgments with complement clauses, such as 'Socrates knew that the hemlock would kill him,' and makes no provision for the abstraction relating 'kind' and 'kindness,' 'friend' and 'friendship.' It is silent about verb tense and aspect. (Kant considers time a form of sensibility, not of judgment, and so considers it beyond the province of logic.) It omits identity. Kant's table is not only incomplete from a modern point of view; it is redundant. Many entries can be derived from others with the help of forms recognized by contemporary logicians. There is no consensus on exactly what such a table would need to reflect all the forms of possible judgment. Kant is surely correct, however, that what we now call quantifiers, connectives, and modalities are required.

The functions of judgment are not themselves the pure concepts of the understanding, but they correspond to them one-to-one. Kant lists the pure concepts of the understanding in his table of categories (A 80, B 106):

I
Of quantity
Unity
Plurality
Totality

II
Of quality
Reality
Negation
Limitation

III
Of relation
Of inherence and subsistence
Of causality and dependence
Of community

IV
Of modality
Possibility–impossibility
Existence–nonexistence
Necessity–contingency

Some of these relate directly to a corresponding entry in the table of judgments—'Negative' and 'Negation,' for example, or 'Problematic' and 'Possibility—Impossibility.' Other connections—'Disjunctive' and 'Of community,' for instance—seem tenuous. How does Kant derive the table of categories? His detailed arguments are not terribly important, for, as we have seen, the entries on the table of judgments reflect an outdated logic. But it is important to understand what the categories are.

Roughly speaking, what the table of judgments is to judgments, the table of categories is to objects. Just as the table of judgments outlines the possible logical forms of judgment, so the table of categories outlines the possible logical forms of objects. This explains, for example, why, corresponding to the assertoric modality, we find 'Existence-nonexistence' rather than Truth-falsehood.' Synthesis of the manifold of intuition is essential to concepts. But synthesis alone does not suffice for knowledge. Knowledge of objects requires a unification of the pure synthesis of the sensible manifold. That is, the concept of an object is special: It is the concept of a unified thing. In different terminology, concepts of objects not only tell us when a certain predicable or general term applies, but also when it is being applied to one and the same thing.[7] The pure concepts of the understanding "apply *a priori* to objects of intuition in general" (A 79, B 105); they spell out the possible forms of such objects by indicating the possible kinds of unity.

Kant's key assumption in deriving the categories in this way is that "The same function which gives unity to the various representations *in a judgment* also gives unity to the mere synthesis of various representations *in an intuition*" (A 79, B 105). Each such unity is a pure concept of the understanding. Why are the unifying functions in judgments and objects the same? We have seen above that judgments and objects are both products of synthesis. Moreover, knowledge is always knowledge of objects through judgments. This suggests that judgments, at least of the sort appropriate to knowledge, are possible only by virtue of the unifying activity of the categories. Still, this does not suffice to establish the identity of function. It shows that the unifying activity in a judgment presupposes the unifying activity in an intuition, not that they have the same form.

Kant's argument turns on his notion of a concept. The unity of judgments and objects alike is a unity in a concept. This not only explains the link between the table of judgments and the table of categories; it also explains why the pure concepts of the understanding have *a priori* validity, avoiding the challenges of the skeptics.

> Concepts of objects in general thus underlie all empirical knowledge as its *a priori* conditions. The objective validity of the categories as *a priori* concepts rests, therefore, on the fact that, so far as the form of

> thought is concerned, through them alone does experience become possible. They relate of necessity and *a priori* to objects of experience, for the reason that only by means of them can any object whatsoever of experience be thought.
>
> (A 93, B 126)

To understand the role that concepts play in Kant's theory of mind, however, we must examine his account of the kinds of synthesis.

THE SUBJECTIVE DEDUCTION

Kant's argument for the first key to his solution to the problems arising from the Platonic framework—the pure concepts of the understanding—also defends and develops the second key, the Copernican revolution. The argument occupies the portion of the *Critique* he entitles "The transcendental deduction of the pure concepts of the understanding." There are, however, two very different versions of this argument in the first and second editions of the *Critique*. The first edition version presents a model of how the mind constructs objects from the data of sense, arguing that the pure concepts of the understanding are essential to the process. The second version presents no model, but analyzes the implications of the "I think." The general strategy, however, remains the same. The categories are "concepts of an object in general" (B 129); they are "*a priori* conditions of the possibility of experience" (A 94, B 126). We are able to experience objects, that is, only because we have the concept of an object. We do not derive this concept from experience, for we could not experience anything as an object without already having the general concept of an object.

The transcendental deduction of the first edition is notoriously difficult; Kant apparently pieced it together from four manuscripts composed at different times and reflecting four different stages of his thinking.[8] It moreover includes two arguments: an "objective" deduction seeking to establish "the objective validity of *a priori* concepts," and a "subjective" deduction investigating "the faculty of thought" (A x–xi).

The subjective deduction outlines a three-part model of mental activity—specifically, of the generation of a judgment of experience such as 'This is a triangle.' This model shows, in Kant's view, how judgments of experience require the categories. Kant defines a pure concept of the understanding as a concept without any empirical content, that is, as one that "universally and adequately expresses…a formal and objective condition of experience" (A 96). His strategy is to "prove that by their

means alone an object can be thought" (A 97). This, he says, "will justify their objective validity," for, if the categories are necessary conditions of experience, nothing could be an object of experience without complying with the categories.

Sensation, Kant holds, is a manifold. It bombards us with a plethora of possible sources of information. Out of this multiplicity we synthesize representations, concepts, and judgments. The first act of synthesis is that of apprehension in intuition. All sensations occur in time.[9] We bind the multiplicity sensation offers into unified items of sense. A sensation of a triangle, for example, may consist of various visual and tactile impressions received over a short interval of time. We experience it as a single sensation, usually without being aware of its complex nature. In short, we organize the data of sense into discrete sensations. This organization is the synthesis of apprehension in intuition.

The second act is the synthesis of reproduction in imagination. Kant argues that "experience as such necessarily presupposes the reproducibility of appearances" (A 101–2). His premises concern pure intuitions of space and time—drawing a line in thought, for example, or thinking of a number—which, he maintains, are possible *a priori*. Kant's theory of pure intuitions is controversial and somewhat obscure. But we can argue the point on other grounds. Sensations, considered individually, are not full-blown objects of experience. We can have many sensations of the same object. We might view a triangle, for example, from many different perspectives. To make any judgment about such an object of experience, we must relate sensations to each other, being capable of recognizing them as sensations of the same object. How we do this is of course an empirical question. But do it we must if we are ever to form concepts of objects of experience.

That brings us to the third act, the synthesis of recognition in a concept. Throughout this discussion, Kant seems to operate with two ideas of what concepts are. The awareness of the unity of various sensations, Kant says, is a concept—etymologically, a "thinking together." Having related sensations in the synthesis of reproduction in imagination, we form a concept through our consciousness of their unity as an object. But Kant also speaks of a concept as a rule: "a concept is always, as regards its form, something universal which serves as a rule" (A 106). Specifically, a concept is a rule for the synthesis of the manifold of intuition. These two notions of concepts are intimately connected:

> the unity which the object makes necessary can be nothing else than the formal unity of consciousness in the synthesis of the manifold of representations. It is only when we have thus produced synthetic unity in the manifold of intuition that we are in a position to say that

> we know the object. But this unity is impossible if the intuition cannot be generated in accordance with a rule by means of such a function of synthesis as makes the reproduction of the manifold *a priori* necessary, and renders possible a concept in which it is united. Thus we think of a triangle as an object, in that we are conscious of the combination of three straight lines according to a rule by which such an intuition can always be represented. This *unity of rule* determines all the manifold, and limits it to conditions which make unity of apperception possible.
>
> (A 105)

Essential to recognizing something as an object, then, is a consciousness of its unity. But this consciousness is possible only if the object is constructed according to a rule. We can recognize a collection of intuitions as constituting a single object only by having a rule for uniting them into that object. We take a triangle as a single object rather than three distinct line segments that happen to intersect because we have a rule for uniting those segments. Without such a rule, we would be left with a manifold. The two notions of concept are connected, then, in that we are aware of unity (concept in sense one) according to a rule (concept in sense two).

The rule-governed character of object construction brings with it a kind of necessity. To count as a triangle, for example, something must be a plane figure with three sides and three angles. So, it is a necessary truth that triangles have three sides and three angles. This, it might seem, is not the sort of necessity that interests Kant; 'triangles have three angles' is analytic. But when we ask what necessary truths stem, not from the rule for constructing triangles or any other kind of object, but from the rule-governed constructions of objects in general, we obtain a more interesting answer. All objects must be unified, for example; the concept of an object is the concept of a single thing.

Necessity, in turn, implies transcendental conclusions about our contributions to objects.

> All necessity, without exception, is grounded in a transcendental condition. There must, therefore, be a transcendental ground of the unity of consciousness in the synthesis of the manifold of all our intuitions, and consequently also of the concepts of objects in general, and so of all objects of experience, a ground without which it would be impossible to think any objects for our intuitions.
>
> (A 106)

Kant's argument begins with the premise that necessity is grounded in a transcendental condition. He does not argue for it because he takes it as

evident from Hume's writings. Necessary connections, Hume observes, cannot be found in experience. We are directly aware of a succession of things but not of the connections between items of the sequence. (In Frank O'Malley's words, "Life is just one damned thing after another.") Our concept of necessity, Hume concludes, must come from us, not from what we experience. So far, Kant agrees. But Hume goes on to attribute the source of our concept of necessity to the passionate side of our nature, to a feeling of expectation. Kant, in contrast, finds necessity's source in the unity of objects. We experience objects, not just a whirling mass of sensations. And, as we have seen, it is a necessary truth that all objects are unified. Kant concludes that there is a transcendental ground of that unity. The source of the unity of objects, moreover, is also the source of the concept of an object in general; it thus underlies our experience of any object.

The transcendental ground of the unity Kant terms *transcendental apperception*. When we reflect on the contents of our own consciousness, as Hume stresses, we are aware only of a succession of mental states; we do not confront a unified self. The contents of consciousness are always changing: "No fixed and abiding self can present itself in this flux of inner appearances" (A 107). Thus, we find no unity in what Kant calls empirical apperception or inner sense. But there must be a ground of unity in us. This brings us to Kant's key contention: The ground of the consciousness of unity is the unity of consciousness. The source of our consciousness of the unity of objects is the underlying unity of our consciousness itself. This unity of apperception is "the *a priori* ground of all concepts" (A 107), for all concepts unify the manifold of sensibility into objects. The most general concepts, relating to the form of an object in general, are the categories. The unity of apperception and with it the categories underlie the lawlike connections we find among objects of experience and the synthetic *a priori* knowledge we have of them.

The subjective deduction, then, means to spell out Kant's Copernican revolution in subjective detail. We can know certain truths about objects independently of experience, for we can uncover the pure concepts of the understanding relating to the form of an object in general. These concepts do not arise from experience; they underlie the possibility of experience. So, we can know *a priori* that any experience will conform to them. This establishes realism, the view that we can attain knowledge of objective reality, within the realm of objects of experience. It also establishes concept rationalism. Most importantly, it solves the traditional Platonic problem of the conformity of the world to our innate ideas without invoking God, *ex caelo* or *ex machina*.

THE OBJECTIVE DEDUCTION

Kant nevertheless views the subjective deduction as inessential to the success of the critical enterprise. He needs to establish the objective validity of the categories; he does not need to spell out the subjective details of the faculty of thought. Kant is trying to show that the categories underlie our judgments about objects. Judgments, however, are the products of the three-stage model of mental activity outlined in the subjective deduction, and the categories enter the model only in the third stage. The first two stages are thus inessential to the argument. The subjective deduction, moreover, treats the crucial third stage cursorily, leaving the role of the categories unclear. So, Kant begins another argument, the objective deduction, to treat only the relation between judgments and the categories. In the second edition, Kant omits the subjective deduction entirely and elaborates the objective deduction of the first edition.

Kant begins, not by considering the process of transforming the data of sense into judgments, but by reflecting on the form of sensibility itself. "We must begin with pure apperception," he says. "Intuitions are nothing to us, and do not in the least concern us if they cannot be taken up into consciousness" (A 116). That is, the model of mental activity presented in the subjective deduction presupposes, even at its earliest stage, the unity of consciousness. It relates the data of sense to a single consciousness or mind in which reside the faculties of sensibility, imagination, and understanding.

> For the manifold representations, which are given in an intuition, would not be one and all *my* representations, if they did not all belong to one self-consciousness. As *my* representations (even if I am not conscious of them as such) they must conform to the condition under which alone they *can* stand together in one universal self-consciousness, because otherwise they would not all without exception belong to me.
>
> (B 132–3)

The unity of consciousness thus underlies the possibility of sensation and thought. Kant obtains "the transcendental principle of the *unity* of all that is manifold in our representations, and consequently also in intuition" (A 116), which he terms "the highest principle in the whole sphere of human knowledge" (B 135). All representations are representations precisely because they can be represented in empirical consciousness. But an empirical consciousness requires a transcendental consciousness, for it is unified without containing its unity as an element. All representations therefore presuppose the transcendental unity of apperception.

To put Kant's argument differently: Empirical consciousness, as far as its contents are concerned, is a mixed bag. We cannot discover its unity from its contents. Nor can we determine that a given succession of mental states is unified into a single empirical consciousness by examining the contents of those states: "the combination *(conjunctio)* of a manifold in general can never come to us through the senses, and cannot, therefore, be already contained in the pure form of sensible intuition" (B 129). That a given representation is Jones's representation, therefore, we cannot analyze by appeal to monadic properties of that representation. We cannot analyze it by appeal to relations among representations. We must instead analyze it by appeal to a relation between the representation and something else. Whatever is responsible for the unity of consciousness is not to be found in empirical consciousness but in the relation between its contents and something else, outside and underlying empirical consciousness. That is the transcendental unity, "that which itself contains the ground of the unity of diverse concepts in judgment, and therefore of the possibility of the understanding, even as regards its logical employment" (B 131). At one point Kant even identifies the transcendental unity with the understanding (B 134 n.). The transcendental unity of apperception manifests itself in the 'I think' that we can append to all our judgments and representations:

> It must be possible for the 'I think' to accompany all my representations; for otherwise something would be represented in me which could not be thought at all, and that is equivalent to saying that the representation would be impossible, or at least would be nothing to me.
>
> (B 132)

This argument for the transcendental unity of consciousness allows Kant to speak of a transcendental *principle:* "a principle of the synthetic unity of the manifold in all possible intuition" (A 117). The principle of the unity of consciousness itself is analytic, roughly of the form 'I am I' (B 135). But the transcendental principle Kant obtains from it is nonetheless synthetic. We have seen that a sensation is part of Jones's empirical consciousness if and only if it stands in the appropriate relation to Jones's transcendental unity of apperception. This, Kant insists, is a necessary truth about our kind of consciousness, one which permits *a priori* knowledge of the unity of consciousness without manifesting that unity explicitly in its contents. It follows that Jones can receive a sensation only if it stands in relation to Jones's transcendental unity. We can know *a priori,* then, that any sensation must relate to the transcendental unity: "all the manifold of intuition should be subject to conditions of the

original synthetic unity of apperception" (B 136). This proposition, furthermore, is synthetic. We derive it, not by analyzing the concept of sensation or even the concept of the transcendental unity, but by connecting the two by way of the transcendental argument just reviewed. As we might expect concerning the argument for any synthetic truth, it rests on experience. But it permits *a priori* knowledge, knowledge that can be derived independently of experience and that holds necessarily, because it concerns the form of any possible experience.

Kant is driving toward the conclusion that "appearances have *a necessary relation to the understanding*" (A 119). Appearances, he says, are "data for a possible experience"; they therefore have to relate to the understanding. The transcendental unity of apperception is responsible for what Kant calls the *affinity* of our representation—that is, their being *our* representations, their constituting a single empirical consciousness—and also the rule-governed character of the synthesis of the manifold of intuition. If that synthesis were not rule-governed, the combination of the data of sense would not yield knowledge but random and "accidental collocations" (A 121) such as the products of imagination in the usual sense. We may freely combine concepts, to form the notion of a three-headed dragon or a golden mountain, but we gain no knowledge of what is actual from exercising that freedom. We attain knowledge of objects because the construction of objects actually presented in experience is rule-governed.

Sensibility presents us with the data of experience, giving it the form of space and time; the understanding formulates judgments. The rule-governed synthesis linking the two is a product of the imagination and is unified by pure apperception. Our perception of a triangle, for example, is rule-governed; we cannot connect any sensations we like, label them a triangle, and obtain knowledge. The rule, in this case, is quite specific about geometrical form. Underlying such specific rules, Kant points out, is a general set of rules for generating concepts of objects. We can call something a triangle only if it has three sides and three angles. More broadly, we can call something an object only if it meets certain conditions, that is, satisfies certain rules. Those rules are specified by the categories. Kant therefore characterizes the understanding as the faculty of rules.

The objective deduction, Kant maintains, shows that we can know objects because we construct them: "Thus the order and regularity in the appearances, which we entitle *nature,* we ourselves introduce. We could never find them in appearances, had not we ourselves, or the nature of our mind, originally set them there" (A 125). The understanding, consequently, is nothing less than "the lawgiver of nature" (A 126). This follows from Kant's argument, for it has shown that the transcendental

unity is "an objective condition of all knowledge. It is not merely a condition that I myself require in knowing an object, but is a condition under which every intuition must stand in order *to become an object for me*" (B 138).

THE DIALECTIC

The Transcendental Analytic and related portions of the *Critique* attempt to justify Kant's rationalism. The Transcendental Dialectic, which comprises most of the second half of the book, tries to justify Kant's thesis of immanence. As Kant puts it, the topic of the Dialectic is illusion. Certainly, he means to show that the hope of extending knowledge beyond the realm of sense experience is illusory. But he uses the term 'illusion' in a more specific sense: "an *illusion* may be said to consist in treating the *subjective* condition of thinking as being knowledge of the *object*" (A 396; see A 297, B 353–4). The key to the Analytic is the Copernican revolution, the idea that the faculty of thinking constitutes objects. This should not tempt us to conclude, however, that subjectivity and objectivity—thinking and knowing—match effortlessly. Clearly we may think of things that are not objectively real through imagination. We may also make mistakes. Most seriously, our thinking extends easily beyond the realm of sense experience. We may engage in metaphysical contemplation, arguing about the freedom of the will, the existence of God, and the mortality or immortality of the soul. But Kant denies that we can attain any real knowledge of these matters.

Kant differentiates thinking and knowing, subjectivity and objectivity, by distinguishing the transcendental unity of apperception from the subjective unity of consciousness. To understand the distinction, we must return to the argument of the Transcendental Deduction, which uses the subjective unity to argue for the transcendental unity. The subjective unity of consciousness is a determination of inner sense. The manifold of intuition is given to us in experience, and our experience constitutes a single experience; this is the subjective unity. The manifold of intuition is united in the concept of an object through the transcendental unity. The subjective unity of consciousness is a condition of all thinking; the transcendental unity is a condition of all knowing.

This distinction is extremely important for Kant; transcendent metaphysics results from its confusion. We may think whatever we like in imagination. We may connect concepts and intuitions freely without concern for their presence in experience. The transcendental unity, however, directs our thought toward an object and toward reality. We can know a synthetic judgment only by some connection with experience. This

is why we cannot have knowledge that transcends experience: "The *possibility of experience* is, then, what gives objective reality to all our *a priori* modes of knowledge" (A 156, B 195). Indeed, it explains Kant's first example of a synthetic *a priori* principle: "every object stands under the necessary conditions of synthetic unity of the manifold of intuition in a possible experience" (A 158, B 197).

Kant's distinction between the transcendental and subjective unities has two important consequences. First, a rational psychology—a discipline taking the 'I think' as its sole text (A 343, B 401) and amounting to a theory of the soul—is impossible. One might suppose, given the account of the transcendental unity, that the "I," or, to use Kant's term, the soul, is a simple, unified substance, and that we can discover this *a priori*. This, however, is a confusion. One can argue that the representation of the "I" is a representation of a substance, of something simple and unified. But to deduce that the "I" *is* a substance, simple and unified, is to commit a fallacy.[10] In fact, it is to invite the skeptic's objections all over again. Nothing here guarantees the veridicality of our representations. From the perspective of transcendental (rather than rational, that is, rationalist and transcendent) psychology, the "I" is "completely empty": "it is a bare consciousness which accompanies all concepts. Through this I or he or it (the thing) which thinks, nothing further is represented than a transcendental subject of the thoughts=X" (A 346, B 404).

As with the self, so with things-in-themselves. The second consequence of Kant's distinction is thus that knowledge of things-in-them-selves is impossible; knowledge is limited to the sphere of experience. The limits of knowledge become clear in thinking about the role of the categories. The pure concepts of the understanding are conditions of the possibility of experience. They have *a priori* validity, against the claims of the skeptic, because "all empirical knowledge of objects would necessarily conform to such concepts, because only as thus presupposing them is anything possible as an *object of experience*" (A 93, B 126). Objects of experience must conform to the categories. Objects beyond the realm of experience, however, face no such constraint. In fact, we have no reason to believe that the categories apply to them at all. The categories conform to objects of possible experience because we synthesize those objects from the data of sensibility. What lies beyond sensibility lies beyond the categories, for we have no reason to believe that it results from such a process of synthesis.

This means that transcendent metaphysics is impossible. Metaphysical knowledge, to be interesting, must be knowledge of the world; it cannot be merely verbal. So, it must consist of synthetic propositions. Moreover, it cannot rely on experience; to be necessary and nonempirical, it must be *a priori*. Kant, as a rationalist, is committed to the possibility of synthetic *a*

priori knowledge. But such knowledge is possible only transcendentally, that is, through the contemplation of what makes experience possible. We secure the possibility of synthetic *a priori* knowledge by arguing for the categories. They apply, however, only to objects of possible experience. Kant derives rationalism, therefore, only by undercutting transcendence.

> No other objects, besides those of the senses, can, as a matter of fact, be given to us, and nowhere save in the context of a possible experience; and consequently nothing is an object *for us,* unless it presupposes the sum of all empirical reality as the condition of its possibility.
>
> (A 582, B 610)

We can witness Kant's application of his principle of immanence in his refutation of the cosmological argument for the existence of God. That argument appears in Aquinas, for example, as follows:

> In the observable world causes are to be found ordered in series; we never observe, or even could observe, something causing itself, for this would mean that it preceded itself, and this is impossible. Such a series of causes, however, must stop somewhere. For in all series of causes, an earlier member causes an intermediate, and the intermediate a last (whether the intermediate be one or many). If you eliminate a cause, you also eliminate its effects. Therefore, there can be neither a last nor an intermediate cause unless there is a first. But if the series of causes goes on to infinity, and there is no first cause, there would be neither intermediate causes nor a final effect, which is patently false. It is therefore necessary to posit a first cause, which all call "God."[11]

Kant's transcendental critique of this argument alleges "a whole nest of dialectical assumptions," of which he points out several: (a) The argument assumes that each event in the observable world has a cause. Kant agrees; he regards it as a synthetic *a priori* truth. But, as such, "This principle is applicable only in the sensible world; outside that world it has no meaning whatsoever" (A 609, B 637). (b) Why can't a series of causes go on to infinity? Kant finds nothing to justify this assumption even in the sensible world, (c) Is it true that, if you eliminate a cause, you eliminate its effects? Even if this holds in experience, we have no justification for extending it beyond experience, (d) Finally, why should we identify the first cause as God? Philosophers have understood God as the perfect being, "that, the greater than which cannot be conceived," the being more real than any other, and the necessarily existent being. To conclude that the first cause is

God, we must show at least that the first cause is perfect and necessary. Nothing in the proof accomplishes this. Consequently, Kant maintains that "the so-called cosmological proof really owes any cogency which it may have to the ontological proof from mere concepts" (A 607, B 635), for it assumes that perfection, necessity, and being the first cause all hold of the same thing.

The ontological proof appears in Anselm in the following form:

> Certainly, this being exists so truly that one cannot even think that it does not exist. For whatever must be thought to exist is greater than whatever can be thought not to exist. Hence, if that greatest conceivable being can be thought not to exist, then it is not the greatest conceivable being, which is absurd. Therefore, something so great that a greater cannot be conceived exists so truly that it cannot even be thought not to exist.[12]

The argument means to show that perfection entails necessity. That God is perfect Anselm takes as an analytic truth, as following from a definition of 'God.' He concludes that God exists necessarily.

Kant's assault on this argument is more complicated than his attack on the cosmological proof, but also more illuminating. This proof is a paradigm example of illusion, the mistaking of the subjective for the objective. It tries to establish the necessary existence of God from the mere concept of God. Kant is willing to grant that the argument shows that the concept of God, so defined, includes the concept of existence. But he denies that this implies anything at all about the existence of God in reality.

The key to Kant's attack on the ontological argument is his contention that 'being' is not a real predicate. Kant defines a determining predicate as "a predicate which is added to the concept of the subject and enlarges it" (A 598, B 626). It follows that a judgment with a determining predicate must be synthetic, for the predicate must enlarge the subject; it cannot already be contained in it. "'Being'," Kant insists, "is obviously not a real predicate; that is, it is not a concept of something which could be added to the concept of a thing" (A 598, B 626). A real predicate is capable of serving as a determining predicate. 'Being,' evidently, is not.

We might be tempted to conclude that existential judgments such as 'God is' or 'God exists' are analytic, for 'being' cannot serve as a determining predicate. But Kant clearly maintains that all existential judgments are synthetic. He argues specifically that 'God exists' is not analytic, and concludes, "as every reasonable person must, that all existential propositions are synthetic" (A 598, B 626). It follows that

'being' cannot be contained in the concept of a thing. But how can existential judgments be synthetic if they lack determining predicates?[13]

A synthetic judgment is not merely verbal; its predicate, according to Kant, must add something not already included in its subject. 'Being,' then, must add something to every subject concept. Yet it is not determining; it does not add to and enlarge the subject concept. 'Being' adds something that does not enlarge the concept of the subject.

To understand how this is possible, we must return to Kant's theory of concepts. Concepts are functions of synthesis that organize and unify the material of sense. They mold the data of sense into perceptions of objects (A 68, B 93, B 95). Consequently, their content relates essentially to the manifold of sense. In language and in thought, we can manipulate items however we like. Only through links to intuition, actual or possible, can we move from thinking to knowledge, activating the transcendental unity and giving our thoughts objective validity. (See A 155, B 194–5, B 146, B 165–6.) In short, concepts have content by virtue of the patterns of possible intuitions falling under them. This entails that 'being' is not a real predicate, for it lacks this sort of content. It cannot enlarge a subject concept; any intuition falling under the concept of a dollar falls under the concept of an existing dollar, and vice versa (A 599–600, B 627–8). It follows, moreover, that existential judgments are synthetic, for existence cannot be part of the content of a subject concept (A 225, B 272).

If 'being' lacks content definable in terms of the manifold of sense, what does it contribute to a judgment? Existential judgments do not enlarge or alter a rule for the synthesis of the manifold of intuition, but express the relation of the rule to the understanding. For Kant, then, 'being' is relational. The same holds of possibility and necessity, which share the fourth, "Modality" portion of the table of categories.[14] Kant maintains that the modality of a judgment adds nothing to the judgment's content. Instead, it determines the judgment's relation to the understanding: "The principles of modality thus predicate of a concept nothing but the action of the faculty of knowledge through which it is generated" (A 234, B 286–7). Existence and the other modalities contribute "a relation to my understanding" (A 231, B 284), determining "only how the object, together with all its determinations, is related to understanding and its empirical employment, to empirical judgment, and to reason in its application to experience" (A 219, B 266).

Kant compares the 'being' at stake in existential judgments to the 'being' of the copula (A 74, B 100; A 598–9, B 626–7). Both "distinguish the objective unity of given representations from the subjective" (B 141–2). Only by relating the terms of a judgment to the transcendental unity of apperception

> does there arise from this relation a *judgment,* that is, a relation which is objectively valid, and so can be adequately distinguished from a relation of the same representations that would have only subjective validity—as when they are connected according to the laws of association.
>
> (B 142)

'Being' in both roles distinguishes the subjective from the objective.

This is why the ontological proof is Kant's paradigm case of dialectical illusion. The advocate of the proof mistakes the subjective for the objective, failing to recognize that God's existence or necessity cannot be established analytically, from the definition of 'God' alone. In saying that something exists, we assert a relation to the understanding; we assert that we may experience the object, or stand in relation to it by way of empirical laws (A 219, B 266–7; A. 234 n., B 287 n.; A 616, B 644). And this cannot be derived from concepts alone. It follows that nothing exists with analytic or logical necessity:

> If I take the concept of anything, no matter what, I find the existence of this thing can never be represented by me as absolutely necessary, and that, whatever it may be that exists, nothing prevents me from thinking its nonexistence.
>
> (A 615, B 643)

We can now see how Kant can practice the transcendental method while rejecting transcendent metaphysics. The latter confuses the subjective and the objective, failing to recognize that concepts have content only in relation to experience. The transcendental method, however, focuses directly on the relation to the understanding at stake in questions of modality. Kant deduces the categories by reflecting on the sort of relation that must hold if experience of objects is to be possible.

HUMANISM

Kant carefully distinguishes his view from the idealism of Berkeley, which assails the notion of a reality beyond the realm of ideas. Kant's solution to Platonism's problems relies on distinguishing phenomena from noumena. Kant thus insists on the need to recognize nonmental objects, things-in-themselves, of which our appearances are appearances.

Kant nevertheless realizes that his theory is a form of idealism—transcendental idealism, he calls it—for truth, objectivity, and existence,

within the theory, become fundamentally epistemic notions. The same holds of all the modalities—possibility, truth or existence, and necessity — for all have the same function of relating a judgment to the understanding. Metaphysics is inseparable from epistemology; the root notions of metaphysics are all, in the end, epistemological notions.

Kant's epistemic conception of modality underlies his identification of *a priori* and necessary judgments. Saul Kripke has attacked this identification, pointing out that *a prioricity* is a matter of epistemology—can something be known independently of experience?—while necessity is a matter of metaphysics. Kripke has alleged, against Kant, that there can be contingent *a priori* and necessary *a posteriori* truths.[15] This seems plausible on the metaphysical view of necessity that Leibniz and Kripke share, namely, that necessity is truth in all possible worlds. But Kant rejects that view. A judgment is *a priori* if it can be known independently of all experience; if, that is, it holds no matter what experience might yield, or, to put it differently, if it holds no matter what the world *looks* like. A judgment is necessary, on the Leibniz-Kripke view, if it holds no matter what the world *is* like. Kant does not confuse these notions; he rejects the latter precisely because it is metaphysical in a transcendent sense. The truth of skepticism is that we cannot know what the world is like. The only notion of modality we can use is epistemic, in which we consider possible experiences rather than possible worlds. On this conception, of course, the *a priori* and the necessary are not only equivalent, but obviously so.

Moreover, it becomes possible to attain knowledge of necessary truths about objects of experience. Reason gets itself into trouble when it tries to leave the realm of possible experience. Kant is able to defend our knowledge of necessary truths against skeptics such as Hume because, for him, the *a priori* and necessary extend to the immanent sphere only, not to the transcendent. They are limited to the realm of possible experience. If *a priori* judgments were necessary in a strong metaphysical sense, then Kant's immanence thesis would be hard to understand.

The epistemic character of the basic notions of metaphysics—when these notions and, correspondingly, metaphysics are properly construed—is the central consequence of Kant's Copernican revolution. It would become fundamental to virtually all nineteenth-century approaches to philosophy. Skepticism, perhaps the chief philosophical puzzle since Descartes, would give way to puzzles arising from Kant's uniquely humanistic idealism. For Kant, as for the ancient Sophist Protagoras, man is the measure of all things. Kant, of course, takes the definite article here seriously. There is one and only one measure: the categories underlie all possible experience. Not everyone would agree. The nature and especially the uniqueness of the measure would define the chief battleground for philosophers during the next two centuries.

NOTES

4 The analysis is Vaihinger's. See ibid., p. 50; Kemp Smith, op. cit., pp. 13–14.

5 Descartes, *Meditations,* III.

6 Kant often speaks of the content and form of judgments in just this way. Introducing the table of judgments, he writes, "If we abstract from all content of a judgment, and consider only the mere form of understanding," we derive the table (A 70, B 95). At other times, however, he treats the form and content very differently. Modality, for example, differs from the other aspects of judgment in the table in that "it contributes nothing to the content of a judgment (for, besides quantity, quality, and relation, there is nothing that constitutes the content of a judgment)" (A 74, B 100). These are plainly inconsistent. In the former passage, Kant speaks of empirical content or, more precisely, the content of the impure concepts in a judgment; in the latter, he speaks of logical content. It is tempting to identify the form of a judgment with its logical content, but Kant's theory of the modalities makes that impossible. See my "Kant on Existence and Modality," *Archiv für Geschichte der Philosophie,* 64, 3 (1982): 289–300.

7 That is, concepts of objects are rules of individuation as well as application. For a sophisticated modern treatment of this distinction, see A.Gupta, *The Logic of Common Nouns* (New Haven: Yale University Press, 1984).

8 See H.Vaihinger, "Die transcendentale Deduktion der Kategorien," *Gedenkschrift für Rudolf Haym* (1902); Kemp Smith, op. cit., pp. 202ff.

9 Kant's theory of time occupies part of the Transcendental Aesthetic. In brief, time is the form of inner sense, the progression of sensations, thoughts, and, in general, representations that constitutes empirical consciousness. Space and time, Kant argues, are *a priori* forms of intuition, for they are necessary conditions of sensation. We cannot sense anything without sensing it in space and time, that is, as spatially and temporally located. Time is moreover the form of inner sense because we cannot think anything without thinking it in time, that is, without our thought being part of a temporal sequence.

CHAPTER 3
Kant's moral and political philosophy

Don Becker

Practical philosophy, for Kant, is concerned with how one ought to act. His first important work in practical philosophy, *Foundations of the Metaphysics of Morals,* provides Kant's argument for the fundamental principle of how one ought to act, called the "categorical imperative," which basically requires one to act only according to principles that are themselves fit to be universal law. In Part I of this chapter we will focus on Kant's argument for the categorical imperative, and see how it functions as the fundamental principle of his moral philosophy. In Part II we will look at Kant's political philosophy, seeing both that it is grounded in this fundamental principle of how one ought to act, and that it gains support from other aspects of Kant's philosophical thinking.

PART I: KANT'S MORAL PHILOSOPHY

Inasmuch as Kant thinks that the fundamental principle of how one ought to act must be capable of grounding a definitive answer in all circumstances, he recognizes that no empirical study, which is dependent on the contingent nature of the world as we experience it, can provide the sort of principle that he seeks. Instead, Kant will proceed with an *a priori* study of how one ought to act, which, insofar as it is independent of the contingent nature of the world as we experience it, can provide a definitive principle. Two forms of *a priori* study that Kant employs are the analysis of concepts and

transcendental arguments. According to the former, insofar as some concept applies, whatever is entailed in that concept is true. According to the latter, insofar as some concept applies, whatever is a necessary condition of its application is true. Thus, Kant begins with the two concepts that are fundamental to his intended study, "morality" and "rational being," and determines that they reveal the truth of the categorical imperative. (Although the concept "rational being" is really the fundamental concept employed by Kant, the concept "morality," which he could have derived from the concept "rational being," plays a central role in his presentation.) Kant's presentation includes two basic steps. First, he asks what is meant by the concept "morality," and argues that it entails rational beings acting in accord with the categorical imperative. This, however, only answers the question of what morality is on the assumption that morality exists. Kant then considers the concept "rational being," and argues that a necessary condition of a being thinking that this concept applies to itself is that it think of itself as free. Furthermore, since Kant equates freedom in this sense (i.e. "positive freedom") with what he calls autonomy, and autonomy with subjection to the categorical imperative, it follows that beings who think of themselves as rational must consider themselves to be subject to the categorical imperative that he has described.[1]

"Morality" and "rational beings"

Kant engages in the *a priori* study of ethics, or metaphysics of morals, because this is the only way to gain definitive knowledge of how one ought to act. He proceeds by first considering what is meant by "morality," and determining that it means neither more nor less than acting according to the categorical imperative (*FMM,* 58).[2] Although more must be said before it is possible to explain the categorical imperative fully, and the exact nature of the moral principle that it designates, nevertheless, if one merely considers the two words that make up the term, an important aspect of its nature is revealed. "Categorical" means absolute, without qualification or exception, and "imperative" refers to a type of command. Thus, a categorical imperative is an absolute command.

According to Kant, "Everyone must admit that a law, if it is to hold morally (i.e. as a ground of obligation), must imply absolute necessity" (*FMM,* 5). Thus, Kant treats it as obvious to everyone that morality ultimately entails an absolute command or categorical imperative. Furthermore, since nothing absolute can be derived from something contingent, he argues that the only way to determine the exact nature of this absolute command is to engage in the *a priori* study of practical reason (i.e. reason related to acting):

> unless we wish to deny all truth to the concept of morality and renounce its application to any possible object, we cannot refuse to admit that the law is of such broad significance that it holds not merely for men but for all rational beings as such; we must grant that it must be valid with absolute necessity and not merely under contingent conditions and with exceptions. For with what right could we bring into unlimited respect something that might be valid only under contingent human conditions? And how could laws of the determination of our will be held to be laws of the determination of the will of any rational being whatever and of ourselves in so far as we are rational beings, if they were merely empirical and did not have their origin completely *a priori* in pure, but practical reason?
>
> (*FMM,* 24)

Kant holds that morality entails absolute laws; that, insofar as they are absolute, these laws must hold not only for human beings but for all similar, i.e. rational, beings; and that to have such general applicability these laws cannot be learned through experience or any empirical study, but must be derived through a purely *a priori* study.

Kant thinks that people, insofar as they are rational, are subject to an absolute moral law. Kant thinks that the fact that rational beings are subject to an absolute moral law is what fundamentally distinguishes them from all of the other material things in the world, which he recognizes to be subject to the laws of nature. Thus, Kant distinguishes physics, which is concerned with those objects that are subject to the "laws of nature," from ethics, which is concerned with those objects that are subject to the "laws of freedom" (*FMM,* 3). As will become clear, these laws of freedom constitute the absolute moral law.

This distinction between physics and ethics can be somewhat confusing; after all, isn't everything subject to the laws of nature? Maybe not. Think for a moment of a world in which *everything* were subject to the laws of nature. This would be a world of strict causal determinism; everything that happened would have followed inexorably from what preceded it. Among other things, all human behavior would be completely determined by these laws. But if all human behavior is causally determined according to laws of nature, then in what sense could people be considered morally responsible for their acts? Thus, if the concept "morality" is to make sense, then it must be possible to think of people not only as common physical entities subject to the laws of nature, but also, in another sense, as rational beings, subject to the laws of freedom (see *FMM,* 68–73).

Kant thinks of people in just this dual way, as sensible or physical beings, causally determined according to the laws of nature, and as intelligible or purely rational beings, independent of causal determinism and capable of

acting in accord with the laws of freedom. Accordingly, Kant suggests that the human will is subjected to two influences (see e.g. *FMM,* 16, 42). As sensible or physical beings, human beings have desires that arise from their physical nature and corresponding physical needs, which Kant broadly characterizes as the desire to be happy. This universal desire, as well as other indiosyncratic particular desires, is the source of inclinations, which exert a potentially controlling influence on the will. However, insofar as human beings are intelligible or purely rational beings, they recognize the laws of freedom, resist the force of inclination, and determine their will for themselves, independently of external influences and inclinations. Furthermore, and recognition of this is crucial for a correct understanding of Kant's moral philosophy, Kant thinks that *all* rational beings, insofar as they determine their will for themselves independently of their inclinations, will recognize the very same principle, the categorical imperative, as expressing the law of freedom in accord with which they ought to act (*FMM,* 71).

Thus far we have seen that the concept of "morality" entails the notion of an absolute law or "categorical imperative," and that it can only apply to (rational) beings who can resist their inclinations and choose to follow such a law of freedom. Let us now look more closely at exactly what Kant means by a "categorical imperative."

Kant's concept of a categorical imperative

Imagine that the human will were influenced only by pure reason. Whatever pure reason recognized as right would necessarily be willed, and whoever was possessed of pure reason would never do wrong. But Kant has said that the human will is influenced by both reason and inclination. Therefore, human beings don't necessarily will (and consequently act) as pure reason reveals is right, because they can be led astray by their inclinations. Thus, if a human will is to be determined in accordance with the objective moral law, it must be constrained. Kant calls the formula that expresses the command that constrains this will an imperative. Kant holds that there are two types of imperatives:

> All imperatives command either *hypothetically* or *categorically.* The former present the practical necessity of a possible action as a means to achieving something else which one desires (or which one may possibly desire). The categorical imperative would be one which presented an action as of itself objectively necessarily, without regard to any other end.
>
> (*FMM,* 30)

Two points that are rather important to Kant are expressed in this passage.

First, Kant reveals the basic difference between hypothetical and categorical imperatives. All imperatives determine the will to some good, but hypothetical imperatives say only that some action is good given that one has a particular purpose. Hypothetical imperatives reveal the means to given ends. Since these ends are contingent, however, as are all the ends that one commonly imagines (including the desire for happiness) inasmuch as there is no necessity for human beings to be so constituted that they have any of the particular desires that they experience, these ends cannot give rise to a categorical imperative. A categorical imperative, as Kant says, cannot depend on any contingent end, but "would be one which presented an action as of itself objectively necessary."

Second, by saying of a categorical imperative that it "*would* be one…,' Kant is making it clear that there may be no categorical imperative. Kant is only talking about what a categorical imperative *would* be like if one existed. This is very important, and is consistent with a point made earlier. Human beings can only be subject to a moral law if they are capable of resisting the influences of their inclinations, and determining their wills through reason in accord with a principle or law that is known *a priori*. There can be no moral responsibility for beings whose actions are all causally determined. Thus, before Kant can actually assert that there is a categorical imperative, he must first show that human beings have reason to believe themselves capable of determining their wills through reason. Nevertheless, Kant's argumentative strategy is to hold off on the question of whether human beings are actually subject to the categorical imperative, and to first pursue the question of what a categorical imperative would be, assuming that one exists.

The first formulation of the categorical imperative

Kant argues that there can be only one categorical imperative, and that, from the very idea of *a* categorical imperative, one can deduce a formula of *the* categorical imperative. Kant's argument can be expressed as follows (see *FMM,* 37–8). A categorical imperative is an absolute law. Although it is obvious that a categorical imperative entails an absolute law, it is not at all clear what this law will command. Imagine any possible content of this law, say, to maximize human happiness. Insofar as what constitutes human happiness is contingent (human beings could be constituted differently), all that one can construct is a hypothetical imperative directed

to a particular contingent end. Thus, a categorical imperative cannot be directed to any particular contingent end.

But if the imperative cannot be directed toward any particular contingent ends, then what is left? Although later a formulation of the categorical imperative that is based on an end that is not contingent will be considered, for now it seems that the imperative can require nothing more than conformity to absolute law. But since there is nothing in particular to which this absolute law can be directed, it can command only that one act in a way that is at least consistent with the possibility of absolute law. Kant expresses this categorical imperative as follows: "Act only according to that maxim by which you can at the same time will that it should become a universal law" (*FMM,* 38). This imperative does not rely on any specific content, but states the formal requirement that one always act in a way that one could will to be required to act by an absolute law.

The application of the categorical imperative and the distinction between perfect and imperfect duties

What does it mean to act only according to that maxim by which you can at the same time will that it should become a universal law? First, what is a maxim? A maxim is a general principle according to which an individual acts. Thus, one might hold the maxim "I will watch television when bored," or "I will steal things when I desire more goods." Kant is saying that it is morally permissible to act according to one's maxim only if it is possible at the same time to will that it should become a universal law.

One of the most famous examples that Kant uses to help make his point clear is that of the maxim to make a false promise to honor one's debt when seeking a loan that one does not intend to pay back (see e.g. *FMM,* 18–19, 39). Can one hold this maxim and, at the same time, will that it should be a universal law? Well, imagine that there were a universal law to make false promises. In such circumstances, inasmuch as no one could be trusted, the institution of promising itself could not exist. Now, since it is logically impossible for one at the same time to will both to make a false promise and that the institution of promising not exist, it is immoral to act on the maxim to make a false promise when desirous of another's money. Thus, the categorical imperative, as well as stating a restriction on permissible behavior, also provides a test of whether the restriction applies. If one cannot conceive of acting on the maxim while, at the same time, the maxim holds as a universal law, as is the case in the example

of the false promise, then the maxim fails the test and may not be acted upon.

Immediately after introducing the categorical imperative, Kant provides four examples of its application, which are designed to represent a common division of duties into four basic categories. Kant provides examples of perfect duties and imperfect duties both to oneself and to others, which can be classified as shown below.

	Duty to oneself	*Duty to others*
Perfect duty	Do not commit suicide	Do not falsely promise
Imperfect duty	Develop talents	Be beneficent

While the distinction between duties to oneself and duties to others requires no explanation, this is not the case with the distinction between perfect and imperfect duties. Kant was not the first to distinguish between perfect and imperfect duties, but his distinction does not correspond exactly with that of his predecessors (*FMM,* 38 n.). As Kant employs the concepts, perfect duties are those with which one's every action must conform. Thus, in all but one special case (i.e. the duty to join the state), perfect duties actually entail prohibitions against actions that should never be performed under any circumstances, e.g. stealing and murder. Imperfect duties, for Kant, entail principles that one must adopt, but that one need not (and, in fact, cannot) act upon in every instance. One would not think of another as moral who did not hold, and in some appropriate circumstances act upon, the principle "Be beneficent." However, it is also clear that it is not possible for one's every act to be the fulfillment of an imperfect duty. For one thing, one's every act cannot be, say, beneficent, since one also must tend to one's own physical needs. Even more obviously, one's every act cannot be one of beneficence, and also one of developing talents, and also one that furthers every other imperfect duty. Thus, Kant distinguishes between those duties with which one's every act must accord, and those duties that require one to adopt a principle, but leave one leeway in deciding when to act upon it.

With this distinction between perfect and imperfect duties in mind, it is important to look back to the categorical imperative, and to the test of the permissibility of actions. There are two ways that a maxim can fail the test of the categorical imperative. There are maxims for which it is logically impossible, and thus inconceivable, for one to will the maxim and its universalization at the same time, as in the false promise example discussed above, and there are maxims for which there is merely a contradiction in the will of an individual who wills both the maxim and its universalization at the same time, as in the example discussed below. Kant

recognizes that there is an exact correspondence both between the duties generated by maxims failing the test of the categorical imperative in the former manner and perfect duties, and between the duties generated by maxims failing the test of the categorical imperative in the latter manner and imperfect duties (*FMM,* 40–1).[3] Both Kant's test of duties entailed in the categorical imperative and his reformulation of the distinction between perfect and imperfect duties gain support from this correspondence.

Having already seen in the example of a false promise how perfect duties are related to maxims for which it is inconceivable to will both the maxim and its universalization at the same time, let us turn to an example of an imperfect duty. Consider the maxim "I will not develop my talents when I seem to be doing fine without bothering." There is no logical contradiction that results from holding this maxim and, at the same time, willing that it should become a universal law. After all, one can very well imagine a rather easy life on a tropical island where one need do nothing more than pick fruit when hungry. Thus, adopting this maxim does not violate a perfect duty.

Remember, however, that the categorical imperative says to "act only according to that maxim by which you can at the same time will that it should become a universal law." While the test of perfect duties focuses on whether one *can* will that the maxim should become a universal law, thereby focusing on the logical possibility of holding the maxim and its universalization at the same time, the test of imperfect duties focuses on the question of whether one can *will* that the maxim should become a universal law. It may be logically possible to live a human life without developing one's talents, and yet it may be impossible, without contradiction, to *will* to live such a life. Although Kant's treatment of the examples of imperfect duties is very unclear, I think that one can make the best sense of his discussion if one reads him as saying that the human will is essentially unlimited in that it can hold anything imaginable as its object, and that a contradiction therefore results if one wills to place a limitation on one's own will. Thus, it is not logically impossible for people to will not to develop their talents (it doesn't violate a perfect duty) but it entails a contradiction in their will, since, on the one hand, their wills are essentially unlimited, but, on the other hand, willing the nondevelopment of one's talents yields a limitation on what one can effectively will. According to this analysis, it follows that there is an imperfect duty to develop one's talents.

The second formulation of the categorical imperative

Although Kant thinks that there is only one categorical imperative, he thinks that it can be formulated in more than one way. Of course, any

other formulation of the categorical imperative, if it is to be a formulation of the *same* imperative, must require and prohibit exactly the same actions as the first formulation. Although Kant maintains that the first formulation discussed above is the most fundamental and precise, he develops alternative formulations of the categorical imperative because they make the demands of morality more intuitively plausible (*FMM,* 53).

The derivation of the first formulation of the categorical imperative can be thought of as based on a consideration of the necessary form of a categorical imperative. The idea is that the imperative must express an absolute law, but, since the law cannot command any contingent particular and still be absolute, all that can be commanded is that any particular maxim to be acted upon must be of such a *form* that it could be universal law. The second formulation of the categorical imperative, in contrast, focuses on the proper *content* of one's maxims (*FMM,* 48, 53). Kant bases the second formulation of the categorical imperative on his view that rational beings have absolute value as ends in themselves (*FMM,* 45–6).

Although Kant's argument in support of this view of rational beings is not very clear, it appears to rely on two fundamental claims. Kant has elsewhere said that the only thing that is good without qualification is a good will (since anything else can be put to a bad end, but not good willing itself) (*FMM,* 9–10), and seems to allude to this position during the argument. He also begins the discussion of which this argument is a part by reminding his readers that only rational beings have a will (*FMM,* 44). From these two claims it is reasonable to conclude that rational beings are of absolute value because they are the only possible source of that which is good without qualification. An imperative with content can therefore be a categorical imperative, provided that the end of that imperative is for rational beings to be treated as ends. Thus, the second formulation of the categorical imperative is: "Act so that you treat humanity, whether in your own person or in that of another, always as an end and never as a means only"[4] (*FMM,* 46). This imperative includes an absolute prohibition against treating others as means only, and to do so would violate a perfect duty. It also requires one actively to treat others as ends, and this requirement is an imperfect duty. A reconsideration of the examples introduced earlier will help make this clear.

Consider what happens when Mary makes a false promise to John, say to pay back a loan when, in fact, she intends to flee to Brazil. Mary has used John as a means for gaining the money she needs to go to Brazil. It is true that virtually any time two people make an agreement they are treating one another as means, but the important thing is that when the agreement is honest they are not treating one another as a means *only*. When making an honest agreement, people know more or less how they are furthering the interests of another, and this furthering of the other's

interests is an explicit part of their own act. Thus, in honest agreements people treat one another as means, but they also respect one another as ends, insofar as the other has been able to make a free and informed decision as to whether to participate in the agreement. However, when Mary exploited John's trust by making a false promise, she treated him as a means only, in that he was not given the relevant information with which to decide whether he wanted to provide the benefit to Mary that she actually received. He was not treated as an end at all, in that he was not provided the opportunity to embrace the results of their interaction as an end of his own. Thus, Mary violated a perfect duty by treating another rational being, not as an end, but as a means only.

Now imagine that Mary is a botanist fascinated by, and extremely talented at, studying tropical deforestation, and she asks John, who won $50 million in the lottery, to help fund a research trip to Brazil. Here there is no question of perfect duties. Neither Mary's request for support, nor John's either providing it or refusing to do so, entails treating a rational being as a means only. But should John provide the support? Were John to provide the funding, he would be treating Mary as an end, insofar as he would be acting to facilitate her realization of her own ends. Of course, as was pointed out in the previous discussion of imperfect duties, it is not humanly possible for one's every action to be one of actively treating (in the sense of furthering) others as ends. Nevertheless, there is an imperfect duty to hold the principle of actively treating or furthering others as ends, and to act on this principle in appropriate circumstances. John may not be specifically required to provide funding for Mary, but he does have an imperfect duty, in a range of circumstances that seem appropriate to him, to use his personal resources to actively treat or further other rational beings as ends. Thus, it is a perfect duty never to treat oneself or another rational being as a means only, and an imperfect duty to actively treat or further all rational beings as ends in themselves.

The third formulation of the categorical imperative, the principle of autonomy, and duty

Although Kant expresses his third formulation of the categorical imperative in a number of ways, its clearest statement may be in the "principle of autonomy." According to this principle one is only subject to the moral law that one has legislated for oneself: "Never choose except in such a way that the maxims of the choice are comprehended as universal law in the same volition" (*FMM,* 57). Although this principle seems quite similar to the first formulation of the categorical imperative, the important

difference is that this principle requires one to think of the universal laws as issuing from one's own volitions, and thus that the constraints to which one is subject come from one's own will. Kant's point is that rational beings are not merely subject to the moral law, but subject to the law because they created it themselves, i.e. because the law comes from their own will.

To understand the importance of autonomy for morality one must consider Kant's views on "good will" and "duty." While other things might be good toward one end or another, or when employed in one way or another, Kant says that the only thing that is good without qualification is the good will (see *FMM,* 9–10). Kant then reveals the nature of the good will in a discussion of duty (see *FMM,* 12–15). Kant argues that acts do not have moral worth merely because they accord with duty, but only if they are done from (the motive of) duty. For example, if a shopkeeper gives a young child the correct change because they know that it is good for business, or even if someone helps another in need because they like to be helpful, although the acts accord with duty, they have no true moral worth. Kant is not saying that it is bad for people to behave in these ways, but only that they do not warrant *moral* esteem. In all the cases in which people behave in accord with duty, but for reasons other than just the requirements of duty, the person is moved by some particular interest, even if it is only the good feeling that they get inside. In all of these cases the person is acting out of some particular interest, and not merely manifesting a good will. The good will is only manifest when one does one's duty, not from any particular interest, but precisely because it is one's duty.

Now the importance of the principle of autonomy can be clear. Imagine that rational beings were subject to a moral law that they had not created for themselves. If the moral law did not come from the rational being's own will, then there would have to be some influence external to this being that moved it to act in conformity to the law. Obedience to the moral law would then be conditional on rational beings responding in a certain way to this external influence. For Kant, however, this would be antithetical to morality. Obedience might accord with duty, but it would not be from duty, it would not manifest a good will, and it would have no true moral worth.

Kant concludes that the principle of autonomy expresses the fundamental claim of his moral theory:

> That the principle of autonomy, which is now in question, is the sole principle of morals can be readily shown by mere analysis of concepts of morality; for by this analysis we find that its principle must be a categorical imperative and that the imperative commands neither more nor less than this very autonomy.
>
> (*FMM,* 58)

The concept of morality entails the idea of an absolute law, and, therefore, the fundamental moral principle must be a categorical imperative. But when one thinks about this imperative one recognizes that, since the imperative must be absolute, it cannot be based on anything of contingent interest. This requirement eliminates all principles that have their source outside of the individual, and leaves only the principle of autonomy.

Why people are subject to the categorical imperative

So far it has been shown that if there is such a thing as morality, then its rule is expressed by the categorical imperative (in all of its alternative formulations) that Kant has provided. What has not been shown is that beings like ourselves are subject to this morality. Kant has shown that it is essential to the concept of the categorical imperative, through the principle of autonomy to which it leads, that, if there is to truly be a categorical imperative, then it must be adopted by rational beings for themselves. But why would rational beings adopt the categorical imperative? Kant's answer is that, insofar as rational beings take themselves to be rational, they necessarily recognize the categorical imperative as a constraint upon themselves. Kant is saying that a necessary component of the self-image of rational beings is their recognition of the fact that they must constrain themselves in accord with the categorical imperative. Here again one can see that Kant is using an *a priori* argument based on the concept "rational being" to support his moral theory.

Kant's transcendental argument for his moral theory takes the following form. First he argues that there is a relationship between freedom and autonomy such that all beings who consider themselves free must accept the principle of autonomy, which, as was previously discussed, entails the categorical imperative (*FMM,* 64). Then he shows that rational beings, because of how they experience the world, and, specifically, their own activity in the world, must consider themselves free (*FMM,* 65). Thus, it follows that rational beings must think of themselves as constrained by the categorical imperative. An explanation of this transcendental argument for the categorical imperative best begins with an account of his view of freedom.

Rational beings have wills, and they cause things to happen in the world through their wills. Kant says of the will of rational beings that

> freedom would be that property of this causality by which it can be

> effective independently of foreign causes determining it, just as natural necessity is the property of the causality of all irrational beings by which they are determined to activity by the influence of foreign causes.
>
> (*FMM,* 63)

This is Kant's view of negative freedom, i.e. freedom from determination by something external to the will. The idea is that if one's will is free in this negative sense, then, as opposed to existing merely as a sensible or physical being, subject to strict causal determinism, one must also exist as an intelligible or purely rational being that can have effects on the world independently of any foreign influences one experiences.

Kant claims that this negative conception of freedom opens the door to a positive one. Kant has said that the will is a kind of causality that, free in the negative sense, is not determined by foreign influences. One must recognize, however, that "the concept of a causality entails that of laws according to which something (i.e. the effect) must be established through something else which we call cause" (*FMM,* 63).

So how is a will that is free in the negative sense determined? It is clear from the concept of "causality" that a free will must be determined in accord with some law. This is also confirmed by common sense. To imagine a will that is not determined in accord with some law, is to imagine a will that is random. But a being whose will appears to be random is not thought of as free, but is ushered away by people in white coats. Such a will does not accord with the concept of "freedom."

To be free, therefore, a will must be determined in accord with some law. It cannot be determined by the laws of nature, for determination by the laws of nature is exactly what accounts for the lack of negative freedom in sensible or physical beings. Thus, a will that is free in the positive sense must determine itself, it must act in accord with a law that it adopts for itself, a law of freedom. This, however, is exactly what it is to be autonomous, and therefore to recognize oneself as subject to the categorical imperative. After all, the categorical imperative is the only principle of the will that beings can adopt for themselves, since all other imperatives are based on ends that are of contingent value, and, thus, entail rational beings' determination by things external to themselves. Kant concludes this discussion by stating that "a free will and a will under moral laws are identical" (*FMM,* 64).

Kant still hasn't shown either that rational beings have free wills, or that there are any beings in the world that are subject to the morality that he has described. What has been shown is that only free beings can be subject to morality, and, more importantly, that all beings that think of themselves as free must think of themselves as subject to morality. Thus, if

Kant demonstrates that rational beings necessarily think of themselves as free, then he will have shown that rational beings must think of themselves as subject to the categorical imperative. And if this demonstration is based on the way that rational beings necessarily experience themselves in the world, then Kant will have provided a transcendental argument that rational beings are subject to the categorical imperative. So the question is: Do rational beings experience themselves in the world in a way that requires them to think of themselves as having a free will?[5]

What is it to think of oneself as a rational being? To think of oneself as rational is to think that one applies reason (competently) when making judgments. The following is an example of applying reason when making a judgment: If a rational being knows that if statement P is true then statement Q is true, and also knows that P is, in fact, true, then, if it actually manifests its rationality, it will conclude that Q is true, through the application of a certain, in this case obvious, principle of logic. A being that came to hold that Q is true without having applied the principle of logic, say because Q just popped into its mind, would not be thought of as having made a rational judgment (regardless of the truth of its belief). Furthermore, even a being who applied the principle of logic, if it did so out of instinct, or because it was forced to by some external power, would not be thought of as having (itself) made a rational judgment. Calling a judgment rational, and, by extension, a being rational insofar as it makes rational judgments, is only appropriate when the being has itself adopted and correctly applied the relevant principle of logic. If the being does not do this for itself then it is like a simple computer (one for which there is no question of artificial intelligence). It never deserves credit for the conclusions that it draws because its application of logical principles is solely the result of forces external to itself, e.g. the skill of its programmer.

Thus, with respect to logical judgments, a being can only think of itself as rational if it thinks that it has adopted and applied the principles of logic for itself. Of course, one can adopt and apply these principles for oneself only if one is free in Kant's positive sense. Thus, to think of oneself as rational, at least in one's logical judgments, one must think of oneself as free, and as having freely adopted the laws of logic. Nevertheless, although one must *freely* adopt these laws if one is to think of oneself as rational, that does not necessarily mean that one could adopt some other laws of logic and still think of oneself as rational. It is quite possible (though there are some who would question this claim) that there is only one set of fundamental logical laws that one can adopt without belying one's rationality. One's freedom is still manifest, however, by the fact that one has adopted the laws of logic for oneself, even though there is only one set of logical laws that one can adopt as a rational being.

The situation with regard to morality is analogous. To consider oneself possessed of practical reason, i.e. to think that one applies reason in determining one's will and consequently one's actions, one must think of oneself as freely adopting one's principles of action. In other words, one must think of oneself as having a free will. However, the fact that one must be free in adopting one's principles of action does not mean that there must be some range of options for one to select from among. As appears to be the case with logic, in the case of morality, there is exactly one fundamental principle of action that can be freely adopted, and that is the categorical imperative.

These considerations lead to a common confusion with respect to Kant's views on freedom, which can be expressed in the following question: How is it possible for one both to be free and to *have* to adopt the categorical imperative? This question manifests a misunderstanding of what Kant means by freedom. By freedom Kant does not mean the option of choosing one thing or another (which one might also call liberty), but rather, the power of self-determination (which can also be called autonomy).

Kant's point is that if the moral law is truly to be freely adopted, then it cannot get its force from any contingent conditions external to the individual. However, the only principle of action that is independent of determination by any contingent external influences is the categorical imperative. Therefore, insofar as one thinks of oneself as a rational being, possessed of practical reason, one must think of oneself as subject to the categorical imperative.

A second common confusion with respect to Kant's views on freedom is that he thinks that people are free only when they act in accord with the categorical imperative. The concern is that Kant is claiming that people are not acting freely on those occasions when they succumb to the influence of their inclinations and act contrary to the categorical imperative. If this were true it would raise quite a problem, because it entails the claim that people who act immorally are not free, and therefore cannot be held responsible for their actions. Kant, however, thinks of all rational beings as free insofar as they recognize the categorical imperative as a constraint upon their actions. Those who violate this constraint, insofar as they are rational, recognize that they have done wrong exactly because they recognize the categorical imperative as a proper constraint upon their wills (*FMM,* 41). A being who violates the categorical imperative, and does not recognize that it has done wrong, must not have adopted the categorical imperative as a constraint upon its will. Such a being cannot think of itself as rational. Thus, the categorical imperative expresses the definitive principle of how rational beings ought to act.

PART II: KANT'S POLITICAL PHILOSOPHY

In his political writings Kant builds upon the foundations he established principally in his moral philosophy to provide a rather strong argument supporting the necessity and the legitimacy of the state. In particular, he argues that there must be a single institution among a people, which he calls the state, that has the authority to use coercion to force people to leave others free to formulate and pursue the ends of their choice, provided that they are not violating the similar freedom of another. Kant argues both that morality requires people to exist within a state that secures their freedom to formulate and pursue the ends of their choice, provided that they do not violate the similar freedom of others, and that morality permits people to use coercion to force others to be members of such a state.

Kant suggests that his argument for the state grows out of the consideration of how human beings are actually to apply the categorical imperative (*MM,* 16).[6] Nevertheless, this approach does not reveal all of Kant's concerns in his argument for the state. Accordingly, I will also discuss Kant's argument that people necessarily view themselves as having a certain role to fulfill in the world, and that they can only perform this role successfully if their freedom to formulate and pursue the ends of their choice is secured within a state.

The domain of jurisprudence, the ends of nature, and the value of external freedom

Kant's *Metaphysics of Morals* addresses the issue of how the categorical imperative is to be applied by human beings. This work is divided into two parts: the "Doctrine of Right," in which Kant expresses much of his political philosophy, and the "Doctrine of Virtue," which is concerned exclusively with other aspects of his moral philosophy. Ostensively, the basis for Kant's division of the work is the difference between duties of justice, juridical (legal) duties, and duties of virtue, ethical duties (*MM,* 18–21). Kant says that all legislation (juridical and ethical) consists of two elements: the law, and the incentive to obey the law.

Although two different types of legislation may agree about the law, e.g. both juridical and ethical legislation may prohibit murder, they can at the same time differ with respect to their incentives:

> If legislation makes an action a duty and at the same time makes this duty the incentive, it is *ethical*. If it does not include the latter

> condition in the law and therefore admits an incentive other than the Idea of duty itself, it is *juridical*.
>
> (*MM,* 19)

Kant is distinguishing ethics, according to which one must always do one's duty exactly because it is one's duty, and never for any other reason, from jurisprudence, according to which one can have some other incentive for one's actions that fulfill one's duties. In fact, Kant begins the "Doctrine of Right" by defining jurisprudence as "the body of those laws that are susceptible of being made into external laws, that is, externally legislated" (*MM,* 33)[7] Thus, one must determine exactly what laws can be externally legislated.

First we should consider the difference between perfect and imperfect duties, and whether the laws that correspond with each of these can be externally legislated. Perfect duties require the performance or nonperformance of specific actions. It is easy to imagine how laws corresponding to these duties could be externally legislated, as it is easy to imagine how external incentives could be employed to coerce people either to perform or to refrain from performing specifie actions.

It seems impossible, however, for external incentives to be employed to coerce people to perform imperfect duties (*MM,* 45). After all, imperfect duties require people to adopt certain principles (e.g. beneficence), and to act on those principles in circumstances that they deem appropriate. But people cannot be coerced either to adopt principles or to act on them. Since people's wills are always free, and adopting a principle is an act of will, people cannot be forced to adopt principles. Furthermore, although people can be coerced to perform acts that follow from specified principles, since the act is merely a response to the coercion, it cannot be construed as an attempt to act in accord with the specified principle. Thus, people cannot be forced to act on a principle. Therefore, only imperfect duties can be the subject matter of jurisprudence, imperfect duties cannot.

It might appear, then, that all perfect duties can be addressed by jurisprudence. Actually, however, there is good reason to believe that Kant means to exclude perfect duties to oneself from the domain of jurisprudence.[8] One clear statement to this effect follows: "The concept of justice…applies only to the external and—what is more—practical relationship of one person to another" (*MM,* 34). One can best understand Kant's political philosophy, and specifically his exclusion of perfect duties to oneself from the domain of jurisprudence, by considering the broadest concerns that motivate him to write about the state.

In a number of his writings, including some essays on history and, more importantly, the *Critique of Judgment,* Kant reveals a great concern for the development of humanity. In the *Critique of Judgment,* Kant's interest in the development of humanity is revealed in the context of an extended discussion of teleology or purpose. He argues that people can

only make sense of a thing insofar as they understand it in terms of its purpose (*CJ,* 280).[9] The notion of a thing having a purpose, however, is ambiguous, raising two issues, each of which is relevant (*CJ,* 312–13). Something can be organized in a way that manifests a purpose internal to the entity, as a tree is organized to grow and reproduce, or the manifest purpose can be external to the entity, as a tree is organized to help maintain the proper oxygen level in the atmosphere for animals to survive.

When the question of purpose is asked of nature itself, the answer is quite revealing about humanity. Kant thinks that the ultimate internal purpose of nature is human culture, by which he means the ability of human beings, as sensible or physical beings constrained by the laws of nature, to formulate and pursue whatever ends they may set for themselves (*CJ,* 317–21). But human culture in this sense can only develop if people are secure from others interfering with their ability to formulate and pursue the ends of their choice. Thus, the greatest development of human culture, the ultimate end of nature, can only be realized if people do not violate their perfect duties to others ("UH," 45–6).[10] However, since the violation of perfect duties to oneself would also inhibit the development of human culture, it is not yet clear why Kant restricts the role of the state to include the enforcement of only perfect duties to others.

Kant's reason for excluding perfect duties to oneself from the domain of jurisprudence is revealed through the consideration of his views on the final external purpose of nature (*CJ,* 322–3). The final external purpose of nature can only be manifest in something that makes use of nature, but is not itself a part of nature, i.e. is not subject to the laws of nature, otherwise it would merely be one more internal purpose of nature. It is human beings, insofar as they are intelligible, or purely rational, beings subject to the moral law, who provide the final purpose for all that exists within nature. However, to the extent that people are not acting on the moral law, but are responding to their inclinations, nature is not being used toward any ends that themselves come from outside of nature. Thus, the final end of nature is only realized to the extent that humanity has developed toward moral perfection.

Kant, however, thinks that the final end of nature cannot be realized so long as people remain in the state of nature because morality is necessarily inefficacious when people remain in this condition. Among people who choose to remain in the natural condition, without a state that enforces the fulfillment of perfect duties to others, it is as if they have agreed with one another that anything goes:

> If men deliberately and intentionally resolve to be in and to remain in this state of external lawless freedom, then they cannot wrong each other by fighting among themselves; for whatever goes for one

> of them goes reciprocally for the other as though they had made an agreement to that effect.
>
> (*MM*, 72)

In such circumstances, there is reason to believe that none of the duties that people have to one another will be fulfilled. Thus, only if there is a state that enforces the fulfillment of perfect duties to others is it possible that morality will develop to the point that all duties to others can regularly be fulfilled. Therefore, the existence of the state is viewed by Kant as a necessary condition for the development of morality.

It is now clear that Kant requires a state that enforces at least the fulfillment of perfect duties to others, but why should it not also enforce the fulfillment of perfect duties to oneself? The problem is that the enforcement of perfect duties to oneself would undermine the development of the moral character necessary among people who are to fulfill all of their ethical duties. Although the argument is too involved to pursue fully here, the basic point is that one's perfect duties to oneself are fundamental, and only one who truly fulfills these duties, i.e. fulfills them precisely because they are duties, can develop the character necessary for the fulfillment of all of their duties. But if one is coerced to fulfill these duties to oneself, instead of fulfilling them solely because they are one's duties, this will undermine the development of one's character as one who fulfills all one's duties.[11] Thus, although the external legislation of perfect duties to oneself may facilitate the realization of the ultimate end of nature, it would actually undermine the development of humanity toward moral perfection, the final end of nature. Kant's greatest interest, the development of humanity toward both the ultimate and final ends of nature, can be realized only within a state that enforces the fulfillment of perfect duties to others, thereby securing people's external freedom and permitting them to formulate and pursue the ends of their choice, provided that they leave a similar freedom for others.

External freedom and the concept of justice

Having, at least briefly, explained Kant's non-political reasons for being concerned with securing people's external freedom, the foundation has been laid for showing how Kant argues within his political philosophy from the presumed value of external freedom to the necessity and legitimacy of a state that uses coercion to force people to fulfill their perfect duties to others. The outline of Kant's argument is as follows:

1 People have an innate right to external freedom.

2 The only legitimate limitation on this right to external freedom is the right of others to a similar freedom.
3 The condition of the universal realization of this right to external freedom is the condition of justice.
4 Justice entails the authorization to use coercion, as necessary, to support the condition of justice.
5 The innate right to external freedom entails both
   a the right to security in oneself, and
   b the right to possess things external to oneself.
6 Someone who remains in proximity, and in the natural condition relative to others, i.e. not in a state, interferes with their external freedom by not providing them a guarantee of security with respect to both
   a their right in themselves, and
   b their rightful possession of objects external to themselves.
7 Existing within a state, subject to juridical law, is the only way to guarantee this security to others.
8 It is just to use coercion to force anyone in proximity into a state, subject to juridical law.

Kant claims that there are two types of rights: innate rights and acquired rights (*MM,* 43). Innate rights belong to people by nature, independently of any act of law. Acquired rights, on the other hand, only come to exist through an act of law. Since acquired rights are dependent on acts of law, they cannot themselves provide the basis for considering people obligated to accept the lawful authority of a state. Any right that is to provide a legitimate basis for considering people obligated to accept the authority of a state must be an innate right. The innate right of external freedom plays this crucial role in Kant's argument for the necessity and the legitimacy of the state. Kant begins the section entitled "There is only one innate right" as follows:

> Freedom (independence from the constraint of another's will), insofar as it is compatible with the freedom of everyone else in accordance with a universal law, is the one sole and original right that belongs to every human being by virtue of his humanity.
>
> (*MM,* 43–4)

The innate right to external freedom, therefore, is the only right that can provide the justification for imposing a system of juridical law on others.

This innate right to external freedom provides the basis for Kant's conception of "justice," which he defines as "the aggregate of those conditions under which the will of one person can be conjoined with the

will of another in accordance with a universal law of freedom" (*MM,* 34). What are the conditions under which people's wills can be conjoined in accordance with a universal law of freedom? Kant thinks that two wills can be conjoined if they include no incompatibility. But what does this mean? Following Kant's description of willing as "the summoning of all the means in our power" (*FMM,* 10), two wills can be conjoined if each will, while summoning all of the means in its power applicable toward its end, does nothing incompatible with the activity of the other.

Suppose that two people will to hold the same political office. They will both summon all of the means that are in their power to gain this office, which, taken to its literal extreme, will undoubtedly include the violent elimination of their rival. In this case their wills cannot be united since each of them, by seeking to eliminate the other, is acting in a manner that is incompatible with the other's pursuit of the goal. It is not possible for them jointly to will that they act in the manner described, since it entails both of them willing their own death, and also willing to survive after the death of the other.

The question of justice, however, is not merely whether their wills can be conjoined, but whether they can be conjoined in accordance with a universal law of freedom. This restricts the range of maxims upon which they can will to act to those that are in accord with the universal law of freedom, which, for human beings, is expressed in the categorical imperative. If the rivals restrict their wills to maxims that meet this requirement, then they each will act on no maxim (employ no means) the universalization of which would be incompatible or inconsistent with the freedom of the other to act on similarly acceptable maxims. If the politicians so restrict themselves, then all of their acts, e.g. distributing buttons, or advertising their virtues on television, will be compatible with the like freedom of others. Their wills can be conjoined since there is no incompatibility or inconsistency between their willing to act in this restricted manner, and others willing to act similarly.

Although it was made to seem above, during the discussion of the universal law of freedom and its relationship to the categorical imperative, that justice requires one to act fully in accord with the categorical imperative, it is clear from Kant's definition of justice that it is limited to perfect duties to others. The exclusion of duties to oneself is clear from the reference to conjoining the will of one person with the "will of another." The exclusion of imperfect duties is entailed by the reference to the conditions in which one person's will "*can* be conjoined" with that of another. When asking if the wills *can* be conjoined, one is asking only whether it is logically possible for the maxims to hold at the same time, the test for perfect duties, not whether one could will them to hold at the same time, the test for imperfect duties.

With this understanding of Kant's conception of justice, it is easy to see that it amounts to nothing more than the condition of the universal realization of the innate right to external freedom. For all people to be independent of the constraint of others' wills, to the extent that this is compatible with the freedom of everyone else in accordance with a universal law, i.e. for the innate right to external freedom to be universally realized, requires neither more nor less than that people be in a condition in which their wills can be conjoined in accordance with a universal law of freedom, i.e. that people be in a just condition. Thus, if Kant can argue that the concept of justice logically entails the right to use coercion in support of the condition of justice, then he will have shown that there is no inconsistency in using coercion to support and maintain external freedom.

Kant wants to show that such coercion as is truly employed in opposition to injustice is itself consistent with justice (*MM,* 35–6). It follows from Kant's definition of justice that injustice would be *any condition* in which one person's will could not be conjoined with the will of another in accordance with a universal law of freedom. This condition cannot be eliminated, but can only be furthered, by an act that is itself unjust. Since every unjust act entails a will that cannot be conjoined with at least one other will in accordance with a universal law of freedom, every unjust act itself necessarily furthers the existence of the condition in which one person's will cannot be conjoined with the will of another in accordance with a universal law of freedom, i.e. the condition of injustice. Thus, any coercion that actually opposes the condition of injustice must, by definition, itself be just.

Kant goes on to argue that it is not merely just, but required by justice, to use coercion against anyone who acts unjustly (*MM,* 36–7). Of course, there are conditions on how that coercion is to be justly applied, but, assuming that these conditions are met, the application of coercion in support of the innate right to external freedom is itself a requirement of justice. It is particularly important to Kant, in light of the broadest concerns of his political philosophy, that external freedom can be supported by coercion. He is concerned with external freedom because it is a necessary condition for the development of humanity toward the final end of nature, moral perfection. But if people have to be moral to respect one another's external freedom, then Kant would have a circular argument in which the conditions for the development of morality were themselves dependent on morality. Kant needs the condition in which people respect one another's external freedom to be established entirely independently of the morality of the people. Thus, it is essential for Kant's argument that external freedom can be supported entirely by external legislation (independent of people's internal moral motivations).

The components of external freedom

Having shown that coercion can and ought to be used in support of the innate right to external freedom, the question of exactly what is entailed in this right must now be addressed. Based on his definition of the innate right to external freedom it is clear that Kant wants people to be independent of constraints that come from the will of others, when they are formulating and pursuing the ends of their choice in a manner consistent with others having a like freedom. It would seem then that Kant thinks that the innate right to external freedom entails independence from others *willfully acting* in a way that interferes with one's right to formulate and pursue the ends of one's choice. A right to this son of freedom may be commonly recognized, and may provide an adequate basis for a derivation of the necessity and legitimacy of the state. However, it is clear from Kant's argument for the state that he has a significantly stronger sense of "freedom" in mind. This freedom includes independence from others willfully acting in a way that interferes with one's right to formulate and pursue the ends of one's choice in a manner consistent with the similar freedom of others, but it also includes independence from otherseven *willfully maintaining a condition* that interferes with this right (see *MM*,35).

If he is to provide an *a priori* argument for the necessity of the state, Kant has to be concerned with the possibility of one's external freedom being interfered with by the conditions that others maintain, and not only by their actions. Kant's argument is dependent on the fact that someone who is in proximity, and in the natural condition relative to others, necessarily interferes with their external freedom. If Kant based his argument for the state on the fact that people will commit acts that interfere with the external freedom of others, then his argument for the state would be contingent on people actually committing such acts. Thus, Kant says:

> I am injured by the condition of other people who are in the natural state. For [when others remain in the natural condition] I have no security and my property is always in danger. I am not obligated to remain in this fear.[12]

Kant's point is that people who remain in proximity, and in the state of nature relative to others, interfere with others' freedom by interfering with both their security in themselves and their right to things external to themselves. Furthermore, one need not tolerate this situation of insecurity that undermines freedom, because people can be forced to join the state, the only condition in which freedom is guaranteed, without violating their freedom.

The last two sentences constitute, in effect, a restatement of steps 5–8 of Kant's argument as outlined above. According to the innate right to external freedom, people have the right to formulate and pursue the ends of their choice, provided that they leave a similar freedom for others. Kant thinks that this right entails both the right to security in oneself and the right to possess things external to oneself.

Any violation of one's right in oneself, which would seem necessarily to involve some son of assault, clearly entails the victim's being constrained by the will of another (the perpetrator). Furthermore, Kant thinks that even the threat of a violation of one's right in oneself interferes with one's external freedom, as Hobbesian reasoning reveals. If people are in fear for their personal security, they will have to focus a great portion of their efforts on securing themselves, and will not be able to formulate and pursue those ends that truly interest them. Thus, the innate right to external freedom entails the right to security in oneself.

The explanation of why the innate right to external freedom entails the right to possess things external to oneself is much more complicated. One simple explanation that Kant alludes to at times is that human culture is advanced through people engaging in complex projects, but people will only engage in such projects if they have a fixed expectation of their efforts being undisturbed, and of being able to work from the results of earlier efforts in subsequent, more involved projects. Thus, the right to possess things external to oneself is necessary for the development of human culture, the ultimate end of nature. Kant's more complicated explanation of the right to property is basically that freedom can only be restricted to preserve the like freedom of others, owning property does not restrict the like freedom of others, and, therefore, freedom includes the right to own property. Thus, to restrict the possibility of the rightful possession of things external to oneself is to restrict freedom for something other than freedom, which is necessarily inconsistent with the final end of nature (*MM,* 52–3).

The necessary conditions of external freedom

What remains to be shown is that anyone who remains in proximity, and in the natural condition relative to others, interferes with both of the rights that are entailed in the innate right to external freedom. First we shall look at Kant's argument that such an individual interferes with others' right to possess things external to themselves. Kant maintains that the right to possess anything, although land is the most important example, depends on a relationship of the wills of all those who are in

proximity (*MM*, 65). There are no material conditions, which could be verified empirically, that constitute having a right to a thing. Although Locke argued that one can make something one's property by mixing one's labor with it, Kant would respond that this begs the question, since it can now be asked: By what right does one mix one's labor with something?

Kant thinks that a person can rightfully possess something only if everyone in proximity relinquishes their right to will the use of that thing. Thus, one cannot take rightful possession of something through one's own will alone; there must be a union of wills manifesting the agreement of all to respect the property of each:

> Now, with respect to an external and contingent possession, a unilateral Will cannot serve as a coercive law for everyone, since that would be a violation of freedom in accordance with universal laws. Therefore, only a Will binding everyone else—that is, a collective, universal (common), and powerful Will—is the kind of Will that can provide the guarantee required. The condition of being subject to general external (that is, public) legislation that is backed by power is the civil society. Accordingly, a thing can be externally yours or mine only in a civil society.
>
> (*MM*, 65)

For Kant, existing within a state is the form in which the people express their mutual respect for one another's rightful possession of things external to themselves. What happens, however, if there are people in proximity, and in the state of nature relative to the others? These people are not parties to the union of wills by which each person's rightful possessions are guaranteed. These people are in a position to will the use of things that would otherwise be rightfully possessed by others. But since rightful possession depends on the agreement of the wills of all those in proximity, the presence of these people who are outside the union of wills makes rightful possession impossible, thereby interfering with the freedom of those within the union. Thus, Kant concludes this discussion by saying that if rightful possession must be possible (and it is entailed in the innate right to external freedom), "then the subject must also be allowed to compel everyone else with whom he comes into conflict over the question of whether such an object is his to enter, together with him, a society under a civil constitution" (*MM*, 65). In summary, Kant argues that the innate right to external freedom includes the right to possess things external to oneself; that this right can only be realized within a state; that anyone in proximity and outside of the state interferes with this right; and, therefore, that it is just to use coercion to force such people to enter the state.

Kant also argues for the necessity and the legitimacy of the state from the fact that the innate right to external freedom entails a right to security in oneself that can only be realized within a state. While it is true that everyone has an ethical duty to respect everyone else's rights in themselves, nevertheless, since people have no way of knowing the intentions of others, they are not secure in their rights in themselves until such time as they guarantee to one another that they will respect these rights:

> The necessity of public lawful coercion does not rest on a fact, but on an a priori Idea of reason, for, even if we imagine men to be ever so good natured and righteous before a public lawful state of society is established, individual men, nations, and states can never be certain that they are secure against violence from one another.
>
> (*MM,* 76)

Kant's point is that, despite the requirements of morality, people's rights in themselves are insecure outside of a state. Paralleling his argument for the state from the right to possess things external to oneself, Kant argues here that the only way that the rights entailed in the innate right to external freedom can be realized is if people make their will not to violate these rights publicly known, and that the form of this mutual guarantee is the state.

Kant's argument that the necessity and the legitimacy of the state can be derived from the fact that people have the right to security in themselves is well summarized in the following:

> It is usually assumed that one cannot take hostile action against anyone unless one has already been actively *injured* by them. This is perfectly correct if both partics are living in a *legal civil state*. For the fact that one has entered such a state gives the required guarantee to the other, since both are subject to the same authority. But man (or an individual people) in a mere state of nature robs me of any such security and injures me by virtue of this very state in which he coexists with me. He may not have injured me actively *(facto),* but he does injure me by the very lawlessness of his state *(statu iniusto),* for he is a permanent threat to me, and I can require him either to enter into a common lawful state along with me or to move away from my vicinity.
>
> ("PP," 98 n.)[13]

The innate right to external freedom can be universally realized only within a state, in which each person guarantees this right of everyone else by participating in a union of wills resolved to use coercion in support of

this right. Furthermore, since it is just to use coercion in support of the innate right to external freedom, it is just to use coercion to force into the state those people who would otherwise maintain a condition that interferes with the external freedom of others (e.g. by remaining in proximity and outside of civil society).

Kant on international relations

Before discussing Kant's views on how one is forced to join a state, and the version of hypothetical social contract theory toward which these concerns lead Kant, it is interesting to consider the relationship between Kant's argument for the necessity of the state and his views on international relations. Kant has argued that people who remain in proximity, and in the natural condition relative to others, because they necessarily interfere with the freedom of those others, may therefore justly be forced to join together with them in a state that secures their freedom. However, what if these people are already members of a state, but a different neighboring state? Two related problems arise: First, the members of each state interfere with the freedom of the members of the other state just as they would if they were not members of a state at all: if there is no formal relationship between the states, there is no guarantee that the members of each state will respect the rights of the members of the other state. Second, the two states, which can each be thought of as a "moral person," are in the state of nature relative to one another, and suffer all the difficulties that led Kant to argue for the need for civil society.

Kant recognizes that these are serious difficulties which, unchecked, would very much undermine the possibility of the sort of human development that he thinks should be facilitated. His solution to the problem is to suggest that the same forces that lead individuals into a state should lead states into a federation of states ("PP," 102–5; "UH," 47; "TP," 90).[14] This federation of states would then fulfill the same role among states that a state fulfills for its citizens, and would also provide the necessary guarantee of external freedom among the citizens of different states.

Although it is clear what Kant provides through his suggestion of a federation of states, there is also a significant problem raised by this suggestion: Who is ultimately sovereign? Since Kant argues that for a state effectively to fulfill its role it must be ruled by an absolute sovereign, it would seem to follow that the federation of states can effectively fulfill its role only if it is ruled by an absolute sovereign. Thus,

it appears to be a clear implication of Kant's argument that there should be a single world nation, without lesser sovereign states. However, Kant never supports the notion of a single world state, and at one point discusses the concern that such a world state "may lead to the most fearful despotism" ("TP," 90). Thus, while Kant was right to recognize that his argument for the necessity and the legitimacy of the state has important implications for international relations, he was never able to give a clear and satisfactory account of how those international relations should be organized.

Kant's hypothetical social contract theory

Kant has shown that people who remain in proximity, and in the natural condition relative to others, can be forced to join together with others in a state. Before one can understand what Kant thinks is entailed in forcing someone to join a state, one must understand what Kant thinks is entailed in being a member of a state, and how this membership is manifest. These issues are all addressed by what might best be described as a hypothetical social contract theorist.

Kant's hypothetical social contract theory follows from his *a priori* reasoning about human beings, and his recognition of both the rights of human beings, and the impossibility of realizing those rights outside of a state:

> A state *(civitas)* is a union of a multitude of men under laws of justice. Insofar as these laws are necessary a priori and follow from the concepts of external justice in general (that is, are not established by statute), the form of the state is that of the state in general, that is the Idea of the state as it ought to be according to pure principles of justice. This Idea provides an internal guide and standard *(norma)* for every actual union of men in a commonwealth.
>
> (*MM*, 77)

Kant is concerned with the Idea of the state, which is based on *a priori* necessary laws of justice, and thus ought to serve as the blueprint for all actual states. It is the possibility of deriving the state *a priori* that grounds the possibility of a hypothetical social contract theory.

Kant is a social contract theorist, maintaining that one's political obligations can only result from one's having consented, along with others, to be subject to the authority of the state. Kant, however, departs from the more traditional social contract theorists in that he does not

think that this consent is actual, either explicit or tacit. Thus, Kant's social contract theory is best described as hypothetical, to distinguish it from those theories according to which people must actually manifest their consent through their behavior. Under Kant's hypothetical social contract, human beings can be treated *as if* they have consented to the social contract, because their consent is a necessary manifestation of their humanity, i.e. it is known *a priori* that, inasmuch as a being is rational, and one to whom the concept "human" applies, this being necessarily consents to the social contract. Thus, Kant says that being a member of a state is a "requirement of pure reason, which legislates *a priori*" ("TP," 73).

It is in accord with this pure reason that people are parties to the social contract, and organize themselves into a state. Being organized into a state, however, does not require that individuals actually apply their own reason and recognize the necessity and the legitimacy of the state; rather, the state is legitimate because *a priori* reason reveals it to be so: "The act by means of which the people constitute themselves a state is the original contract. More precisely, it is the Idea of that act that alone enables us to conceive of the legitimacy of the state" (*MM,* 80).

Kant places himself in the contract tradition through his reference to the "original contract." However, he then avoids any reliance on the actuality of this contract, and introduces what I have called a hypothetical social contract theory. It is not any actual social contract, to which people have actually consented either explicitly or tacitly, that lies at the foundation of the state and accounts for its legitimacy. Rather, it is the "Idea" of the original contract, a necessary idea of *a priori* pure practical reason that must, therefore, necessarily be assented to by all human beings inasmuch as they manifest their rationality, that provides the foundation of the state, and accounts for its legitimacy.

All that is required for one to be a member of a state, remembering that it requires no actual consent, is to exist in a condition in which each individual has the rights and obligations that are necessary for the maintenance of a just condition, and which are enforced by the state through coercion. In fact, Kant argues that even if the state does not enforce exactly those rights and obligations that are necessary for the maintenance of a just condition, people must still accept its authority (for reasons that will be revealed shortly). In any case, membership in the state amounts to nothing more than the fact that citizens have an obligation to obey the law, and will be punished if they do not. There is nothing that manifests citizens' membership in the state save the fact that *a priori* pure practical reason requires people, as intelligible beings, to subject themselves to this system of laws, and that people, as sensible or physical beings, are actually subjected to the authority of the state.

What about those people existing either within the borders of the state, or otherwise in proximity, who, as intelligible beings, do not recognize the *a priori* practical necessity of subjecting themselves to the authority of the state, and, therefore, as sensible or physical beings, do not necessarily obey the authority of the state? Kant has said that such people can be forced to join the state. But, since there is no particular behavior by which people actually manifest their consent to the social contract, there is no act that people can be forced to perfom that will manifest their joining the state.

In the end, what it is to force such people to join the state can be seen by considering why it is necessary to do so. The fact that such people, as intelligible beings, do not recognize the *a priori* practical necessity of the state is irrelevant, since justice is concerned with only the external relations among persons. The fact that such people, as sensible or physical beings, do not obey the authority of the state, however, means that, were they members of the state they would have been subjected to coercion, as necessary, to maintain the condition of justice. Membership in the state amounts to nothing more than being subject to the threat of coercion in response to violations of the law. Kant's claim, that people who do not accept the authority of the state should be forced to join the state, really amounts to the claim that, in accord with the hypothetical social contract that they necessarily accept insofar as they are rational beings, they should be treated as members of the state.

Kant on rebellion and resistance

Kant has argued from the fact that people have an innate right to external freedom, and the fact that this freedom is not violated by the use of coercion against someone who is violating the freedom of another, to the fact that people can be treated as if they were parties to an original contract by which they agreed to accept the authority of the state. The idea of an original contract, however, not only explains the political obligations of the members of a state, but also accounts for the limitations that exist on the authority of the state:

> [The original contract] is in fact only an *idea* of reason, which nonetheless has undoubted practical reality; for it can oblige every legislator to frame his laws in such a way that they could have been produced by the united will of a whole nation…. This is the test of the rightfulness of every public law. For if a law is such that a whole people could not *possibly* agree to it…it is unjust; but if it is at least

> *possible* that a people could agree to it, it is our duty to consider the law as just, even if the people is at present in such a position or attitude of mind that it would probably refuse its consent if it were consulted.
>
> ("TP," 79)

The idea of the original contract, to which all human beings, insofar as they are rational, necessarily consent, includes restrictions on the possible legislation of a legitimate state. Basically, legislation is legitimate if it would be possible for the people to consent to it. The fact that the people would be likely to choose not to consent to a given piece of legislation is not relevant to its legitimacy, provided that it does not require the violation of a perfect duty, and, thus, could at least possibly receive the people's consent.

Accordingly, it would not be surprising if Kant went on to argue that rebellion and resistance against a state whose laws are legitimate is absolutely prohibited, but that it is permissible to rebel against a state that passes unjust legislation, or at least to resist the specific unjust laws. Such a position would be consistent with the fact that Kant, on certain grounds, applauded the French Revolution. This line of reasoning is also supported by a passage in which Kant implies that resistance to illegitimate legislation, which requires the violation of a perfect duty, is permissible, or even required: "When men command anything which is itself evil (directly opposed to the law of morality) we dare not, and ought not, obey them."[15] Despite this apparent endorsement of resistance to unjust legislation, however, Kant repeatedly states that rebellion against states that enact unjust legislation, and resistance to illegitimate legislation, are both absolutely prohibited. At first blush this is rather surprising. After all, Kant's interest in the state is grounded in his concern for the development of morality, which fundamentally entails the autonomy of the individual, and, yet, submission to an unjust state seems undeniably to entail the violation of morality and the denial of individual autonomy. Nevertheless, Kant's arguments for the absolute prohibition against rebellion and resistance are well grounded in his most fundamental concerns.

Kant's absolute prohibition against rebellion and resistance, while holding a theory of illegitimate legislation, is evident. He says that "the people too have inalienable rights against the head of state, even if these cannot be rights of coercion" ("TP," 84). Kant both recognizes that there are things beyond the legitimate authority of the state, and asserts that the people cannot use coercion in response to such transgressions. The absolute nature of this prohibition is stated unequivocally: "it is the people's duty to endure even the most intolerable abuse of supreme authority" (*MM,* 86). Another passage both expresses this absolute prohibition, and begins to reveal Kant's justification for it:

> It thus follows that all resistance against the supreme legislative power, all incitements of the subjects to violent expressions of

> discontent, all defiance which breaks out into rebellion, is the greatest and most punishable crime in a commonwealth, for it destroys its very foundations. This prohibition is *absolute*.
>
> ("TP," 81)

Kant not only thinks that the prohibition against rebellion and resistance is absolute, but that it must be absolute, because rebellion and resistance destroy the very foundations of a state. Even a state that is unjust must be supported because the state is necessary for the realization of the innate right to external freedom, and to rebel or resist any state is to act on a maxim that makes all states insecure:

> For such resistance would be dictated by a maxim which, if it became general, would destroy the whole civil constitution and put an end to the only state in which men can possess rights.
>
> ("TP," 81)

> For such procedures, if made into a maxim, make all lawful constitutions insecure and produce a state of complete lawlessness *(status naturalis)* where all rights cease at least to be effectual.
>
> ("TP," 82)

In his political philosophy, Kant argues for the necessity and the legitimacy of the state because, without a state, the rights that people have under the innate right to external freedom cannot be secured, and humanity will not progress toward the ultimate and final ends of nature. Rebellion and resistance, however, entail the adoption of maxims that make the state impossible, rights ineffectual, and the hope for human progress vain. Thus, it is only if people live within secure states, that are themselves members of a healthy federation of states, that humanity can possibly progress toward the ultimate and final ends of nature, the complete development of human culture and the attainment of moral perfection.

NOTES

1 For Kant these identities are necessary, thus obviating the claim that he is substituting into an intentional context.
2 *FMM* stands for Kant, *Foundations of the Metaphysics of Morals,* 2nd edn, revised, trans. L.W.Beck (New York: Macmillan, 1959).
3 Kant wouldn't consider this correspondence mere coincidence, but space does not permit a discussion of its grounds.

4 It is clear that by "humanity" here Kant is referring to rational beings generally.
5 Kant argues only that insofar as we think of rational beings as actors in the world, i.e. from the point of view of practical philosophy, can we argue that these beings are free. This argument does not constitute a theoretical proof of the freedom of rational beings.
6 *MM* stands for Kant, *The Metaphysics of Morals,* the Preface, Introduction, and most of Part I ("Doctrine of Right") of which constitute *The Metaphysical Elements of Justice,* trans. J.Ladd (New York: Macmillan, 1965).
7 The word that is here translated as "jurisprudence" is the same word as is translated "doctrine of right," but the former corresponds to colloquial English. Furthermore, the root of this word, *"Recht,"* can be translated as either "right" or "justice" depending on the context. Thus, the "Doctrine of Right," Kant's theory of jurisprudence, is concerned with those duties that are duties of justice.
8 There is rather good evidence both for and against this claim; however, I think that much better sense can be made of Kant's political philosophy on the assumption that it is correct.
9 *CJ* stands for Kant, *Critique of Judgment,* trans. W.S.Pluhar (Indianapolis: Hackett, 1987).
10 "UH" stands for Kant, "Idea for a Universal History with a Cosmopolitan Purpose," in *Kant's Political Writings,* 2nd edn, ed. H.Reiss, trans. H.B.Nisbet (Cambridge: Cambridge University Press, 1991).

CHAPTER 4

Kant: *Critique of Judgement*

Patrick Gardiner

Kant's third *Critique,* the *Critique of Judgement,* was published in 1790 and was intended—as he himself put it—to bring his "entire critical undertaking to a close." So conceived, it was certainly in part designed to build upon and develop ideas that had already been introduced in its two predecessors but which he had come to regard as requiring further elaboration and supplementation. Thus Kant included in its ambitious scope wide-ranging discussions impinging upon the spheres of scientific enquiry, ethics, and religion, his aim being to approach these apparently diverse realms within a perspective distinguishable in significant ways from any he had hitherto adopted. At the same time, however, it should be recognized that the book was composed not only in the light of theses he had advanced in his own previous writings. For it may also be seen as involving responses or allusions to positions that had been put forward by other thinkers and which had attracted considerable attention among his contemporaries. This was especially true in the case of aesthetics, an area he had not so far subjected to systematic critical scrutiny; but they arose as well both from developments in the emergent biological sciences and from theoretical studies relating to history and to the nature of social change. Further, and at a more general level, Kant was sharply aware of recent contributions to the existing climate of opinion that had been made by philosophers who wished to challenge many of the rationalistic assumptions associated with the eighteenth-century *Aufklärung,* particularly those felt to threaten or undermine cherished dogmas of religious orthodoxy. All in all, German thought in the 1780s can be said to have been the focus of a variety of competing intellectual preoccupations and trends. Hence it is hardly surprising that his own treatise, appearing at the end of an ideologically turbulent decade, bore the imprint of current

controversies, some of which had indeed been sparked off by the publication nine years earlier of the *Critique of Pure Reason* itself.

The outcome of these disparate concerns and influences was a complex and seminal work. It was also, at least in certain respects, an elusive one. The sections into which the *Critique of Judgement* is divided fall into four main groups, each centering round a dominant topic or theme. But although the individual subjects treated are of great intrinsic interest, they are apt to strike the reader as belonging to markedly different categories; moreover, the actual manner in which some of the constituent sections are suppose to fit together is not always easy to discern. It may therefore be tempting to regard the book from one point of view as amounting to a series of somewhat loosely related essays rather than as representing a unified enquiry controlled by a single overarching objective. Nonetheless, Kant makes it pretty clear at the outset that this was not how he himself envisaged the project on which he was engaged. Instead, he presents it as following a course determined by, and closely integrated with, the overall plan informing his earlier investigations, the assumed connection deriving from the theory of mental powers or faculties in terms of which he tended to articulate the basic principles governing human thought and conduct. The functions of two of those faculties—namely, understanding and reason—had already been examined and their respective provinces charted. Thus in the Preface he writes that his first *Critique* was largely devoted to analyzing the role of the understanding in supplying the *a priori* principles essential to our cognitive experience; while in the second he demonstrated how reason—here identified in its practical employment as the source of moral prescriptions—performed a comparable *a priori* role in legislating at the level of human action and desire. He now maintains that a third faculty remains for consideration which forms "a middle term" between the other two and whose claims as a possible source of independent *a priori* principles have still to be assessed. The faculty in question is the power of judgment *(Urteilskraft),* the important issues its mediating position raises indicating that a further *Critique* is called for. Accordingly, and with the completion of his system in mind, it is this that Kant sets out to provide. Let us see how he proceeds, beginning with the contents of the formidable Introduction which in effect constitutes the first major division of his new work.

REFLECTIVE JUDGMENT AND THE CONCEPT OF PURPOSE

Kant wrote two Introductions to the *Critique of Judgement,* discarding the first as being "disproportionately extensive" and replacing it with the shorter version he decided to publish in its stead. Even in its abbreviated

form, however, it amounts to an involved and demanding piece of work, containing retrospective references to conclusions so far reached in his philosophy as well as anticipations of matters he intends to cover in the main body of the text that is to follow. Since it is in terms of the former conclusions that he offers a preliminary clue to what he conceives to be a guiding concern of the present *Critique,* it will be best to start with his somewhat condensed remarks in that connection. For they indicate that his conception of judgment as playing a mediating role between understanding and reason was intimately linked to a distinction which was fundamental to the doctrine of transcendental idealism propounded in his previous writings.

This was the radical contrast he had drawn between the realm of empirical phenomena, comprising reality as it appears to us as cognitive subjects endowed with a certain sensory and intellectual apparatus, and a postulated non-empirical realm of noumena or "things in themselves." So far as the phenomenal sphere was concerned, Kant had argued that our familiar awareness of a spatio-temporal and causally governed world of perceivable entities and events presupposed a framework of universal forms and categories which was imposed upon the data or raw material of sensation by the human mind. Such an *a priori* framework determined the basic structure of the empirical consciousness, constituting the conditions upon which all everyday and scientific knowledge depended for its possibility. At the same time, it must clearly be understood that any knowledge we might legitimately claim to possess of reality was confined to the sphere of observable nature, i.e. to what fell within the scope of sensory experience: it did not extend to the noumenal realm, the latter being a supersensible field that was necessarily inaccessible to theoretical cognition or investigation. However, it did not follow that the notion of the supersensible had no substantive part to play in our thought. On the contrary, Kant regarded it as being crucial to the conception we were obliged to have of ourselves when considered from a practical and, more specifically, a moral point of view. For here it was essential that we should think of ourselves as possessing free will and as being thereby able to act in compliance with practical imperatives prescribed by reason as opposed to following the natural promptings of sensuous impulse or inclination. Such a capacity for rational self-determination appeared to be excluded on the supposition that we belonged solely to the phenomenal domain, since on Kant's own principles everything occurring within that sphere was subject without exception to the laws of natural causality. On the other hand, the requirements of morality could be preserved if it were accepted that there were two aspects under which people might be viewed, the first of which involved treating them as items in "the world of sense" and the second of which involved regarding them as belonging to the "intelligible"

or supersensible sphere which necessarily lay outside the range of the causal categories that were universally applicable within the empirical realm. Thus, while from a theoretical standpoint we were indeed bound to consider ourselves as governed by natural laws, from the standpoint of practical motivation and choice we could at the same time consistently conceive of ourselves as exercising freedom and rational autonomy of the kind presupposed by the moral consciousness. Kant was careful to point out that the latter conception, depending as it did for its possibility upon our membership of the supersensible as well as the natural world, was not capable of being cognitively established; for nothing whatsoever could be *known* by us at the level of noumenai reality. Nonetheless, the "two-world" doctrine invoked might be said to leave room for the idea of human free will in a way that rendered it compatible with the acceptance of a fully deterministic account of nature, thereby resolving an antinomy commonly believed to arise between the claims of scientific enquiry and the presuppositions of ethical thought.

Problematic though it has often been felt to be, the above solution to this apparent conflict was certainly the one that Kant had adopted in his two preceding *Critiques*. And it recurs in the Introduction to his third inasmuch as he speaks there of theoretical understanding and practical reason as having "two distinct jurisdictions," neither of which need be thought of as interfering with the other—"it is possible for us at least to think without contradiction of both these jurisdictions, and their appropriate faculties, as coexisting in the same Subject" (Introduction, p. 13). However, although in the present context he briefly refers to this thesis as having been established in the *Critique of Pure Reason,* at the same time he indicates here that it leaves in its wake a further issue whose significance has still to be faced. For it raises the question of what connection, if any, may be presumed to exist between the spheres of natural necessity and practical freedom, given their supposed independence. Kant certainly writes of there being "a great gulf fixed" between the provinces to which the concepts of nature "as the sensible" and of freedom "as the supersensible" respectively apply, the first of these being "powerless" to exercise an influence upon the second. The fact remains nonetheless that the two realms cannot be thought of as totally insulated from each other, for it is a condition of moral agency that the principles and objectives which reason prescribes should be understood to be realizable in the phenomenal world, achieving expression within the empirical course of events. As he himself goes on to say: "the concept of freedom is meant to actualize in the sensible world the end proposed by its laws," and he holds it to follow that nature must be "capable of being regarded in such a way that in the conformity to law of its form it at least harmonizes with the possibility of the ends to be effectuated in it

according to the laws of freedom" (ibid., p. 14). In other words, we should be able, though without violating the principle of natural causality, to consider the phenomenal domain under an aspect that would allow us to view it as amenable to the behests and aims of morality; at the very minimum, it would not present itself as being wholly allen to the fulfillment of the latter. Such an aspect is specifically connected by Kant with the notion of a purposiveness or "finality" in nature which is supplied by the faculty of judgment; and it is in these terms that he envisages the possibility of judgment's providing a "mediating concept" or requisite link between the two modes of thinking—theoretical and practical—whose spheres of application he has found it essential to distinguish.

The implications of this suggestion, which Kant relates somewhat obscurely to his conception of phenomenal nature as itself having a "supersensible substrate" or noumenal ground, only appear at a later stage of the *Critique* where it is evaluated in the light of certain qualifications to which it is held to be inevitably subject. Within the context of the Introduction, however, its chief importance lies in its being the cue for him to initiate a general account of judgment and its functions. It is necessary to speak in the plural of its role, since Kant certainly regards the power of judgment as operating at more than one level of our thought and as being relevant to discriminable philosophical concerns. That, indeed, quickly becomes apparent from the discussion which directly follows and which actually forms the centerpiece of this section of his book. For there it is issues pertinent to scientific procedure, rather than questions arising from reflection on our moral experience, that immediately occupy him. Moreover, it is with reference to such methodological considerations that he first broaches the problem of what kind of *a priori* employment may legitimately be assigned to the mental faculty he has in mind.

Kant opens his account by making a preliminary distinction between what he respectively calls the "determinant" and the "reflective" dimensions of judgment. In both it is said to involve relating universals and particulars, but the manner in which it does so is radically different in the two cases. Thus judgment is asserted to be determinant when it involves applying a "given" universal—that is, a concept or general law known or presupposed in advance—to particulars recognized as falling under it: it was in this sense that Kant referred to judgment in his first *Critique,* where the relevant universals were the formative categories and principles of the understanding and where it was simply characterized as "the faculty of subsuming under rules." He now wishes to compare that capacity with another one in which the above process is, so to speak, reversed; here it is the particular, or particulars, that is or are given, the

task of judgment being taken instead to consist in seeking a universal beneath which the latter can appropriately be brought. Engaging in such a task is the business of reflective judgment, and it is with the operations of judgment so understood that Kant is presently concerned.

What does this amount to in less abstract terms? As we have seen, it was central to the standpoint Kant adopted in his critical philosophy that everything falling within the sphere of empirical reality conformed to an overall framework whose universal applicability to phenomena was transcendentally guaranteed. And, since the forms of order embodied therein were constitutive of all objective experience, it followed that they must be taken to hold of whatever occurred within the areas explored by the empirical or natural sciences. However, it was one thing to recognize the *a priori* validity for any experience of such a categorical principle as that every event must have a determining cause. It was quite another to discover *from* experience what particular causal laws or regularities actually obtain within a given domain and to try to identify their possible connections and interrelations. Neither enquiry can be undertaken without recourse to the findings of empirical observation and scrutiny, but Kant lays especial stress on the second as expressing something that he considers to be intrinsic to the very notion of scientific thinking. That is the idea of system.

The claim that "systematic unity is what…raises ordinary knowledge to the rank of science" had already been emphasized in the first *Critique* in connection with what was there called "the logical employment of reason." Here Kant takes it up, though with the difference that the exercise of judgment is implicitly substituted for that of theoretical reason. At the level of everyday life there are innumerable generalizations which reflect the "manifold forms of nature" and which may be said to contribute to the stock of our ordinary or commonsense knowledge of the world. Even so, a mere aggregate of such perceived regularities, however comprehensive, is never by itself sufficient to qualify as a science. To satisfy that description, and to meet theoretical requirements of the kind deemed essential to scientific understanding, it is necessary that the relevant empirical laws should be seen to constitute an interdependent and hierarchically related system; as Kant puts it, from this point of view it is essential to establish "the unity of all empirical principles under higher, though likewise empirical, principles, and thence the possibility of the systematic subordination of higher and lower" (Introduction, p. 19). And that leads him to formulate what he conceives to be a fundamental presupposition of scientific enquiry. For he goes on to maintain that to embark upon such a project is to proceed on the assumption that the multiplicity of naturel laws will be found to exhibit a unitary order which is intelligible to the human mind, so that it is as if "an understanding

(though it be not ours) had supplied them for the benefit of our cognitive faculties." Nature, in other words, must be approached as though its workings were purposively adapted to our intellectual capacities and powers of comprehension, this being a conception which he specifically ascribes to reflective judgment. And in so ascribing it he at the same time contends that it amounts to an *a priori* principle possessed of an independent validity in its own right.

Kant is insistent that the distinctive status of the principle in question, together with that of subsidiary "maxims of judgement" like those which attribute economy and continuity to nature's operations, should be fully appreciated. In his own terminology, it is not "constitutive": unlike the transcendental rules imposed by the understanding, it does not represent a necessary condition of phenomenal reality as such, being prescriptively related to our modes of empirically investigating nature rather than being objectively determinative of the natural realm considered in itself. Nor, Kant holds, does it justify us in affirming the existence of an actual designer in the form of a divine or superhuman intelligence responsible for harmonizing the natural world with the needs and capacities of our finite intellects. Instead it functions purely as a principle of enquiry which, while *a priori* in the sense of being something brought to rather than derived from experience, is only "regulative" or heuristic in character. Nevertheless, although we can never justifiably claim to know that nature objectively conforms to a purposively conceived order of the sort postulated, we are subjectively obliged even so to pursue our investigations *as if* it did. For otherwise scientific thought and research, conceived as a quest after system within the *prima facie* untidy conglomeration of facts and regularities that empirically confronts us, could not be meaningfully undertaken: "were it not for this presupposition we should have no order of nature in accordance with empirical laws, and, consequently, no guidingthread...for an investigation of them" (Introduction, p. 25). It appears, therefore, that a view of nature invoking purposive conceptions—which, as was intimated earlier, might ultimately be found to serve judgment as a means of mediating between the spheres of freedom and natural causality—can at least be said to have received positive, if limited, endorsement within the context of scientific methodology. For here it is taken by Kant to underlie, as an indispensable regulative idea, the general project of comprehending phenomena within a unitary scheme of interconnected laws. It has, moreover, a further implication to which he briefly alludes. For it follows from the account he has given that, although as scientists we must always conduct our enquiries on the supposition that nature is adapted to meet our systematizing ambitions, we cannot in this case—as we can in the case of its conformity to the categories of the understanding—have any guarantee

that it will necessarily do so; if on a particular occasion it turns out to accord with our theoretical concerns, that can only be for us a contingent result. But the attainment of every objective where failure is possible is accompanied by a feeling of pleasure. Hence whenever the scientific quest after systematic unity is crowned with success, such an achievement is bound to be pleasing: the discovery, Kant notes, "that two or more empirical heterogeneous laws of nature are allied under one principle that embraces them both is the ground of a very appreciable pleasure" (ibid., p. 27). Thus it emerges that the exercise of judgment can be viewed as being intimately connected with the experience of a certain kind of pleasurable feeling, one that has its source in the satisfaction afforded to our faculties of cognition rather than in the fulfillment of any practical aims or desires we may happen to entertain.

The above concludes what Kant has to say in the Introduction about the part played by reflective judgment in rendering the scientific enterprise possible. In effect, it constitutes a prelude that leads—admittedly somewhat obliquely—to the two central sections of his *Critique,* the first comprising a comprehensive analysis of judgment in relation to the aesthetic consciousness and the second a discussion of its role that focuses chiefly on the interpretation of organic phenomena of the sort studied in biology. At first sight these might seem to represent very dissimilar fields of interest. Nevertheless, they are both ones in which Kant again treats the idea of purposiveness as occupying a pivotal position. Furthermore, the intellectually oriented conception of pleasure he associated with the use of reflective judgment in scientific contexts may be regarded as anticipating, if only in some respects, a notion that lies at the heart of his aesthetic theory.

AESTHETIC JUDGMENT AND EXPERIENCE

Kant's concern with aesthetics—the subject to which Part I of the *Critique of Judgement* is exclusively devoted—was by no means new. It is true that his appreciation of art itself was limited in both scope and depth. That was especially so in the case of music, to whose appeal he appears to have been largely insensitive; yet even with regard to literature he seems to have confined himself to a somewhat narrow diet, while his lifelong residence in the city of Königsberg meant that he had practically no direct awareness of what had been achieved in the spheres of painting, sculpture, or architecture. All the same, these constraints did not prevent him from taking a considerable interest in the nature and sources of aesthetic experience. He had long been familiar with eighteenth-century writing on

aesthetic matters, an essay he published in 1764 on the feeling of the beautiful and sublime suggesting that by that time he was already broadly acquainted with the contributions made by such British thinkers as Hutcheson, Addison, and Burke. He referred, however, to the piece in question as having been undertaken "more with the eye of an observer than a philosopher," and it was in fact only when he returned to the topic more than two decades later that he felt able to accord it the type of theoretical treatment it merited.

This was due to the circumstance that during the years immediately preceding the composition of the third *Critique* Kant underwent a fundamental change of mind concerning the character of aesthetic claims. Generally speaking, he regarded earlier theorists, who included men like Baumgarten, Lessing, and Hume, as having tended to favor one or other of two radically opposed approaches to what these involved. Either they viewed them as being essentially related to psychological reactions or sentiments which were subject to a purely empirical investigation, or else they interpreted them instead as answerable to conceptual criteria or rules in a way that implicitly assimilated them to the status of cognitive assertions about objective reality. While he had previously been inclined to sympathize with the first position, Kant was now of the opinion that neither of them was finally acceptable. Both distorted what was basically at issue, each—though in contrasting ways—failing to do justice to distinctive peculiarities of judgments of taste that rendered them problematic. He therefore concluded that it was necessary to provide a fresh analysis of their implications, one that was designed moreover to show that the possibility of such claims ultimately depended upon the satisfaction of certain *a priori* conditions. Given that he had at the same time come to regard aesthetic appreciation and the pleasure it afforded as representing a specific form in which reflective judgment manifested itself, this was not an unexpected aspiration.

Beauty and the problem of taste

Many of the elements central to Kant's revised account are set out in the section that opens this part of the *Critique* and is called "Analytic of the Beautiful." As its title indicates, he considers the judgments with which he is dealing to be propositions ascribing beauty to things, subdividing his discussion of them into four "moments"—quality, quantity, relation, and modality—which purport to elucidate their essential nature under distinguishable aspects. Although schematically separated, however, the different features thereby identified tend (some-what questionably) to be

spoken of as logically interdependent, and Kant also introduces additional points about their import that await clarification or elaboration further on in the book. Thus close attention to the order and detail of his exposition at this stage is liable to encounter obscurities or uncertainties that raise difficulties of interpretation. Nonetheless, and despite such complications, it is possible to view what he writes as contributing to a developing pattern of argument whose general tenor and purpose become evident as he proceeds.

Right at the beginning of the "Analytic" Kant makes it apparent that he wishes to draw a sharp distinction between aesthetic judgments and ones that are objectively cognitive; to that extent at least he is in agreement with previous theorists who adopted a basically subjectivist position. Judgments of taste are not concerned with, nor can their truth be determined by reference to, observable properties of phenomena in the sense in which those may be said to underlie claims to knowledge about how matters stand in the world. Rather, they crucially have to do with the manner in which particular representations affect us so as to produce a "feeling of pleasure or displeasure," the latter being something that "denotes nothing in the object." It follows, Kant thinks, that aesthetic judgments are ones whose "determining ground *cannot be other than subjective,*" and he goes on to stress the contrast between, on the one hand, apprehending a building from a strictly cognitive standpoint and, on the other, being "conscious of this representation with an accompanying sensation of delight" (Part I, pp. 41–2). *Qua* subjective feeling, such a pleasurable reaction can contribute or add nothing to our knowledge of the building considered as an independent object of perception; it is, however, indispensable as forming the basis of a favorable judgment of taste.

It appears, then, that pronouncing something to be beautiful necessarily implies finding it to occasion an experience of satisfaction. But satisfaction of what kind? Unlike some of his predecessors, who had also assigned pleasure a central place in their accounts, Kant was not content merely to regard the notion as referring to an isolable mental state, identifiable apart from the varying conditions of its occurrence. We have seen that traces of a different approach were already discernible in the Introduction to the *Critique;* but it is only here, where Kant emphasizes the need to discriminate the type of enjoyment intrinsic to the appreciation of beauty from the kinds of satisfaction experienced in other contexts, that it is explicitly formulated and developed. Thus he insists that the delight relevant to such appreciation must be carefully distinguished from pleasures which are, as he puts it, "allied to an interest" and which presuppose the presence of determinate appetites or wants on the part of the subject. Pleasures of the latter sort fall into two main groups,

respectively categorized as ones that relate to the agreeable and ones that relate to the good. So far as the agreeable is concerned, Kant singles out immediate pleasures of sense, speaking at the same time as if these involved the gratification of particular desires or inclinations. By contrast, pleasure in the good is not a matter of sensuous enjoyment, the satisfactions in question being determined instead by rational considerations of a characteristically practical nature—we may, for instance, be pleased by something's serving a certain purpose or again by its meeting certain standards or requirements we have in mind, including those prescribed by morality. Delight in the beautiful, however, stands on a completely different footing from either of the above. It derives from no specifie interest, whether sensuous or practical, that we may take in the existence of a given object or state of affairs. On the contrary, our attention in this case is directed solely to what strikes us as worthy of contemplation in its own right, the pleasure afforded being dependent neither upon sensory gratification nor upon a recognized conformity to the demands of practical rationality or volition. Hence it can be said that, of the triad of delights mentioned, taste in the beautiful constitutes "the one and only disinterested and *free* delight; for with it, no interest, whether of sense or reason, extorts approval" (Part I, p. 49). It is related to "favour," as opposed to "inclination" or "respect," and "favour is the only free liking."

The view that an attitude of disinterested contemplation is essential to aesthetic appreciation is one that has acquired widespread currency since Kant's time. He may not have been alone among eight-eenth-century philosophers in subscribing to it, but he was certainly the most explicit and influential of its original proponents. He saw it, moreover, as having a significant bearing upon a feature of judgments of taste that was vital to a proper interpretation of their meaning. For he thought that, if the delight we take in a particular object is believed to owe nothing to conditions or preoccupations peculiar to ourselves, we feel we have reason for claiming that it should elicit a similar delight from everyone. And it was just such a claim to general agreement that he held to be necessarily embodied in aesthetic appraisals, a claim which he initially encapsulated in the contention that "the beautiful is that which, apart from concepts, is represented as the object of a *universal* delight" (Part I, p. 50). The grounds and implications of this contention are examined and explored in the second and fourth "moments" of the "Analytic."

The fact that we are typically prone to speak as if beauty were a quality of things in the world is pertinent to what Kant has in mind. As one might expect, he implies that such a form of words is misleading insofar as it suggests that aesthetic judgments can legitimately be assimilated to objective judgments of a cognitive kind. Nevertheless, it is also revealing

in pointing to a genuine analogy between the two; for the former, despite being subjectively founded on feeling, resemble the latter in that they "may be presupposed to be valid for all men." This becomes apparent, Kant thinks, if one compares the ways in which we refer to the merely pleasant or agreeable, where what we say is restricted in scope to our own private sensations, with the pronouncements we make about the beautiful, these being understood to have universal import in that they lay claim to the assent of others. Appealing to ordinary usage, Kant argues that when someone says that a particular wine is agreeable he will readily admit that he is asserting no more than that it is agreeable *to him*. There is therefore no contradiction between his judgment and a divergent judgment about its agreeableness expressed by somebody else, with the consequence that neither can properly criticize or condemn the taste of the other as "incorrect": here, as in all cases of what is found personally pleasing to our various senses, the familiar dictum "Everyone has his own taste" holds good. When, on the other hand, we turn to ascriptions of beauty, the situation markedly changes. A person cannot in the same fashion confine him-or herself to saying of, for example, a building or a poem, "It is beautiful *for me,*" as if that again were just a matter of the pleasure it happened to give them. For, according to Kant,

> if it merely pleases *him,* he must not call it *beautiful*. Many things may for him possess charm or agreeableness—no one cares about that; but when he puts a thing on a pedestal and calls it beautiful, he demands the same delight from others. He judges not merely for himself, but for all men, and then speaks of beauty as if it were a property of things.
>
> (Part I, p. 52)

Such an implicit call upon the agreement of others, which Kant sharply distinguishes from a mere empirical conjecture as to how they are likely to react, explains how it is that divergent judgments of beauty, as distinct from ones concerning the agreeable, represent genuine instances of conflict. For here we express ourselves as if we were entitled to their assent; in his own words, we "formulate judgements demanding this agreement in its universality," and if it is not forthcoming we are apt to regard those who dissent as being mistaken or wrong—we do not shrug off its absence as simply a difference in individual response. To that extent, then, aesthetic appraisals may justifiably be likened to cognitive judgments about matters of fact, where a similar claim to universal acceptance is implied and where divergences of opinion give rise to imputations of error.

There, however, the apparent resemblance ends. For the validity to which aesthetic appraisals lay claim is subjective only; as such it in no way

depends upon the use of concepts, whereas these play an essential role in ascribing validity to cognitive judgments about items in the world. Judgments of the latter type, in addition to presupposing the formal conditions imposed by the categories, necessarily involve subsuming what is perceptually presented under determinate empirical concepts whose applicability to the given is governed by publicly recognized rules. The validity of a particular cognitive claim is thus objectively decidable according to whether what it purports to denote and describe has been correctly characterized in a manner that conforms to the relevant rules or criteria. But it is Kant's emphatic contention that judgments of taste cannot be understood or assessed in these terms: "in forming an estimate of objects merely from concepts, all representation of beauty goes by the board," appeals to specific rules or principles as a means of compelling agreement or resolving disputes in aesthetic contexts being out of place (Part I, p. 56). If that were not so, aesthetic judgments would—as certain theorists have earnestly hoped—be "capable of being enforced by proofs." Yet their hopes are vain, disregarding as they do something that is intrinsic to the very notion of aesthetic appraisal and failing which nothing can rightfully qualify as a judgment of the kind in question. For, as Kant has already insisted, what is crucial in grounding such a judgment about a given object is the pleasure we subjectively experience when we contemplate it; we must "get a look at the object with our own eyes, just as if our delight depended on sensation." If the requisite delight is lacking we cannot properly or sincerely pronounce the thing to be beautiful, nor *a fortiori* can agreement that it is be wrung from us by others, however numerous they may be and whatever supposed "rules of beauty" laid down by distinguished critics they may invoke in their support. As he puts it elsewhere, in such circumstances I can only "take my stand on the ground that my judgement is to be one of taste, and not one of understanding or reason" (ibid., p. 140). The contrast with the claims to validity implicit in cognitive assertions could not, it would appear, be more trenchantly affirmed.

Nevertheless, and as Kant himself was well aware, the position he had reached raised a considerable problem from a philosophical point of view. If aesthetic appraisals differed from expressions of personal liking in claiming universal and—as he further maintained—necessary agreement, and if they differed from cognitive judgments in virtue of their essentially subjective orientation, the question inevitably arose as to whether, and if so in what manner, they could be said to be justifiable. It was one thing to offer an analysis that aimed to exhibit their logical and epistemological peculiarities. It was another to contend that, given such features, we were actually entitled to make them. In our ordinary practice we might speak as if we were, but with what right? When I say of an object that it is of a

certain shape or dimensions, there are determinate criteria to which reference can be made; granted that its empirically identifiable properties satisfy them, I may legitimately require general assent. When, on the other hand, I call it beautiful, it is intersubjective agreement in response, not agreement in objective description, that is centrally at issue. And here, it seems, I have ultimately to consult and rely upon my own felt reactions to the thing, "to the exclusion of rules and precepts" and without the availability of empirical or conceptual proofs. But if so, what valid grounds can I or anyone else possess for purporting to speak with a "universal voice" that lays claim to the concurrence of all? In Kant's own summary formulation of the problem, "how are judgements of taste possible?" (Part I, pp. 144–5).

An early intimation of his approach to the question he posed had already appeared when he was discussing the disinterestedness of aesthetic pleasure and when he there implied that the absence of personal idiosyncrasies in determining our delight might naturally lead us to regard it as resting on what we "may also presuppose in every other person." As originally introduced, however, this seems to be presented as a mere conjecture which is uninformative as to the content of the presupposition referred to and which in any case stands in need of independent substantiation. And much of what Kant wrote in subsequent sections may be interpreted as being designed to provide such substantiation. Thus he went on to argue that a careful examination of the inner nature and sources of our pleasure in the beautiful showed it to be due to the satisfaction of subjective conditions of judgment which must indeed be assumed to be universally present in every human being. Hence if we could be sure that the pleasure we experienced was produced in accordance with these conditions, we should in fact be entitled to call upon the agreement of others in the manner distinctive of judgments of taste. Although his reasoning in support of this conclusion takes an intricate and on occasions bewilderingly circuitous course, the salient points covered are not hard to discern.

What, then, are the "subjective conditions" to which allusion has been made? Kant's answer derives from his faculty psychology and turns on something he calls "the free play of the cognitive powers." In the account of perceptual knowledge originally given in the *Critique of Pure Reason* and briefly recalled in the present work, such cognition was portrayed as involving the operations of both imagination and understanding. The imagination, as "the faculty of intuitions or representations," holds together and synthesizes items of the sensory manifold so as to allow them to be subsumed by the understanding under appropriate concepts; in this connection, therefore, it can be said to be at the service of the understanding, "in harness" to the latter in its task of categorizing and

conceptualizing the presentations of sense. Now it is Kant's contention that the same two faculties are also operat-ive at the level of aesthetic experience. Here, however, there can be no question of there being a specifie cognitive purpose which requires the subordination of the imagination to the ends of the understanding; in consequence, the roles they respectively perform do not conform to this pattern. Instead they should be regarded as engaging or meshing together in a fashion that enlivens or "quickens" both while setting "irksome" constraints upon neither: in the ideal case, that takes the form of a harmonious accord, a mutually satisfying interaction whereby each faculty is proportionately attuned to the other in an unconstrained "entertainment of the mental powers." The resultant "feeling of free play" is one of pleasure, and it is of such pleasure that we are conscious when our experience is of an authentically aesthetic kind.

Kant believed that the above account provided the basis for a "deduction," or justification, of the intersubjective validity to which judgments of taste laid claim. For with those the delight involved was not dependent upon merely contingent capacities for sensuous enjoyment which notoriously varied from individual to individual. On the contrary, it had been shown to presuppose the operation of intellectual faculties that must be presumed to be identical in all human beings as *a priori* conditions if communicable knowledge was to be possible; hence it was pleasure of a type which everybody, in appropriate circumstances and undistracted by irrelevant considerations, could rightfully be expected to share. Kant indicated, moreover, that the position he had advanced had an additional consequence to which he attached great importance, a consequence that concerned the aspects under which an object must strike us if it was to produce the requisite response. In explaining what this consisted in, he introduced the notion of "formal finality" or "purposiveness without a purpose" *(Zweckmässigkeit ohne Zweck)*.

How are these curious expressions to be understood? At first sight Kant might be taken to mean that, in ascribing beauty to products of nature, we are subjectively disposed to think of them as somehow purposively adapted to our faculties but without being thereby justified in asserting this to be actually the case. And that is suggestive of a partial analogy with what he wrote in the Introduction about the conception of nature presupposed by reflective judgment in relation to scientific enquiry. But while in contexts involving natural beauty he is apt to speak in this vein, he also makes it clear that he has something further in mind. For he also argues that for pleasure of the relevant kind to be possible our response must be occasioned by the perceptual *form* an object displays, this form being experienced as manifesting a self-subsistent coherence or order which is apprehended neither as serving an assignable objective end or

utilitarian purpose nor as conforming to some prior notion of what the thing is supposed or intended to be. The point is elaborated in a celebrated distinction drawn between what he respectively calls "pure" or "free" beauty and "dependent" or "adherent" beauty: the first, he writes, "presupposes no concept of what the object should be; the second does presuppose such a concept and, with it, an answering perfection of the object" (Part I, p. 72). Thus if we appreciate a natural product in terms of its suitability to its biological function or a human product in terms of its meeting requirements specific to objects of that type, we are assessing it from the standpoint of dependent beauty and any pleasure we derive there-from partakes of what Kant earlier referred to as being pleasure in the good. In judging something as an instance of free beauty, on the other hand, we are concerned solely with what "pleases by its form," the form in question presenting an appearance of design or purposive organization that is satisfying on its own account and without any reference to identifiable objective ends or preassigned specifications. The latter would introduce considerations of a conceptual or cognitive character, whereas it is essential to formal relationships of the sort proper to a "pure" judgment of taste that they should not be reducible to some "universally applicable formula" and that they should be grasped and enjoyed in a way that is altogether free from the constraint of determinate rules.

In giving examples of objects that impress us with the requisite pleasingness of form, Kant selects as "beauties of nature" certain birds, flowers, and crustaceans; in general, indeed, it is to natural products that he tends to accord precedence throughout this part of his text. But he also illustrates what he has in view by mentioning various human artifacts. Thus abstract "designs à la grecque" and wallpaper patterns are said to be "free beauties" inasmuch as they have "no intrinsic meaning" or representative function—"they represent nothing—no object under a definite concept"; and he further asserts that art forms such as painting and sculpture, where "the *design* is what is essential," and musical works, where "composition" has an analogous status, are likewise capable of disposing the mind to the harmonious interplay of the faculties that is productive of aesthetic satisfaction. Whether his emphasis on exclusively formal features followed from, or was even wholly consistent with, his overall account of the character and grounds of judgments of taste may be questioned. It cannot, however, be denied that his asseverations on that particular score have frequently been seen as anticipating certain substantive critical doctrines which were to achieve considerable prominence more than a hundred years after he wrote. The conception of visual art as pre-eminently a matter of "significant form," popularized early in the twentieth century by British writers like Roger Fry and Clive Bell, has often been cited in this connection. It is noteworthy, too, that the

American critic and advocate of formalism, Clement Greenberg, later explicitly referred to him as a precursor of modernist theory. Such comparisons and parallels are understandable enough if viewed in the context of some of the claims Kant put forward in the "Analytic of the Beautiful." Nevertheless, they accord less comfortably with what he had to say when, in the second of the two main sections into which Part I of the *Critique of Judgement* is divided, he effectively widened the scope of his investigation of aesthetic experience.

The sublime and fine an

Both the title of this lengthy second section and the manner of its organization have—not surprisingly—troubled commentators. Kant called it "Analytic of the Sublime," thereby giving the impression that he would be centrally concerned with sublimity considered as a distinguishable dimension of the aesthetic consciousness. But the heading chosen turns out to be misleadingly restrictive. Not only does the implied contrast with beauty lead him back into picking up and elaborating on matters regarding the status and justification of judgments of taste that had already been alluded to in the preceding section. He also goes on to undertake an extended examination of the nature and value of artistic achievement which reaches far beyond anything suggested by his previous, rather cursory remarks on that topic. And while it is possible to descry some connection between the treatment of art he is now concerned to provide and his treatment of the sublime, the links discernible remain at best tenuous. Following the order of Kant's own account, we shall begin with the latter.

Kant's interest in sublimity as a distinctive aesthetic category dates back to his 1764 essay on its relation to beauty which was mentioned earlier on. As in the case of the beautiful, however, his approach to the sublime underwent a profound transformation, the setting in which his observations were originally framed being replaced by one that eschewed "merely empirical" considerations of the kind adduced by Edmund Burke in his famous study of the subject in favor of a "transcendental exposition" that involved conceptions deriving from Kant's mature critical system. In giving such an exposition, he makes it clear that he does not wish to deny the presence of significant similarities in our appreciation of the two. Thus he claims at the outset that both are "pleasing on their own account" and without reference to any further end. Moreover, judgments of the sublime are like pure judgments of beauty in not presupposing the application of any determinate concept and in the fact that, while being

singular and noncognitive, they nonetheless lay claim to universal validity. Yet, despite these affinities, there are important differences which Kant is at pains to point out. In his eyes, they are sufficiently impressive to make an independent explanation of how sublimity can figure as a recognizable aspect of our aesthetic experience seem an imperative requirement.

The need for such an explanation becomes plain when we compare the satisfaction we take in the beautiful with that aroused by the sublime. As has been seen, the former is held to involve the apprehension of a formal or self-subsistent purposiveness in objects which engages our faculties of imagination and understanding in harmonious free play. Furthermore, so far as natural beauty is concerned we are elevated by the thought of nature as being in some sense ideologically ordered to elicit this pleasurable response, "a finality in its form making the object appear, as it were, preadapted to our power of judgement" (Part I, p. 91). In the case of the sublime, however, nature confronts us in quite another light. For what is striking here is the circumstance that we assign sublimity to natural effects which present themselves to us as limitlessly vast or chaotic in a way that may be totally devoid of form. And this is connected by Kant with additional points of difference. Whereas what we find beautiful in nature is experienced as being happily attuned to our mental faculties, natural products of the kind typically referred to as sublime are said to "contravene the ends of our power of judgement"; they overwhelm our capacity for sensuously taking them in, thereby constituting what he calls an "outrage on the imagination" rather than anything conducive to its unconstrained accord with the understanding. It follows (Kant thinks) that sublimity, unlike beauty, is incorrectly ascribed to the phenomena themselves; for how can what is apprehended as "inherently contra-final" be noted with an expression of approval? Instead, we should properly attribute it to the sentiments and attitudes of mind they evoke in us, these being essentially associated with the presence of rational ideas that exceed the bounds of sensory presentation. As he himself puts it: "the sublime, in the strict sense of the word, cannot be contained in any sensuous form, but rather concerns ideas of reason" (ibid., p. 92).

Kant's stipulations concerning the use of the term, and the accompanying contrast drawn with beauty, consort somewhat oddly with what he says elsewhere about the grounds and subjective orientation of aesthetic judgments in general. Given that—as he here allows—objects can properly be called beautiful in virtue of their aptitude for affecting our faculties in certain ways, why should not the same considerations apply to the phenomena we call sublime, even if these are said to affect them in a radically dissimilar manner? In fact, it is his reference to reason and its ideas that is crucial in the present context and that chiefly underlies the distinction he wishes to make. For, insofar as particular natural

phenomena cause us to entertain conceptions that outrun our powers of imaginative representation, they arouse us to a consciousness of reason as an independent faculty which leads us "to esteem as small in comparison with [its] ideas…everything which for us is great in nature as an object of sense." And that, Kant claims, helps to explain the pleasurable exaltation induced by the sublime, springing as it does from a presentiment of "our superiority over nature" that awakens us to our rational vocation and makes the mind "sensible of the sublimity of the sphere of its own being." Accurately construed, therefore, sublimity "does not reside in any of the things of nature, but only in our own mind" (Part I, p. 114).

The invocation of reason as a separate "supersensible" faculty, which according to his previous *Critiques* is capable of both a theoretical and a practical exercise, underpins the account Kant goes on to give of two different modes wherein the above presentiment is held to manifest itself and which he refers to respectively as the "mathematically" and the "dynamically" sublime. In the case of the first, it is the sheer magnitude and formlessness of what appears before us that is paramount, conveying a perceptually intractable impression of unlimited extent and absence of boundary. But the failure of the imagination to encompass within a comprehensive intuition what is thus intimated to it, and the consequent dissatisfaction we feel in the face of its inadequacy, is counterbalanced by the fact that we are able to grasp in *thought* the notion of the infinite as a totality or "absolute whole," the latter being an indeterminate idea ascribable to reason in its theoretical capacity. Hence the very limitations displayed by the imagination in its fruitless endeavors to measure up to this idea at the level of sensuous representation serve to highlight by contrast the supremacy of our rational powers, indicating that we are endowed with "a faculty of mind transcending every standard of sense" (Part I, p. 102). A broadly analogous conclusion is reached in Kant's discussion of the dynamically sublime, although here the focus is on reason in its practical employment and what he writes assumes a distinctively ethical character. Whereas in the preceding case it was the vast dimensions of certain phenomena that impressed us, it is now the apparently "irresistible might" exhibited by such natural occurrences as violent storms and volcanic eruptions. Like Burke before him, Kant insists that the aesthetic appreciation of nature under this threatening aspect, which brings home "a recognition of our physical helplessness," is only possible when we view it from a position of safety; on the other hand, he fundamentally diverges from his predecessor in the interpretation he offers of the satisfaction involved. That is not (as Burke had implied) due to the moderation of our sentiments which the absence of personal danger produces and which thereby allows us to find pleasantly invigorating and stimulating what would otherwise be experienced as disagreeably

frightening. On the contrary, Kant holds its actual source to lie once again in a sense of the superiority of our rational powers to those of sensibility. This time, however, it is not a theoretical capacity to surpass in thought the limits of the sensuously oriented imagination that he has in mind. Rather, it is a supposed ability at the level of our practical life to respond to hostile or menacing circumstances in such a manner as to withstand the pressures of sensuous inclination. The dynamically sublime, in other words, awakens us to the conception of ourselves as self-determining moral agents who can rise above the solicitations of sensuous impulse and make our conduct conform instead to the principles and ends laid down by practical reason. Thus in experiencing it we are conscious of being more than mere creatures of sensibility—here conceived as a susceptibility to natural desires or fears—and are raised to a presentiment of the pre-eminence of our rational stature. This, moreover, is something we may properly expect of all human beings in virtue of their assumed capacity for moral feeling. It follows, therefore, that judgments of the sublime, like judgments of the beautiful, may rightfully command general assent, although they do so on different grounds.

The emphasis on pride in the supremacy of reason in Kant's theory of the sublime, together with the prominent place he assigned to moral considerations, may not be felt to conform very happily to our intuitive understanding of the concept as applied in aesthetic contexts. In tackling the problems it poses, however, he at least showed a novel insight into their complexity, as well as demonstrating a salutary readiness to extend the range of his enquiry beyond the somewhat narrow limits suggested by his initial analysis of taste. And a similar sensitivity to the variety of forms that aesthetic experience can take emerges in the passages he specifically devoted to the importance and value of art. In his earlier treatment of beauty he had tended to accord paradigmatic status to natural objects, with the accompanying implication that the aesthetic quality of works of art was estimable in comparable terms. Here, by contrast, it is the distinguishing features of the latter that he goes out of his way to stress.

One such feature concerns intentionality. Kant does not retract his original claim that to be beautiful natural objects must convey an impression of formal design, even appearing to us as if they had been "chosen as it were with an eye to our taste" (Part I, p. 217). But that is very different from appreciating something in the knowledge that it is the product of *actual* deliberation, consciously made with a view to affecting us in a manner that will be found satisfying in its own right. Artistic works are intentional in this full-blooded sense and realizing them to be so is vital to their appraisal—"a product of fine art must be recognized to be art and not nature." That is not to suggest that they should look artificially contrived or "laboured"; rather, they must be "clothed *with the*

aspect of nature" in not seeming to owe their creation to an obtrusive observance of constrictive or "mechanical" rules. Thus an unstudied "pleasingness of form," consonant with the conditions of taste, remains a necessary component of artistic worth. But it is not—Kant now insists—sufficient. Acknowledgment of the intentional dimension of art requires us to take account of a further factor, one that relates to the content of a work or to what it is meant to represent.

Reference to the relevance of representational considerations in evaluating artistic achievement certainly constitutes a significant departure from the restrictively formalist preoccupations evident in some of Kant's previous pronouncements on the subject. Yet it would be wrong to conclude from what he writes about artistic representation that he simply had in mind the mimetic reproduction of natural phenomena in another medium, however elegantly or harmoniously that might be accomplished. For his discussion of it is integrally connected with the role he ascribed to "genius" in art, this being described as completely opposed to the "spirit of imitation" and as involving capacities additional to merely technical skills that can be picked up and learned through academic training. Genius, according to Kant, is an esentially original and creative power, exhibiting itself among other things in the portrayal and expression of what he termed "aesthetic ideas": taste may impart a universally pleasing appearance to art, but it is genius, as the source of and ability to communicate such ideas, that animates genuine examples of fine art with "soul" or "spirit." Thus questions concerning the nature of aesthetic ideas and the manner in which they can be presented by artists in a publicly accessible form assume a critical importance in his account. How should what he says about them be interpreted?

In looking for an answer, it is worth noting some remarks Kant makes about their relation to ones of the kind that figured in his theory of the sublime. Ideas like those of absolute totality or transcendental freedom were "indemonstrable concepts of reason" to which nothing could objectively correspond at the level of possible experience and for which a "commensurate intuition" could therefore never be given. Aesthetic ideas, it is now suggested, may be appropriately viewed as constituting the counterpart of such purely rational conceptions. They resemble the latter in not belonging to the sphere of objective cognition, but they do so for a diametrically opposite reason. For what are here under consideration are representations or intuitions of the imagination "for which an adequate concept can never be found." Kant elaborates on the point as follows:

> By an aesthetic idea I mean that representation of the imagination which induces much thought, yet without the possibility of any

> definite thought whatever, i.e. *concept,* being adequate to it, and which language, consequently, can never get quite on level terms with or render completely intelligible.
>
> (Part I, pp. 175–6)

It appears, then, that insofar as works of art are understood to embody aesthetic ideas, their inner content can never be finally or exhaustively articulated in alternative terms. The multiplicity of thoughts and associations conveyed by such works overflows the boundaries of determinate formulation and definition, outrunning the resources of conceptual or linguistic expression.

Kant develops and illustrates this theme in subsequent passages. He does not dispute that, in seeking to give sensuous shape to the ideas that inspire them, artists are obliged to draw upon material which is furnished by perception and which is itself susceptible to objective description. He stresses, however, that they do not do this in a merely imitative spirit, but rather in a fashion that imbues familiar phenomena with an unfamiliar meaning or symbolic resonance, thereby "animating the mind by opening out for it a prospect of kindred representations stretching beyond its ken." Far from simply copying nature, art "surpasses" it, seizing upon the elusive intimations and fragmentary aspects of ordinary life and experience and "bodying them forth to sense with a completeness of which nature affords no parallel." Thus imagination, regarded in the context of artistic activity as a productive rather than a reproductive capacity, can be affirmed to be "a powerful agent for creating, as it were, a second nature out of the material supplied to it by actual nature" (Part I, p. 176): it does not so much mirror the everyday world as transform it. It must be admitted that Kant's allusions to the imaginative faculty are at times confusing, and not least in the apparently very different status accorded to it here from the one he typically assigned to it in his treatment of the sublime—he is even prepared to speak of it in its artistic employment as "emulating the display of reason in its attainment of a maximum." But notwithstanding such difficulties and obscurities, his suggestive account of the imaginative potential of aesthetic ideas may be seen in retrospect to have been at once arresting and seminal. In emphasizing the revelatory though conceptually "inexponible" nature of specifically artistic representation, he anticipated in outline approaches followed by both Schiller and Hegel, particularly the latter's detailed portrayal of the various arts as modes of expression in which thought and sensuousness are to be found indissolubly united or fused.

The aesthetic and the ethical

It was indeed Hegel who, referring to Kant's aesthetic theory as a whole, described him as having spoken "the first rational word" on the subject. Whatever Hegel himself may have meant by this, there can be no question that Kant's overall contribution proved to be of cardinal importance for the future development of aesthetics as a separate branch of philosophy. Rich in content and comprehensive in scope, it stands out as a historical landmark in the field, bringing into view considerations whose deeper significance had eluded the notice of earlier writers and whose ramifications have continued to haunt later ones. Furthermore, by underlining though not finally resolving problems unique to judgments of taste, it did much to encourage the notion that the aesthetic consciousness forms an autonomous or self-contained sphere, irreducible to other areas of human experience and demanding independent investigation in its own right.

Yet while Kant's influence in promoting such an outlook seems incontrovertible, a certain qualification regarding his own position is in order. It may be true that he never diverged from his fundamental claim that aesthetic judgments can no more be assimilated to practical or moral judgments than they can be to those of cognition or mere sensory liking. However, that did not prevent him from suggesting in a variety of places and contexts that connections exist between our capacities for aesthetic appreciation and broader concerns relating to our lives and conduct. This was clearly evident in his analysis of the dynamically sublime, with its pronounced ethical overtones. But discernible variations on the same general theme occur elsewhere. At one point, for example, he contends that the cultivation of taste and the communication of the delights it affords play a noteworthy role in social development, exerting a civilizing impact upon human behavior and intercourse. And at others he draws attention to analogies between the aesthetic and the moral points of view: in both cases we can be said to prescind from a preoccupation with personal gratification or advantage, regarding things instead from a universally shareable perspective; insofar as taste is conducive to such a mental state, it makes "the transition from the charm of sense to habitual moral interest possible without too violent a leap" (Part I, p. 225). Finally, Kant indicates that a concern with the beauty of nature—though not, it transpires, with that of art—is linked in a special way to our aspirations as moral beings. His point seems to turn on the often reiterated idea that natural beauties strike us as if they were designed to accord with and satisfy our mental powers in the enjoyment of aesthetic experience, intimations of such an apparent harmony between mind and nature being said to awaken an "interest…akin to the moral" (ibid., p. 160). What he

writes on this score is admittedly condensed and somewhat elusive, but he can partly be taken to mean that the interest in question derives from the notion of nature's being capable of displaying a comparable accordance with our ethical ideals and ends. If so, the moral significance he wishes to attach to the appreciation of natural beauty differs markedly from—though without necessarily conflicting with—the moral import he attributed to our experience of the dynamically sublime. For the latter was essentially related to our assumed ability as self-determining rational agents to rise above the promptings of natural inclination at the level of inward choice and intention. Here, on the other hand, it is the conception of nature's ultimately harmonizing with the fulfillment of ethical ideas and projects at the level of external reality that is relevant. And that may recall what Kant wrote about the faculty of judgment in general when, at the start of the third *Critique,* he contemplated its playing a mediating role in relating our moral aspirations to the world. Nor need this seeming echo of his wider preoccupations surprise us. Although at times only faintly in evidence, they were seldom—if ever—altogether absent from his mind.

TELEOLOGICAL JUDGMENT AND EXPLANATION

In Part II of the *Critique of Judgement* Kant takes leave of aesthetics and returns to topics in the philosophy of science, the notion of purposiveness as "the characteristic concept of the reflective judgement" once again being prominent in what he has to say. Even so, he is at pains to point out that the issues that now occupy him must be distinguished from those he was dealing with when considering the fundamental presuppositions of scientific enquiry in the Introduction. Thus it was one thing to ascribe purposiveness to nature in the sense of conceiving the natural sphere to conform to a "logical system" of empirical laws which was adapted to our cognitive capacities and powers of comprehension. It was another to postulate or assume the applicability of purposive conceptions to particular types of *objects* falling within the natural realm. And it is to the specific question of whether, and if so in what manner, it may be justifiable to interpret from a scientific standpoint certain phenomena in purposive or ideological terms that the present part of the *Critique* is to a large extent directed. As quickly emerges, the particular phenomena Kant has in view are living or organic beings of the sort studied in biology.

Internal purposiveness and the concept of an organism

Generally speaking, and given the preconceptions of the age in which Kant was writing, the belief that organic phenomena presented special problems for the development of science is not hard to understand. The adoption of mechanical principles of explanation, founded upon the notion of "matter in motion" and according to which natural objects and events were universally subject to quantitatively determinable causal regularities, appeared acceptable enough when applied to the inanimate domain; by the close of the eighteenth century, indeed, the Newtonian framework of material particles and forces seemed already to have been triumphantly vindicated through the formulation of experimentally confirmed hypotheses whose explanatory power extended over a very wide range. When, however, it was proposed that the same approach should be transferred to the sphere of the organic the position looked a good deal less straightforward. For living things possessed features that apparently distinguished them sharply from inanimate entities and substances. In particular, they exhibited a degree of internal organization and complexity which made it difficult to regard them as the merely contingent products of "blind" causal forces or mechanisms and which suggested instead that it would be more apposite to invoke notions like design and purposive function in accounting for their structure. Thus a division tended to open up between those who steadfastly maintained that in the final analysis all phenomena, animate and inanimate alike, were explicable in mechanistic terms and those who claimed that the phenomena of organic life required for their proper interpretation a quite different set of ideas.

The broad outlines of this emerging controversy were already clearly visible in Kant's time. Teleological conceptions might have been effectively extruded from the sphere of physics, but the belief that they were nonetheless requisite in some form for the understanding of living things found adherents in contemporary biology. Moreover, quasi-Aristotelian ways of thinking about nature had been revived at a more general level by the philosopher J.G.Herder whose principal work, *Ideas toward a Philosophy of the History of Mankind,* was severely criticized by Kant himself on its publication in 1784. That such views impinged crucially upon his own position will be evident from what has already been said about the epistemological theses he had advanced in his first *Critique*. For according to these the very possibility of objective experience and knowledge was dependent upon the application of *a priori* concepts and rules in unifying the data of sense, the latter being held to correspond in essentials to the basic principles of Newtonian science. It appeared to follow, therefore, that nature was universally subject to regularities that

conformed to the accepted paradigm of scientific explanation: in Kant's words, "appearances must… be capable of complete causal explanation in terms of other appearances in accordance with natural laws" (*Critique of Pure Reason,* B 574). Claims of this sort, suggestive of an unqualified commitment to the tenets of the Newtonian scheme, might thus lead one to suppose that he would have ranged himself firmly with those who argued that organisms, no less than the rest of the natural world, were susceptible to mechanistic modes of explanation, and that he would have set his face against any attempt to reintroduce—even within a limited field of enquiry—conceptions that apparently harked back to an earlier epoch of scientific thinking. In fact, however, he followed another route; the opinions on the subject he eventually arrived at were altogether more complex, with reflective judgment being invoked to resolve the matters in dispute.

At a preliminary stage of his approach to what he calls "objective finality in nature," Kant distinguishes between the notions of "external" and "internal" purposiveness. With reference to the first of these, he points out that various natural products may be regarded as being designed either for our own benefit or else for the use and advantage of other living creatures. For example, grass may be said to exist in order to support herbivores like sheep or cattle, and the existence of the latter may in turn be viewed as answering to the needs of human beings. But although we may be led to look at things in this light if we make certain further assumptions, we are in no sense bound to do so. Taken simply by themselves, we can causally account for and sufficiently explain such externally adaptive relationships without recourse to any teleological ideas.

By contrast, understanding the internal structure and development of organic phenomena seems positively to demand their employment. Thus we find it not merely natural but necessary to treat a living object like a plant or an animal as being something of which "every part is thought as *owing* its presence to the *agency* of all the remaining parts, and also as existing *for the sake of the others* and of the whole, that is as an instrument" (Part II, p. 21). So conceived, an organism can be termed a "natural end" *(Naturzweck),* an entity whose inner constitution appears to be governed by an idea of what it is meant to be or become and whose component elements variously contribute to this purpose in a fashion suggestive of the operations of a constructive intelligence; indeed, the very notion of living things as "organized beings" may be felt to carry this implication. Moreover, in the case of internal as opposed to external purposiveness, Kant insists that objects which exemplify it are such that we are unable to imagine how their nature and production could be accounted for in terms of "mechanical principles" alone. It is impossible

for human reason to hope to understand the generation of even "a blade of grass" from merely mechanical causes: "such insight," he roundly declares, "we must absolutely deny to mankind" (ibid., p. 54).

Pronouncements of the above kind strongly suggest that it is primarily to teleological modes of thought rather than to ones presupposing the operations of physical causality that we should look when investigating organic phenomena—a proposal encapsulated in Kant's dictum that an organism is a natural product in which "nothing is in vain, without an end, or to be ascribed to a blind mechanism of nature" (Part II, p. 25). Hence we may gain the impression that he was prepared after all, and despite expectations to the contrary, to side with the antimechanist camp in biology. And on the face of it this would seem to entail his accepting a dualism regarding our understanding of the empirical world which was hard, if not impossible, to reconcile with his own stated epistemological commitments. It turns out, however, that he only subscribed to it in a form that imposed important restrictions upon both the significance and the actual implications of the teleological principles involved.

Teleology and empirical science

In the first place, Kant was concerned to emphasize that similarities discernible between natural organisms and purposively constructed human artifacts must not be allowed to obscure no less striking differences. An artificial contrivance such as a watch fulfills its function because the parts of which it is composed interact by moving one another in ways that have been independently determined by its maker. Living phenomena, by contrast, are apprehended as "self-organizing" entities, endowed with a "formative power" *(bildende Kraft)* which remains for us basically mysterious in its workings and for which no close analogue exists among the products of human art or technique. The various components of an organism are interrelated in a distinctively intimate and reciprocal manner, both "producing" and "sustaining" one another: for example, if an essential part of a tree is damaged or destroyed, the deficiency is apt to be repaired or made good "by the aid of the rest" so as to preserve the life of the whole to which they severally belong. Thus in considering the role of the concepts of design and purpose in biology it is necessary to recognize the constraints that govern their meaningful use in that context.

Second, Kant indicates that in any event teleological principles of the sort employed in the interpretation of biological processes ultimately possess no more than a regulative status. In this view, to be sure, they are indispensable to our thought about these, affording modes of

understanding and suggesting fruitful lines of enquiry at a point where the resources of explanation in terms of efficient causality seem to fail us. And that, indeed, may also encourage us to enlarge the field of their application to nature as a whole, adopting a perspective on reality wherein it is assumed that "everything in the world is good for something or other; nothing in it is in vain" (Part II, p. 28). In conformity with the reservations he has already expressed about attributions of "external" purposiveness, however, Kant is careful not to ascribe to such an extended employment of teleological conceptions the indispensability he thinks these have for us within the more limited sphere of organic phenomena; we are not obliged to contemplate nature in general in this way. Nevertheless he holds that, even in the case of the organic sphere, to say that we find it subjectively necessary to bring purposive notions to its interpretation is not to say that these can be accredited with objective validity. It is one thing to assert that we are intellectually so constituted that we cannot render organic phenomena intelligible to ourselves other than by treating them *as if* they were—in some admittedly mysterious sense—designed or organized to accord with a preconceived idea or intention regarding their final form. It is another to assert this to be so as a matter of objective fact, their possibility being dependent upon the agency of a nonhuman intelligence or creative mind. The latter, according to Kant, is something we could never justify or prove: strictly speaking, "we do not *observe* the ends in nature as designed" but "only read this conception into the facts as a guide to judgement in its reflection upon the products of nature" (ibid., p. 53). Here as elsewhere, in other words, we occupy the standpoint of reflective judgment, operating with heuristic concepts and principles that play a vital role in directing our thought about nature but without being in a position to affirm the actual existence of a supernatural designer or "author of the world."

In effect, and whatever concessions he may have made to the opponents of mechanism in biology, Kant did not abandon the conviction that explanation of a cognitively acceptable kind must conform to the mechanical paradigm. It is noteworthy, for instance, that he consistently speaks of our "estimating" *(beurteilen)* organic processes through teleological conceptions, not of our explaining them thereby. Moreover, he reiterates the point that we should always press the search for mechanical causes as far as we can, since if we do not follow this procedure there can be "no knowledge of nature in the true sense at all." And while he undoubtedly asserts, quite categorically, that we can never hope to arrive at purely physical explanations of organic phenomena, he stresses that it would even so be "presumptuous" dogmatically to conclude that some "mechanism of nature," sufficient to account for them, does not in fact exist. That is something which we have simply no means of knowing; the

most that can reasonably be affirmed is that such a possibility lies beyond the limits of human comprehension.

Despite its considerable ingenuity, Kant's attempt to do justice to the rival claims of mechanism and teleology is not free from difficulty. It is true that at one point he writes as if the "antinomy" to which these approaches may be said to give rise can be surmounted by understanding each of them to be endorsing a particular methodological "maxim" for the investigation of nature rather than a principle purportively constitutive of its objective character. Thus a rule enjoining us invariably to seek causal explanations as far as we are able is not inconsistent with a rule legitimizing a resort to purposive interpretations when "a proper occasion" presents itself: to that extent the two standpoints can be reconciled. One trouble with this proposal, however, is that the causal principle was originally portrayed by Kant *as* being constitutive; to treat it now as having no more than the regulative status he has ascribed to its teleological counterpart would represent an apparent departure from that position. Furthermore, it is one thing to assert of certain phenomena, which at a given stage of enquiry seem to resist physical or mechanical explanation, that they may be accounted for instead along teleological lines. It is a different and more questionable matter to say of them that a complete causal explanation must forever be beyond our reach; indeed, the subsequent history of the biological sciences makes such a contention look somewhat bizarre. Even so, Kant certainly implied that, insofar as we found ourselves obliged to understand the functional structure of organisms in purposive terms, it was impossible for us to regard them as the mere products of what he himself called "blind efficient causes"; nor was he alone among his contemporaries in feeling that the two conceptions *prima facie* excluded one another in their application. Consequently, and notwithstanding the qualifications he introduced, he appears to have been committed to holding that we were precluded from fully assimilating organic phenomena to the framework within which all objective knowledge and genuinely scientific explanation are set. And it was perhaps partly a recognition of the problems this ostensibly presents that led him to entertain the notion of a possible understanding, "higher than the human," which would comprehend the mechanical and teleological principles as cohering within a single uniting principle that transcended them: "if this were not so," he writes, "they could not both enter consistently into the same survey of nature" (Part II, p. 70). He argues, however, that such a principle can only be referred to what, as the supersensible or noumenal ground of the phenomenal realm, lies outside the range of empirical representation. Thus so far as we ourselves are concerned it must be one of which, from a theoretical point of view, we are unable to form "the slightest positive determinate conception."

TELEOLOGY, MORALITY, AND GOD

Kant's contention that the supersensible constitutes a realm necessarily inaccessible to human knowledge and understanding of a theoretical kind is one that recurs in the Appendix which forms the long concluding section of the *Critique of Judgement*. This comprises a careful and wide-ranging discussion of the conceivable relevance of teleological interpretations of the natural world to the claims of theology. It is true that the question of whether the apparent evidence of purposiveness in nature could be invoked in support of such claims had already been broached in the *Critique of Pure Reason*, where it was examined along with other attempts that had classically been made to establish the existence and character of God from a speculative standpoint. Kant clearly felt, however, that the comprehensive investigation he had now undertaken of the general status and limitations of teleological judgment in relation to natural science warranted his embarking upon a more extended analysis than hitherto of the issues which the so-called "argument from design" involved. Furthermore, such an analysis seemed especially called for in the light of what he had written in his second *Critique* concerning the possibility of justifying belief in God from a moral or practical point of view as opposed to a theoretical one.

As has been seen, Kant specifically denied the legitimacy of deriving theological conclusions from the fact that we find ourselves subjectively obliged to interpret certain natural products in teleological terms. It may be that the best sense we can make of such apparently purposive phenomena as organisms is by thinking of them as the creations of "a supreme intelligence"; he implies, indeed, that this is the case. But at the same time he reiterates the point that such an hypothesis is devoid of objective authority and that its import must instead be comprehended heuristically; it can never do more than

> point to this cause in the interests of the reflective judgement engaged in surveying nature, its purpose being to guide our estimate of the things in the world by means of the idea of such a ground, as a regulative principle, in a manner adapted to our human understanding.
>
> (Part II, pp. 75–6)

The latter claim certainly accords with his critical objections to any theoretical attempt to transcend the limits of possible experience. Yet he thinks that, even if his strictures on that score were disregarded, other important difficulties would remain. By no means all natural phenomena

impress us as bearing the marks of design; nor is it true that everything that occurs in the empirical world is *prima facie* easy to reconcile with the thought that nature in general has issued from the hand of a wise and beneficent creator. It would seem, in fact, that the most we could reasonably hope to establish by following this path would be the formative operations of a suprahuman "artistic understanding" *(Kunstverstand)* sufficient to account for "miscel-laneous ends" of the sort natural organisms exemplify. But that is a far cry from being entitled to infer that the world as a whole is the product of a presiding moral divinity with an overarching end or purpose in view. And if we confine ourselves to the theoretical contemplation of nature alone it is unclear how such an inference could conceivably be justified. There is nothing in the natural order when considered solely by itself which can properly be held to qualify as an unconditioned or final end of creation capable of endowing it with meaning and value in our eyes.

The various weaknesses of the argument from design, referred to by Kant himself as "physico-theology," do not however require us to suppose that no such ultimate end can be identified. This becomes apparent if we turn aside from theoretical considerations and approach the matter from the standpoint of practical reason as exhibited in our moral experience. When looked at in that perspective it is evident that man emerges as the only possible candidate—"without man…the whole of creation would be a mere wilderness, a thing in vain, and have no final end" (Part II, p. 108). In our capacity as moral agents we are aware of having a status which sets us apart from the rest of the natural order and which uniquely assigns to our existence intrinsic worth. For it is a presupposition of the moral consciousness that, regarded as rational beings possessing freedom of choice and volition, we are able to act under laws and pursue objectives that originate, not in nature, but in ourselves. In Kant's words:

> Only in man, and only in him as the individual being to whom the moral law applies, do we find unconditional legislation in respect of ends. This legislation, therefore, is what alone qualifies him to be a final end to which entire nature is ideologically subordinated.
>
> (Ibid., p. 100)

How is this supposed to be relevant to the issue that physico-theology tries but fails to resolve—the existence of God as "the supreme cause of nature and its attributes"? It is Kant's contention that, while a theoretical appeal to our experience of nature cannot legitimize theological claims, there is a sense in which a recognition of what is essentially involved in our vocation as moral agents may be said to do so. Following the line of thought articulated in his second *Critique,* he argues that practical reason sets

before us as an *a priori* obligation the project of promoting what he calls the *summum bonum,* "the highest good *in the world* possible through freedom" (Part II, p. 118). Such a goal is held to constitute an ideal state of affairs wherein human happiness would be appropriately proportioned to moral desert, a condition that manifestly does not obtain in life as we know it but which we are nonetheless called upon to help to realize. Granted, however, that this is something morality obliges us to pursue as a duty, it follows that we must believe it to be ultimately attainable; and that consideration, when taken in conjunction with the limitations to which we are inescapably subject as finite and imperfect members of the world, requires us to assume the existence of a "moral author" of nature capable of ensuring that our efforts will not turn out to be finally vain. Kant thinks that someone who, though in general righteously disposed, does not assume this will inevitably be "circumscribed in his endeavour," eventually abandoning any attempt to further the project in question on the ground of its impracticability. If, on the other hand, such a person resolves to be faithful to the call of their "inner moral vocation" and acts accordingly, they thereby show themselves to be committed to "the existence of a *moral* author of the world, that is, of a God" (ibid., p. 121). Such an assumption, in other words, is essential if we are to "think in a manner consistent with morality"; to employ the terminology of the second *Critique*, it represents a "postulate" of pure practical reason. Admittedly, and as Kant points out in an important footnote, this argument still does not amount to an "*objectively* valid proof" of God; on critical principles that remains forever impossible. But it is nonetheless "sufficient *subjectively* and for moral persons" (ibid., p. 119). And given the necessary primacy for us of the moral law, he implies that it is all that we can properly ask for or need.

The priority that Kant assigns to what he calls "the moral proof" in the last part of the *Critique of Judgement* raises the question of what significance, if any, he is prepared to attribute to ideological conceptions of nature from a theological point of view. He certainly concedes that the traditional argument from design is worthy of respect; unlike other speculative arguments, it has appeared as persuasive to the understanding of the ordinary "man in the street" as it has to that of the "subtlest thinker." He implies, though, that this tends to be due to an unnoticed confusion between an ostensible reliance upon purely empirical factors and the underlying influence of "moral considerations to which everyone in the depth of his heart assents." When these two strands are carefully distinguished, it becomes clear that it is the second that actually produces conviction, any presumed dependence of the conclusion reached upon the "physico-teleological evidence" being in fact illusory. And he drives the point home by claiming that, even if as rational beings we inhabited a

universe in which nature showed no trace of features suggestive of physical teleology, the asseverations of practical reason regarding the existence of God would still retain their force. Yet all the same, and notwithstanding his insistence that "physico-theology is physical teleology misunderstood" (Part II, p. 108), he does not go so far as to declare that such a teleology is wholly irrelevant or otiose in the present context. Considered as affording the premises for a theoretical demonstration it is certainly useless to the theologian. But it does not follow that it has no subsidiary role to play.

Kant indicates, for instance, that it may at least function "as a preparation or propaedeutic," disposing the mind to entertain the idea of there being an "intelligent" source of nature and thereby rendering it "more susceptible to the influence of the moral proof." Furthermore, he also goes on to suggest that the abundance of material for teleological judgment which the actual world supplies can be said to serve us "as a desirable confirmation of the moral argument, so far as nature can adduce anything analogous to the ideas of reason (moral ideas in this case)" (Part II, p. 155). In trying to interpret this rather cryptic remark, it will be worth recalling again the notion—initially advanced in the Introduction to the *Critique*—of judgment's affording a mediating link between practical reason as the supersensible source of moral requirements and nature as constituting the sensible sphere wherein they are to be given effect and realized. Now according to Kant's moral proof we must believe that the pre-eminent objective reason sets before us is an attainable one, this belief involving as an indispensable condition our acceptance of the existence of God. But it is not easy from a human standpoint to give content to that idea without envisaging nature to be designed in a manner that makes the attainment of such an end possible. Thus the fact that innumerable natural phenomena seem to demand for their intelligibility the employment of teleological concepts may be welcomed as lending some reinforcement to the thought of nature's being purposively adapted to the practicable fulfillment of what the moral consciousness enjoins; for as Kant puts it: "the conception of a supreme cause that possesses intelligence… acquires by that means such reality as is sufficient for reflective judgement" (ibid.).

Even so, the problem of ultimately reconciling teleological and mechanistic interpretations of the natural world remains; and while Kant has allowed that a transcendent principle capable of subsuming or accommodating both might conceivably obtain at the level of a higher understanding, he at the same time reiterates the point that, so far as human knowledge is concerned, the conception of nature as a product of intelligent design can never be theoretically established or proved. Reflective judgment may perform a salutary service in supplementing assumptions to which, as a matter of moral necessity, we find ourselves

committed by practical reason. As, however, he has consistently maintained throughout the third *Critique,* in none of its forms can judgment itself be accredited with cognitive insight into what lies beyond the bounds of the phenomenal sphere. Such assurance as we have on the latter score can never be other than a moral assurance, one that holds good for us "from a purely practical point of view" (Part II, pp. 143–4).

CHAPTER 5

Fichte and Schilling: the Jena period

Daniel Breazeale

FROM KANT TO FICHTE

An observer of the German philosophical landscape of the 1790s would have surveyed a complex and confusing scene, in which individuals tended to align themselves with particular factions or "schools," frequently associated with specific universities or, in some cases, periodicals, and engaged in often bitter public controversies with their opponents. Within this context, Kantianism (or "the Critical philosophy," as it was styled by both its opponents and its exponents) was simply one party among others. Self-appointed representatives of "Enlightenment," inspired by English and French examples and pledging their allegiance to the legacy of Lessing, dominated more urbane intellectual circles, such as that of Moses Mendelssohn and his associates in Berlin. A more academic variety of rationalism was defended by the many proponents of the Leibnizian-Wolffian philosophy, which still dominated the philosophy departments of most German universities. At the same time, there was a widespread vogue for what was then called "popular philosophy," the adherents of which, though they usually shared the liberal assumptions and conclusions of the *Aufklärer* and Wolffians, based their philosophy not upon *a priori* reasoning, but upon an appeal to the testimony of "healthy common sense." In opposition to the dominant spirit of the age, these "popular philosophers" distrusted the systematic impulse and were suspicious of all attempts to turn philosophy into a well-grounded "science."

An even more extreme rejection of philosophy as a systematic science

was associated with Friedrich Jacobi and J.G.Hamann, two idiosyncratic but influential thinkers who employed skeptical arguments in order to reveal the fragility of human reason and hence the necessity and superiority of "faith." Another eccentric but influential figure was J.G.Herder, a philosophical naturalist who challenged the prevailing mechanistic models of the mind and of society and sought to replace them with more organic or vitalistic ones. Herder's ground-breaking work on the origin of languages and the role of history in the formation of human consciousness eventually led him to call for a "meta-critique" of philosophy's alleged neglect of the influence of language, culture, and history upon thought itself. Finally, there were also a few straightforward representatives of philosophical skepticism, such as G.E.Schulze and Ernst Planner.

All of these contending parties were united, however, in their opposition to the new Kantian philosophy, which was steadily gaining in prominence. Not only were several new journals dedicated to the promulgation of Kantianism, but a university chair was established for this purpose as well (at Jena in 1787). It is noteworthy, however, that the single work which played the greatest role in calling public attention to the Critical philosophy was not a book by Kant himself, but rather a series of popular "Letters on the Kantian Philosophy" published in 1786–7 in the widely circulated *Allgemeine Literatar-Zeitung*. These "Letters" were the work of K.L.Reinhold (1756–1823), an ex-Jesuit and enthusiastic convert to the new Critical philosophy. The most striking feature of Reinhold's "Letters" is their strong emphasis upon the *practical* or *moral* consequences of Kant's thought. Consequently, it was not as a new theory of knowledge or even as a critique of metaphysics that Kant's philosophy first attracted widespread attention, but instead, as an ingenious defense of freedom, morality, and religion: a doctrine of "practical belief" which was simultaneously able to acknowledge the (limited) legitimacy of the modern scientific worldview. On the strength of his fame as author of the "Letters," Reinhold was named as the first occupant of the new chair in Critical philosophy established at Jena in 1787.

To the consternation of many of Kant's more literal-minded followers, Reinhold proved to be a rather unorthodox adherent of the new transcendental philosophy and immediately embarked upon an ambitious project of reformulating and revising Kant's philosophy. Though Reinhold was quite prepared to endorse all of Kant's conclusions, he found Kant's specific arguments and "derivations" to be somewhat lacking in inner coherence and systematic rigor. According to Reinhold, transcendental philosophy could become genuinely "scientific" only by being recast in the form of a deductive system based upon a single, self-evidently certain, "absolutely first principle," from which, in turn, everything else (e.g. the

famous distinction between "thought" and "intuition," with which Kant's theoretical philosophy begins) could be "derived."

Reinhold gave the name "Elementary Philosophy" (or "Philosophy of the Elements") to his revised version of Kantianism, and argued that the latter alone was able to provide Kant's writings with the systematic form and scientific foundation which they themselves lacked. By analyzing the bare concept of "representation," Reinhold obtained the first principle of his system, the "principle of consciousness," and from this first principle he then proposed to derive the distinction between intuition and thought, along with all of familiar Kantian faculties and categories.

Reinhold's Elementary Philosophy is historically significant for two reasons: First of all, Reinhold's explicit criticism of the "letter" of Kant's own presentation of his philosophy, and especially his criticism of the duality of Kant's starting point and the *ad hoc* character of some of his arguments, promoted a general demand for a more coherent and systematic exposition of Kant's philosophy. Second, Reinhold's specific program for accomplishing this task—viz., by deriving the entire Critical philosophy from a single first principle—stimulated others (above all, Fichte) to seek an even more "fundamental" first principle upon which philosophy in its entirety could be "grounded."

Another prominent feature of Kant's philosophy which was subjected to early criticism (though in this case not by Reinhold) concerned the problematic status of "things in themselves" within the Critical philosophy. The most influential early critic of Kant on this point was F.H.Jacobi (1743–1819), who was a well-known author of sentimental novels, as well as of several influential philosophical (or rather, antiphilosophical) works. In 1787 Jacobi devoted the Appendix to his *David Hume on Belief, or Idealism and Realism* to an examination of transcendental philosophy, and he focused his criticism upon Kant's apparently conflicting remarks concerning the status of "things in themselves." Jacobi concluded that the entire doctrine was incoherent, since, as he put it, one had to assume the existence of things in themselves in order to obtain entry in Kant's philosophy, only to discover upon entry into the same that such a doctrine is incompatible with the transcendental account of "objectivity" made possible by that same philosophy. For followers of Kant, therefore, the challenge was clear: to defend transcendental idealism from Jacobi's criticism without following Jacobi himself into a wholesale rejection of philosophical speculation and embrace of a fideistic celebration of "not-knowing."

Similar objections to treating the thing in itself as the transcendent ground of sensations were advanced by Salomon Maimon (*c.* 1752–1800), a largely self-educated Polish-Russian Jew and the author of the extraordinarily original *Examination of Transcendental Philosophy*

(1790). For Maimon, however, the lesson to be drawn from the untenability of Kant's doctrine of things in themselves was not the need to abandon reason for immediate feeling and faith, but rather, the desirability of constructing a more "skeptical" variety of Kantianism, one shorn of all transcendent remnants and aware of its own limitations. To this end, Maimon attempted to rehabilitate the Leibnizian notion of an "infinite understanding," from the perspective of which the distinction between sensibility and thought, content and form, would disappear.

Another influential critic of the new transcendental philosophy was G.E.Schulze, self-styled "Humean skeptic" and author of the anonymously published *Aenesidemus, or concerning the Foundations of the Elementary Philosophy Propounded at Jena by Prof. Reinhold, Including a Defense of Skepticism against the Pretensions of the Critique of Reason* (1792). In attacking the Critical philosophy, Schulze not only repeated many of Jacobi's and Maimon's specific criticisms but added some new ones of his own, including an objection to the very idea of "the primacy of practical reason."

In addition to the various internal difficulties within Kant's writings, Kant's first generation of readers also had to grapple with what might be thought of as the external problem of the relationship between the various *Critiques,* a problem which, of course, ultimately concerns nothing less than the systematic *unity* of the Critical philosophy. How is the worldview of the first *Critique* to be squared with that of the second? Despite Kant's own attempt to address this problem, first in the Transcendental Dialectic of the *Critique of Pure Reason,* and then in the Introduction to the *Critique of Judgment,* many readers remained uncertain about how the deterministic worldview of Kant's theoretical philosophy could be reconciled with the account of freedom and self-determination presented in his practical philosophy. There was also widespread confusion regarding the relationship between the various "subjects" (or "I's") encountered in the various *Critiques.* Is the pure subjective spontaneity that accounts for the transcendental unity of apperception (i.e. "the transcendental I") identical with the freely acting and self-legislating practical agent ("the practical I")? And how are these "I's" related, in turn, to empirical self-consciousness and to embodied persons? Finally, many sympathetic readers expressed serious reservations concerning the overall "architectonic" of the Critical philosophy. How, precisely, are the claims of theoretical philosophy related to those of practical philosophy? Indeed, what is the epistemic status of philosophical claims themselves? What kind of "knowledge" does philosophy convey, and how is such knowledge established?

Such was the philosophical context within which the achievements of Fichte and Schelling must be understood and evaluated. Everyone agreed

that, for better or for worse, philosophy was in a period of extraordinary crisis and ferment. Even as the magnitude of Kant's accomplishment was becoming increasingly apparent, it was also becoming obvious—to Kant's more perspicacious defenders as well as to his critics—that any successful defense of the Critical philosophy would have to be more than a mere restatement of the same. Instead, what would be required would be a further advance down the road first opened by Reinhold's Elementary Philosophy; only by abandoning the "letter" of Kantianism, or so it seemed, could its "spirit" be preserved.

J.G.FICHTE'S JENA *WISSENSCHAFTSLEHRE*

Johann Gottlieb Fichte (1762–1814), son of a Saxon ribbon weaver, university dropout, and itinerant tutor, first encountered Kant's writings in 1790, and the effect was immediately galvanizing. "I have been living in a new world ever since reading the *Critique of Practical Reason,*" he reported to a friend.

> Propositions I thought could never be overturned have been overturned for me. Things have been proven to me which I thought could never be proven—e.g. the concept of absolute freedom, the concept of duty, etc.—I feel all the happier for it.... Please forgive me for saying so, but I cannot convince myself that prior to the Kantian critique anyone able to think for himself thought any differently than I did, and I do not recall ever having met anyone who had any fundamental objections to make against my [previous, deterministic] system. I encountered plenty of sincere persons who had different—not *thoughts* (for they were not at all capable of thinking) but different—*feelings*.
>
> (III, 1:167)[1]

As this passage poignantly testifies, what attracted Fichte to transcendental idealism was his conviction that it alone was able to reconcile human freedom and natural necessity, moral sentiments and rational judgments, "feelings" and "thoughts." It is no exaggeration to say that Fichte devoted the rest of his life to the task of explaining and expounding the philosophy which, he believed, makes such a reconciliation possible. Though he soon confessed to nagging doubts concerning certain details of Kant's own presentations of his philosophy, Fichte never entertained any doubts concerning the fundamental truth of

the latter, at least insofar as its "spirit" was concerned—a spirit which Fichte was convinced was even better expressed in his own philosophy, which he succinctly characterized in 1795 as "the first system of human freedom" (III, 2:298).

Barely two years after his first encounter with Kant's writings, Fichte was unexpectedly propelled to fame with the publication of his first book, *Attempt at a Critique of All Revelation* (1792). Through circumstances which have never been adequately explained, the book in question, issued by Kant's own publisher and dealing with an important topic (viz., revelation, considered as the "appearance" of noumenal reality within the phenomenal world) raised by the Critical philosophy but not yet explicitly dealt with by Kant himself, was originally published anonymously. Not surprisingly, it was immediately and widely hailed as the latest publication by Kant himself. Thus, as soon as the author's true identity became known, Fichte's fame as a philosophical author was assured, since it was now too late to retract all of the extravagant praise the book had already received.

The young author's notoriety was only increased by his next two publications, *A Discourse on the Reclamation of the Freedom of Thought from the Princes of Europe, who have hitherto Suppressed it* and the first installment of *A Contribution toward Correcting the Public's Judgment of the French Revolution*. Though both works were published anonymously in 1793 in Danzig (where Fichte was once again employed as a private tutor), the author's identity was widely known. Thus, in addition to his growing renown as the "third sun in the philosophical heaven," Fichte also acquired an early reputation as a fiery Jacobin, a reputation which guaranteed him political as well as philosophical enemies during his career at Jena.

When Reinhold unexpectedly resigned his chair at Jena in the spring of 1794 it was immediately offered to Fichte, who at this point was living in Zurich in the home of his new father-in-law and was completely engrossed in a vast project of constructing his *own* version of transcendental idealism, one which would heed Reinhold's call for a system based upon "a single first principle," but would do so in a manner which would avoid the published criticisms of Jacobi, Maimon, and Schulze. It was during this period that Fichte decided that his new philosophy deserved a new name. Accordingly, since he wished to emphasize that his new, "rigorously scientific," philosophy would represent something more than mere "love of wisdom" (or "philosophy"), he baptized it "*Wissenschaftslehre*" (that is, "theory of science" or "doctrine of scientific knowledge"—*not* "science of knowledge").

Fichte, who more than anything else wished for his own philosophical efforts to make a positive contribution to the improvement of human life, could hardly afford to decline the offer from Jena, which would guarantee

the maximum amount of exposure for his new system. Accordingly, he began lecturing on his new philosophy in the summer of 1794, though not before publishing a brief and "hypothetical" introduction to the same in the form of a meta-philosophical treatise entitled *Concerning the Concept of the Wissenschaftslehre, or of so-called "Philosophy"* (1794).

Even though Fichte had not yet completed the task of thinking through even the rudiments of his new system at the time of his arrival at Jena, he nevertheless immediately began lecturing on the "Foundations of the Entire *Wissenschaftslehre*." These lectures, which continued through the winter semester of 1794–5, represent Fichte's first attempt at a full-scale public presentation of his philosophy. For the convenience of his students, he had the text of his lectures printed and distributed (in fascicles) over the course of the two semesters. However, he soon agreed to have these printed fascicles bound together and issued as a book, or rather, as several books: *Foundations of the Entire Wissenschaftslehre,* Parts I and II (1794) and Part III (1795), and *Outline of the Distinctive Character of the Wissenschaftslehre with respect to the Theoretical Power* (1795)—though the title page of each of these volumes still included the words "published as a manuscript for the use of his students."

There is considerable historical irony in the fact that this "book," the first parts of which appeared in print well before the later portions had even been drafted, became (and to this day remains) Fichte's best-known and most influential philosophical work. It is intriguing to wonder what the "history of German Idealism" would have been like if the call to Jena had not come in 1794 and if, instead, Fichte had been allowed the leisure to develop and to publish his philosophy at a somewhat less frantic pace. But, of course, such speculation is as idle as it is intriguing, for the fact is that the full text of the *Foundations,* along with that of the *Outlines,* was fatefully set before the reading public in the summer of 1795.

Fichte himself was, from the first, deeply dissatisfied with the *Foundations,* which he wished his auditors and readers to treat as no more than a provisional presentation of the basic principles of his system. Accordingly, when he next returned to this topic, that is, in the lectures on the "Foundations of Transcendental Philosophy *(Wissenschaftslehre) nova methodo*" which he first delivered in 1796–7, he offered his students a completely revised and very different presentation of the basic principles and outlines of his philosophy. Apparently, he was relatively satisfied with this new presentation (the socalled "*Wissenschaftslehre nova methodo*"), for he repeated these lectures twice more during his career at Jena. Indeed, he fully intended to revise them for publication and, in 1797–8, succeeded in publishing two "introductions" to, as well as the first chapter of, this new version, under the title *An Attempt at a New Presentation of the Wissenschaftslehre* in the *Philosophisches Journal einer Gesellschaft*

Teutscher Gelehrten, of which he was then co-editor.

However, Fichte did not confine himself to refining his presentation of the foundations of his philosophy; he also devoted a great deal of effort to fleshing out the systematic scheme merely alluded to in his programmatic writings. He did this in his lectures on *Naturrecht* (or "natural right") and ethics, subsequently published as *Foundations of Natural Right according to the Principles of the Wissenschaftslehre* (1796–7) and *The System of Ethical Theory according to the Principles of the Wissenschaftslehre* (1798). Though he announced that he would lecture on a third systematic subdivision of the *Wissenschaftslehre,* viz., philosophy of religion, during the summer semester of 1799, the lectures in question were never delivered.

Fichte was embroiled in one controversy or another (often involving his political views) from the moment of his arrival in Jena, but the final one, the so-called "atheism controversy," proved to be his undoing. In 1798 he had published a brief article entitled "Concerning the Basis of our Belief in a Divine Governance of the Universe," in which he bluntly criticized all attempts by philosophers to infer the existence of God from the fact of the moral law—or from anything else. His many local enemies seized upon this article to incite broader opposition. He was officially charged by the Saxon authorities with atheism, which provoked a very public controversy between Fichte's opponents and defenders. Eventually, and largely as a result of his own tactical miscalculations, he was dismissed from his academic post. In the summer of 1799 he moved to Berlin.

For Fichte, 1799 was a year filled with disappointment. Not only did he lose his job, but he also began to lose many of his most prominent philosophical allies, including Reinhold, who had briefly become an enthusiastic exponent of the *Wissenschaftslehre*. Schelling, the most conspicuous and prolific of the young "Fichteans," continued, despite Fichte's disapproval, to pursue his interest in "the philosophy of nature," while Jacobi, whom, for all their philosophical differences, Fichte greatly admired, published a long *Open Letter to Fichte,* in which he devastatingly characterized the *Wissenschaftslehre* as "nihilism." Finally, in August 1799, Kant himself issued a public "declaration" in which he repudiated Fichte's system and disavowed any relationship between his own philosophy and the *Wissenschaftslehre*. "One star sets, another one rises," shrugged Goethe, when informed of Fichte's departure from Jena.

When Fichte arrived in Berlin (where there was, as yet, no university) he was forced to earn his living from his writings and from occasional, privately subscribed lessons and lectures. His first project was a "popular" presentation of his philosophy, one specifically designed to rebut the charge of atheism and to reply to Jacobi's more general criticisms of transcendental philosophy. The resulting book, *The Vocation of Man,* was

published in 1800, closely followed by a rather bold foray into political economy *(The Self-Contained Commercial State)*. Still attempting to defend himself against what he viewed as widespread misperceptions of his position, Fichte then published the pathetically titled *Crystal-Clear Report to the General Public concerning the Actual Essence of the Newest Philosophy: an Attempt to Force the Reader to Understand* (1801), in which he emphasized the philosophical differences between the *Wissenschaftslehre* and rival systems of thought.

At the same time, he continued to revise and recast his "scientific" presentation of the first principles of his system; indeed, he himself accurately characterized the period 1800–4 as one of "ceaseless work on the *Wissenschaftslehre*." Finally abandoning his efforts to revise for publication his 1796–9 lectures on *Wissenschaftslehre nova methodo,* he once again drafted an entirely new version of the foundations of his philosophy, which he presented in a course of private lectures delivered in Berlin in 1801–2. Once again, however, dissatisfaction with the results prevented him from publishing this new version and impelled him to embark upon yet another, even more thoroughgoing systematic overhaul of his presentation. These efforts culminated in the year 1804, in the course of which Fichte delivered three separate sets of lectures on the *Wissenschaftslehre*. Though he expressed complete satisfaction with this latest version and readied it for publication, he appears finally to have concluded that he himself was simply incapable of producing a written exposition of his own philosophy which could stand on its own and avert the sorts of misunderstanding to which his Jena writings had been subjected. For the rest of his life he vowed "to confine himself to oral communication, so that misunderstanding can thereby be detected and eliminated on the spot" (III, 5:223). In 1804 he also delivered a well-received series of more popular lectures *On the Characteristics of the Present Age* (subsequently published in 1806), in which he dealt, for the first time, with the philosophy of history.

Fichte spent the summer semester of 1805 at the Prussian University at Erlangen, where he prepared and lectured upon yet another presentation of the first principles of his philosophy. Upon his return to Berlin in 1806 he delivered yet another set of "popular" lectures, *Directions for a Blessed Life,* which were published later that same year. These lectures reveal the strong influence of the Gospel of St John on Fichte's thinking at this point and contain what is perhaps the most accessible presentation of the new, more religiously oriented, and "mystical" tendency of his thought during his final years.

With the defeat of Prussia by Napoleon's armies in 1806 and the occupation of Berlin, Fichte took refuge in Königsberg, where he served briefly as a professor, producing for his lectures yet another version of the

Wissenschaftslehre. After the Peace of Tilsit, however, he returned to Berlin, where he delivered his celebrated *Addresses to the German Nation* under the noses of the occupying forces. These lectures, in which Fichte attempted to kindle a sense of distinctively "German" patriotism and outlined a program of national education for this purpose, were published in 1808 and subsequently exercised a wide influence upon the development of German nationalist sentiment.

Fichte was also instrumental during this period in establishing the new University of Berlin. When the university was finally opened in 1810, he served as head of the philosophical faculty and, briefly, as rector of the university. He remained a professor at the new university until his death in 1814. During these years he lectured on a variety of subjects, including the first principles of his *Wissenschaftslehre* (of which he produced at least four more versions after 1810), political philosophy (or "doctrine of the state"), philosophy of right, and a popular introduction to philosophy under the title "the facts of consciousness." None of these new lectures were published by Fichte, though in 1810 he did publish a cryptic overview of the latest version of his system, *The Wissenschaftslehre in its General Outline*. Fichte died unexpectedly at the age of 51, of typhus, which he contracted from his wife, who had been infected by wounded soldiers she was nursing.

Let us now turn to a consideration of Fichte's *Wissenschaftslehre,* limiting ourselves to the version which exercised the greatest influence upon his contemporaries, that is, the "Jena *Wissenschaftslehre*" of 1794–9. In doing so, it is vital to recall that the term "*Wissenschaftslehre*" does not refer to any particular book or even any specific presentation of Fichte's system. In its broadest sense, "*Wissenschaftslehre*" is simply Fichte's proposed new name for "philosophy" itself, understood not as a form of "practical wisdom," but rather as a rigorous, systematic "science." Thus, in *Concerning the Concept of Wissenschaftslehre,* Fichte identifies *Wissenschaftslehre* with "the science of science itself," with knowledge about the very conditions, foundations, and limits of knowledge. (To be sure, this means that philosophy, *qua* "science of science" or "knowledge of knowledge," involves a certain, unavoidable degree of circularity. But, as Fichte argues persuasively in *Concerning the Concept,* such circularity—once it has been clearly grasped—is not an objection to philosophy, but is, instead, one of its most distinctive and unavoidable features.)

Somewhat more narrowly construed, "*Wissenschaftslehre*" is Fichte's new name for "transcendental idealism" or "Critical philosophy" —in contrast to the previously prevailing systems, which Fichte lumped together under the name "dogmatism" and believed was best represented by Spinoza. The essential features of a *Wissenschaftslehre* in this narrower

sense are, first of all, that it follows Kant in insisting that genuinely philosophical questions are those of justification or warrant *(quid juris)* rather than questions of "fact" *(quid facti)*. Consequently, the actual arguments and deductions which constitute philosophy as *Wissenschaftslehre* cannot be based upon an appeal to the so-called "facts of consciousness," since the task of such a science is to "explain" or account for these very "facts." More specifically, the particular set of facts which a *Wissenschaftslehre* has to account for in the first instance are those associated with our experience of an external world of objects. Or rather, limiting ourselves to the standpoint of consciousness, what philosophy has to explain is the presence within human consciousness of "representations accompanied by a feeling of necessity." Hence the question posed by the *Wissenschaftslehre* is as follows: "What is the connection between our representations and their objects? To what extent can we say that something independent of our representations, something altogether independent of and external to us, corresponds to our representations?" (I, 3:247). What has to be explained, in short, is "how representing becomes knowing."

Second, the "explanation" of cognition provided by the *Wissenschaftslehre* must be rigorously "transcendental" in character, in the sense that it must begin with something it regards as certain or beyond controversy (e.g. in Kant's case, the continuous self-identity of the knowing subject over time) and then enquire into the necessary conditions for the possibility thereof.

Third, a *Wissenschaftslehre* takes very much to heart the Kantian insistence upon "the primacy of practical reason." This does not mean simply that it recognizes the integrity and autonomy of the moral or "practical" sphere and resolutely refuses to countenance any standpoint that treats our consciousness of our own freedom as illusory. Instead, the *Wissenschaftslehre* insists that "the practical power is the innermost root of the I" (I, 3:332); and, basing itself upon this insight, it attempts to demonstrate that "our freedom itself [is] a theoretical determining principle of our world" (I, 5:77). What a transcendental idealism of this sort has to demonstrate is that only a free and practically striving I can have any experience of a world of spatio-temporal, material objects, and the overall deductive strategy of the *Wissenschaftslehre* is to demonstrate this by showing that the latter is a condition for the former. This is the sense in which "theoretical reason" is based upon "practical reason." (Of course, there is also an important sense in which the converse is true: since, according to Fichte anyway, practical striving presupposes theoretical awareness of a goal.)

Finally, there is a third, even narrower sense of "*Wissenschaftslehre,*" in which the term is synonymous neither with philosophy in general nor with

transcendental idealism as such, but refers instead to Fichte's own, distinctive version of the latter. Although Fichte himself never relinquished his long-standing claim that "the *Wissenschaftslehre* is nothing other than the Kantian philosophy properly understood" and consequently always sought to minimize the differences between his own system and Kant's, it must nevertheless be conceded that there are many striking differences between the "letter" of his philosophy and that of Kant's.

For example, Fichte's version of transcendental idealism follows Reinhold in claiming to base everything upon a single, absolutely certain "first principle." By proceeding in this rigorously "deductive" manner, Fichte believed, the *Wissenschaftslehre* would be able to produce a more elegant and successful derivation of the *a priori* categories of possible experience—including space and time. (The deductive strategy of the *Wissenschaftslehre* makes it possible to dispense with the Kantian distinction between "transcendental aesthetics" and "transcendental logic," and thus tends to identify "forms of intuition" and "categories of thought.") By deriving everything from a single starting point the *Wissenschaftslehre* could also hope to avoid the problems of systematic unity which plagued Kant's writings. Not only would it be able to exhibit the "common root" of intuition and thinking, but, even more significantly, it would be able to demonstrate, in a systematic manner, the intimate link between theoretical and practical reason, the realm of nature and that of freedom. (This last point marks a major advance beyond Reinhold's Elementary Philosophy, which confined itself almost entirely to an account of theoretical reason.)

Or, to cite another example of the manner in which Fichte's philosophy advanced beyond the letter of Kant's, there is no room within the *Wissenschaftslehre* for any reference, however minimal or tangential, to "things in themselves." Having absorbed the arguments of Kant's critics, Fichte firmly rejected any appeal—within the context of a philosophical account of experience, though not, of course, within the context of everyday life, where such appeals are not only appropriate but unavoidable—to what he characterized as the "non-thought of things in themselves." In contrast to philosophical "dogmatism," which vainly attempts to explain representations as "produced" within the mind by external objects, and which thus pretends to derive consciousness from things, a genuine transcendental idealism or *Wissenschaftslehre* adopts the opposite strategy; that is, it tries to show how our experience of "things" is a consequence of the character of consciousness itself. If philosophy is to remain transcendental and is not to become transcendent, then the undeniable "objectivity" of the world of ordinary experience will have to be accounted for purely in terms of consciousness and its acts. This means that transcendental philosophy must demonstrate that "the representation

and the object that is supposed to correspond to it are one and the same thing—merely regarded from two different points of view" (I, 3:252). It accomplishes this by showing that consciousness must operate in certain ways if selfconsciousness (which, for Fichte as for Kant, is the starting point of the entire deduction) is to be possible at all. It is the "necessity" of these modes of acting which accounts for the "feeling of necessity" which accompanies certain representations, and thereby accounts for the experienced "objectivity" of the world. (The sort of idealism which merely asserts that mind "constructs" reality but does not offer a rigorous deduction of the *necessity* with which it acts in doing so is dismissed by Fichte as "transcendent idealism.")

Turning now to the Jena *Wissensckaftslehre,* let us begin with an examination of its first principle or starting point. Obviously, it is not sufficient that the "first principle" of all philosophy be a proposition from which all of the other propositions of the system can be derived; in addition, the principle in question must also be *true*. But how can the truth of this highest principle be established? Its truth cannot be derived from some higher principle or set of principles, for then the principle in question would not be "first." Hence the first principle, if it is to be true at all, must be immediately true; it must express something that is self-evidently certain. (To be sure, *that* this self-evident certainty is *also* the "first principle" of all philosophy is by no means self-evident; instead, this can be established only by actually erecting a system upon the certainty in question.)

What then is the first principle of the Jena *Wissenschaftslehre*? Though casual readers of the *Foundations of the Entire Wissenschaftslehre* sometimes assume that Fichte begins with the logical principle "A=A," a closer reading of the famous § I of this text reveals that the first principle in question is not the abstract logical principle of identity, which is employed purely as a preliminary "clue" for the discovery of the actual first principle of the system: viz., the material proposition which states that "the I simply posits itself." This principle expresses what Fichte believes to be the supreme act of the mind, an act in which the I is simultaneously subject and object. (Such an act is "supreme" in precisely the same, transcendental sense in which Kant considered the transcendental unity of apperception to be "supreme.")

Though there is certainly a sense in which the *Wissenschaftslehre* may be construed as a continuation of the Cartesian project of basing philosophy as a whole upon the alleged self-evidence of the *cogito,* there is also a crucial difference concerning the status of "self-consciousness." For Fichte, self-consciousness (and hence all consciousness, since the underlying strategy of the entire enterprise is to show that the latter is but a special instance of the former) cannot be understood as a "fact," no

matter how privileged; nor can it be comprehended as an accident of some substance or a modification of some "being." Instead, it must be understood as an *activity,* albeit of a most extraordinary, self-productive type. To employ Fichte's own terminology, the self-positing of the I, which alone makes possible every act of empirical self-consciousness, and indeed, object-consciousness, is a "fact/act" or *Tathandlung*. It presupposes no prior "subject" which acts; it constitutes itself, *qua* self-consciousness, in the very act of becoming conscious of itself.

From this it follows that the "being" of the I is, so to speak, a consequence of its self-positing. Indeed, this, according to Fichte, is precisely what it means to be a "free being." A similar thought has been expressed in our own century in the formula that, where human beings are concerned, "existence precedes essence."

Thus, in order to "explain representations" Fichte invokes an original act of consciousness which is not an act of mere "representing" at all, but is equally and at the same time an act of production, indeed autoproduction. Thus the starting point of the Jena *Wissenschaftslehre* is equally "practical" and "theoretical," for the act described in its first principle ("the I simply posits itself") is a "doing" as well as a "knowing." Indeed, it is precisely because Fichte's system commences with and proceeds from "that supreme point from which the practical and the speculative appear as one" (III, 2:395) that it can hope to succeed in its overall goal of reconciling freedom and necessity, morality and nature.

This choice of a starting point has equally dramatic implications for the narrower field of theoretical philosophy proper (that is, for that portion of philosophy which accounts for our experience of an external world of spatio-temporal objects), for it establishes, from the very start, the essential identity of *ideality* (being for consciousness) and *reality* (being in itself). An I is an I only insofar as it posits itself—i.e. is aware of itself as an I. Since the unity of being and thinking is explicitly present in our original starting point, it follows that it will be (implicitly) present in everything derived therefrom. Everything that "is" is only insofar as it is "for the I"; i.e. "being" is not an original category within the *Wissenschaftslehre,* but is only a subsidiary or "derived" one.

The nature of this starting point is further clarified in Fichte's second attempt at a presentation of the outlines and first principles of his system (viz., in the *Wissenschaftslehre nova methodo* and the fragmentary *Attempt at a New Presentation*). It is here, in the presentation of 1796–9, that the initial act of self-positing with which the *Wissenschaftslehre* begins is described as an "intellectual intuition." Though Fichte's use of this term has produced a great deal of confusion (and though his remarks on the topic are not always as clear or as consistent as one might wish), the term "intellectual intuition" simply designates the previously described

"act" *(Tathandlang)* of pure self-consciousness, within which the I is supposed to be immediately present to itself, thereby constituting itself as an I, at the same time that it distinguishes itself as an object of consciousness from itself as the subject thereof. Such an act deserves to be called an "intuition" (in the Kantian sense) because the object of consciousness is in this case *immediately* present. But since the object in question (the I itself) is not "given" to consciousness in this case, but is *produced* thereby, the intuition is "intellectual" rather than sensory.

One should note that it is not Fichte's claim that such an original intellectual intuition can *ever* occur within empirical self-consciousness. On the contrary, he frequently reminds his readers that "this absolute identity of subject and object within the I can only be inferred and cannot be immediately evinced as a 'fact of consciousness' " (I, 5:21). However, philosophical reflection upon our own, necessarily divided self-consciousness can lead us to *the inference* that such an original unity must necessarily underlie and condition every empirical act of consciousness (within which the reflecting subject is in fact never discovered to be identical with the object of reflection). Only if there is an original unity of self-consciousness can we account for our abiding sense of our own identity, despite the fact that within every moment of empirical consciousness we find our identity divided between that of the subject and that of the object.

Thus, whereas the formal presentation of the "foundations" of the system begins with a description of the ungrounded *Tathandlung* or self-positing of the I, actual philosophizing, i.e. recapitulating for oneself the series of deductions which constitute the *Wissenschaftslehre,* begins instead with a free act of reflective abstraction on the part of the would-be philosopher. This act of turning one's attentions away from all objects and toward the operations of one's own consciousness is not an act of "intellectual intuition" of the sort attributed to the pure I which the philosopher is trying to study. (If Fichte sometimes uses the term "intellectual intuition" to designate the act of introspection or self-observation engaged in by the philosopher, then one must carefully distinguish *this* use of the term from its other, more fundamental employment to designate the I's original act of self-positing.)

The philosopher, meanwhile, after having abstracted from the "facts of consciousness," then seeks (within the artificial context of their philosophical account) to re-establish that same realm of facts, and they accomplish this by showing *why* and *how* the I must posit such a realm if it is to posit itself at all. This is how transcendental philosophy answers the *quid juris*.

But why should a philosopher begin with precisely *this* abstraction? Why should we commence with the bare thought of what Fichte calls

variously "the absolute I," "I-hood," "the intellect," or simply "reason" (rather than beginning, for example, with the abstraction of a "thing in itself")? What is it that makes this mere idea of an original self-positing subject *certain*? Fichte's reply is instructive: The initial certainty of his proposed starting point is not theoretical at all, but is, instead, *practical*. The autonomy of the I, which is, after all, what is asserted in the formula that "the I simply posits itself," is something one must confirm for oneself within one's own moral experience. To the extent that one is aware of oneself as a free agent, to this extent one is *actually* aware of oneself as a self-positing I.

To be sure, theoretical/philosophical doubts concerning such an awareness always remain possible. This is why skepticism cannot be avoided by purely theoretical means. Instead, what keeps us from doubting the proposed starting point is our sense of moral obligation to determine our own actions, that is to say, our indefeasible awareness of our own freedom. The reason, therefore, why the transcendental idealist comes to a stop with the proposition "the I freely posits itself" is not because they are unable to entertain theoretical doubts on this point or because they cannot continue the process of reflective abstraction. Instead, as Fichte puts it:

> I *cannot* go beyond this standpoint because I am not *permitted* to do so… I ought to begin my thinking with the thought of the pure I, and I ought to think of this pure I as acting with absolute spontaneity—not as determined by things, but rather, as determining them.
>
> (I, 4:220–1)

Thus the "categorical imperative" is invoked to secure the first principles of the entire *Wissenschaftslehre* (not merely of ethics), which illuminates Fichte's striking claim that the "*Wissenschaftslehre* is the only kind of philosophical thinking that accords with duty" (I, 4:219).

This also may help explain the notoriously *ad horninem* character of Fichte's polemic against those (the "dogmatists") who are unable or unwilling to accept the *Wissenschaftslehre*. What ultimately prevents them from doing so, according to Fichte, is not any deficiency of their intellect or any lack of philosophical acumen. Instead, the reason some people persist in attempting to understand consciousness in terms of things (rather than vice versa) is because they lack a lively sense of their own freedom. The defect in question is thus one which concerns their moral character. As Fichte put it in a sardonic footnote: "most men could more easily be convinced to consider themselves a piece of lava on the moon than an I" (I, 2:326 n.). The *Wissenschaftslehre,* however, is a philosophy for those who can and do conceive of themselves as free agents, and it is in

precisely this sense that Fichte could describe it as "from first to last, nothing more than an analysis of the concept of freedom" (III, 4:182).

After one has established for oneself via abstract reflection the first principle of the *Wissenschaftslehre* and has confirmed the truth of this starting point by appealing directly to one's own practical experience, one is then in a position to discover—again, by reflection and self-observation—all of the other acts which must *necessarily occur as well* if the postulated original act is to occur. Of course, just as we are never directly aware of the original act of self-positing which constitutes subjectivity as such, so we are not usually aware of these other, "necessary but unconscious" acts which are derived as conditions necessary for the possibility of this first act (though, of course, the transcendental philosopher becomes aware of them in the course of their enquiry). The *Wissenschaftslehre* is therefore described by Fichte as both (a) a process of raising to consciousness those unconscious acts by means of which the I "constitutes" the world of its experience and (b) nothing more than a complete (and often exceedingly complex) analysis of its own first principle.

The results of such an analysis, however, are sometimes surprising. For example, one of the more striking conclusions of the "analysis" of freedom carried out in the "foundational" portion of the Jena *Wissenschaftslehre* is that, although "the I simply posits itself," freedom is never "absolute" or "unlimited"; instead, Fichte unequivocally demonstrates that freedom is conceivable only as limited. Only finite freedom is actual, just as the only sort of consciousness which is actual is finite, empirical, and embodied. Only "limited" subjects exist as subject.

The conclusion of the *Foundations* and the *nova methodo* is the same: an I must posit itself in order to be an I at all; but it can posit itself only insofar as it posits itself as limited (and hence divided against itself). The limitation in question is first posited as a "feeling," then as a "sensation," then as an "intuition" of a thing, and finally as a "concept." All that we can say, from a transcendental perspective, concerning the original character of the "limitation" in question is to describe it in terms of the I's practical striving. This limitation is first described (in the 1794–5 presentation) as a "check" or *Anstoß* to the I's striving, a "check" which manifests itself within consciousness as "feeling." Though Fichte certainly demonstrates that such an *Anstoß* must in fact occur if self-consciousness is to be actual, he never claims that such a limitation is *produced* by the self-positing I, though he does, of course, observe that a limitation cannot exist (as a limitation of the I) unless it is "posited" as such (i.e. taken up into consciousness) by the I. On the other hand, Fichte steadfastly opposes all attempts to "explain" the *Anstoß* as an "effect" produced by the Not-I. The point is simply this: like the I itself, even the most rigorously

"scientific" and *a priori* philosophy finally must admit that there are *limits* to what can be explained. Philosophy can explain, for example, why the world has a spatio-temporal character and a causal structure, but it cannot explain why objects have the particular sensible properties they happen to have. This is simply what the I discovers—albeit "within itself" and not "out there"—when it reflects upon its own original limitations.

To be sure, philosophy can show that the I cannot posit its own freedom, i.e. cannot posit itself, *unless* it finds itself to be limited (and then, in turn, posits a world of objects as the ground of its own limited state—thereby, as it were, "explaining" to itself its own limitation). However, *that* the I, in fact, finds itself to be limited—and limited in a specific manner (="feeling")—is something that cannot be demonstrated *a priori;* instead, this is something "that everyone can prove to oneself only through one's own experience" (I, 2:390).

This first account of the original limitation of the I is supplemented (in the *Wissenschaftslehre nova methodo*) by an account of how the practically striving I is originally called upon to *limit itself* freely in response to a "summons" *(Aufforderung)* received from what it takes to be another free being similar to itself. To this degree, the 1796–9 presentation goes well beyond the 1794–5 version in demonstrating that self-consciousness also presupposes a recognition of and by others; for one can be conscious of oneself only as an individual, which in turn requires consciousness of a realm of rational beings of which one is but a single member. This important argument, which demonstrates that recognition of and by others is a condition for self-recognition, was first elaborated by Fichte in his *Foundations of Natural Right* and was subsequently incorporated into his presentation of the very "foundations" of the *Wissenschaftslehre*—though it must be admitted that the precise, relative roles of *Anstoß* and *Aufforderung* in the constitution of self-consciousness remain somewhat unclear.

Let us now turn from a consideration of the starting point and deductive strategy of the Jena *Wissenschaftslehre* to an examination of the overall, systematic structure of the same (as explained in the concluding section of the *Wissenschaftslehre nova methodo*). The presentation of a complete, transcendental system of philosophy should begin with a discussion and demonstration of the "basic principles" or "foundations" of such a system, and this is precisely what Fichte himself attempted to do, first in the *Foundations of the Entire Wissenschaftslehre* and *Concerning the Distinctive Character of the Wissenschaftslehre with Respect to the Theoretical Power,* and then, in a revised form, in his lectures on the *Wissenschaftslehre nova methodo*.

The "foundational" portion of the system begins by calling upon the reader to isolate for him- or herself the concept of the freely self-positing I

("think the I!"). Once this initial starting point has been established, it is followed by an elaborate, transcendental account of subjectivity as such, an account which includes step-by-step analysis (which Fichte calls "genetic explanation") of the various unconscious acts of the mind which are required for the possibility of self-positing and which are involved in the constitution of everyday experience. This analysis includes an extended account of the creative activity of the "productive imagination," understood by Fichte as that power of the I which mediates between free self-positing *(Tathandlung)* and limited self-feeling *(Anstoß)*. This first, "foundational" portion of the *Wissenschaftslehre* demonstrates how the "entire mechanism of consciousness is based upon various ways of viewing the separation of the subjective and the objective within consciousness, and, in turn, the union of both" (I, 5:21): hence the explicitly "dialectical" structure of the argument, which constantly oscillates between moments of relative identity and moments of relative difference.

Next come what Fichte terms the various "real" philosophical sciences which make up the further subdivisions of the entire *Wissenschaftslehre*. There are three such systematic subdivisions: "theoretical philosophy," "practical philosophy," and "philosophy of the postulates," within each of which the mind's general principles, laws, and modes of acting (all of which.have previously been derived within the "Foundations") are applied and extended within a specific and limited field.

A "specifically theoretical *Wissenschaftslehre*" or "*Wissenschaftslehre* of cognition" (not to be confused with the "theoretical" portion of the *Foundations*) concerns itself with the general features of what consciousness "discovers" in the course of its experience. Accordingly, this portion of transcendental philosophy presents us with a complete "theory of the world." It deals with what is *given* to consciousness, and it explains—to the severely limited extent that this can be explained philosophically—the necessary features of such a world. Hence, theoretical philosophy is limited to a consideration of *cognition,* that is, to an analysis of the specific type of consciousness within which the conscious subject considers itself to be "determined" by its objects. Theoretical philosophy shows what objects must be like for such consciousness to be possible, and in this sense it constitutes an *a priori* account of empirical reality as a whole, or of "nature." It thus determines the content of experience, but only to the extent that this content reflects the form of consciousness. This sort of theoretical philosophy of nature can indeed circumscribe experience, but it is in no way intended to supplant or to rival the empirical, natural sciences.

Though clearly Fichte envisioned such a "distinctively theoretical *Wissenschaftslehre*" (modeled, no doubt, upon Kant's *Metaphysical*

Foundations of Natural Science), he himself never completed such a science. The closest he came was in his *Concerning the Distinctive Character of the Wissenschaftslehre with Respect to the Theoretical Power,* which barely proceeds beyond the transcendental deduction of space, time, and causality.

In contrast with the purely "theoretical" portion of the system, the specifically "practical" *Wissenschaftslehre* views the object of consciousness as freely determined by the subject. Thus it treats objects (or "being") not as *given* to consciousness, but rather, as *produced,* and produced by a freely acting and conscious subject attempting to accomplish its own goals: hence Fichte's assertion that the practical *Wissenschaftslehre* views "being as a product of concepts." The usual name for such a science is "ethics" or "ethical theory" *(Sittenlehre)*. Ethics, or the distinctively practical portion of the overall system of the *Wissenschaftslehre,* examines not what is, but what ought to be. The "world" with which it is concerned is the world as it ought to be constructed by rational beings. Thus, in this portion of his system (though not elsewhere) Fichte really does interpret the world purely as an arena for moral striving—for this is how the world is actually viewed by the practically striving I (just as the theoretical or "knowing" I views it as something given to consciousness).

Fichte's *System of Ethical Theory* begins with a recapitulation of certain conclusions established in the "Foundations": e.g. (a) an awareness of one's own efficacy (i.e. of one's capacity to realize one's goal concepts) is a condition for the very possibility of self-consciousness, and (b) the I finds itself called upon (or "summoned") to limit itself freely in relation to other free beings. The specific task of *The System of Ethical Theory* is to indicate the particular duties and practicial corollaries which follow from the general obligation to limit oneself freely. Accordingly, this portion of the system can be described as a detailed analysis of conscience as such, or as an expanded enquiry into the form and content of the "categorical imperative." The result is a systematic account of duty as such, that is, of those duties which apply to all rational beings, without taking into account any of the individual differences between persons. Here again, the argument by means of which Fichte purports to establish this system of duties is strictly transcendental in character: the various "oughts" it establishes are presented as so many conditions for the possibility of the original "ought," i.e. as conditions for the possibility of autonomous self-determination.

The third and in many respects most original systematic subdivision of the *Wissenschaftslehre* is called by Fichte "philosophy of the postulates." This portion of the system is concerned with the relationship between the theoretical and the practical realms and examines the specific demands (or

"postulates") which each realm addresses to the other. Those postulates that theory addresses to the practical realm are the subject of the portion of the system entitled "theory of right" *(Rechtslehre)* or "natural right" *(Naturrecht),* whereas those postulates that practical philosophy addresses to the theoretical realm are the subject of the philosophy of religion.

Unlike ethics, which deals with rational (i.e. free) beings as such, the "theory of right" considers these same practical agents in their *individuality,* that is, as individual members of a community of free individuals. Such a philosophical science poses the question: How must the freedom of each individual be externally *limited* in order to permit every individual to pursue their individual goals to the fullest extent possible?

The *Foundations of Natural Right* begins with a general deduction of "intersubjectivity," that is, with a transcendental demonstration that a free individual can recognize itself as such only insofar as it recognizes the freedom of others, while simultaneously distinguishing itself from all of these other freely acting individuals. The next step is to stipulate the conditions for the possibility of such "mutual recognition" among free beings, the chief one of which is free acknowledgment of the legitimacy of the general rule of "right" or "justice," namely: "limit your own freedom in accordance with the concept of the freedom of all other persons with whom you come into contact" (I, 3:320).

Since the mutual recognition in question, that is, the sway of the "rule of right," can be shown to be possible only within a free society, Fichte's examination of "natural right" quickly turns into a consideration, deeply indebted to Rousseau, of the nature of a just social order, the sources of political legitimacy, and some of the specific features of a "just state." Indeed, the *Foundations of Natural Right* could be described as a systematic effort to re-establish the *Social Contract* on purely transcendental foundations. It is the most important early presentation of Fichte's political philosophy.

From a purely systematic perspective, the most distinctive feature of Fichte's *Rechtslehre* is his clear awareness of the distinctively "mixed" character of such a discipline. It is "theoretical," because it speaks of a "world" (viz., the juridical or political order which is designed to constrain the activities of freely self-positing individuals in such a way that each can pursue their own goals); yet it is also "practical," because such a world is never simply "given" to us, but must be produced by free action. The just state is a human product, not something "natural"; but at the same time it is something *external,* something which, unlike purely ethical ends, cannot be achieved merely by internal self-limitation—though, to be sure, the "external limitations" required by the concept of "right" must be freely self-imposed (i.e. must be expressions of the "general will").

This is precisely what distinguishes the "science of right" from the "theory of ethics" (and distinguishes Fichte's treatment of the former from that of Kant, for whom the "theory of right" constitutes a subdivision of ethics): whereas ethics deals with the sphere of our duties, and thus with what is *demanded* of us as free individuals, the theory of natural right deals with those limitations of freedom which are required by the concept of a community of free individuals; i.e. it deals with what is *permitted*. Whereas ethics is concerned with the inner world of conscience, the theory of right is concerned only with the external, public realm—though only insofar as the latter can be viewed as an embodiment of freedom. Hence the concept of right obtains its binding force, not from the ethical law, but rather from the general laws of thinking and from enlightened self-interest. Such a force is hypothetical rather than categorical. If one is to posit one's own freedom, then one must posit the freedom of others and limit one's own freedom accordingly. It follows that a just political order is a demand of reason itself, since "the concept of justice or right is a condition of self-consciousness" (I, 3:358).

The other subdivision of the theory of the postulates, that is, the philosophy of religion, is described as that philosophical science which concerns itself with the postulates which morality addresses to nature. As such, the philosophy of religion considers the manner in which the sensible realm of nature is supposed somehow to accommodate itself to the goal of morality, and thus it deals primarily with what is sometimes called the problem of "divine providence." Fichte himself, as we have noted, was prevented from fully developing this portion of his system while at Jena by, ironically enough, the outbreak of the atheism controversy. Nevertheless, one can gain some idea of his thoughts on this subject from the short essay, "On the Foundation of Our Belief in a Divine Government of the Universe," which precipitated the controversy in question. What one finds in this essay is, first of all, an attempt to draw a sharp distinction between religion and philosophy (corresponding to the all-important distinction between the "ordinary" and "transcendental" standpoints), and second, a defense of our right to postulate something like a "moral world order." But whereas Fichte argues that we are justified in believing that our conscientious actions will in fact "make a difference" in the real world, he resolutely insists (against the Kantians) that such a postulate does not require the postulate of a personal deity, a.k.a., "moral lawgiver." Thus the argument of the essay in question is primarily negative. It does not deny the existence of God, but it does deny that such a postulate is morally required or justified.

Finally, a word is perhaps in order concerning the general tenor or "spirit" of Fichte's Jena *Wissenschaftslehre*. Before finally settling upon a distinctive name for his new philosophy, Fichte considered various

possibilities, one of which was *Strebungsphilosophie,* or "philosophy of striving" (II, 3:265). As a description of "the first system of human freedom" this discarded appellation is particularly apt, for the general conclusion of the Jena *Wissenschaftslehre* is as follows: Freedom is possible and actual only within the context of natural necessity, where it is never "absolute," but always limited and finite. Though it must posit its freedom "absolutely"—that is to say, "purely and simply" *(schlechthin)* or "for no reason"—a genuinely free agent can actually exist only as a finite individual striving to overcome its own limitations and to transform the natural world in accordance with its own goal concepts. To be an "I" is thus to be involved in an endless process of self-overcoming, a process which necessarily takes place in reciprocal interaction with other self-overcoming agents and in the context of a spatio-temporal, material world. Without such limits, there can be neither freedom nor self-consciousness.

Such is the philosophical "vision" which presides over and gives direction to the often bewildering complexities of Fichte's Jena writings. The *Wissenschaftslehre* is a philosophy of projects, a "philosophy of the future." The famous "absolute I" with which the system begins is a mere abstraction, just as the final unity of the I with itself toward which it aspires is a sheer ideal. Between the abstraction and the ideal lies the entire realm of actual consciousness and experience, which, as we have seen, is necessarily a realm of finite, constrained freedom and of real, empirical nature, which exists only "for consciousness"—even though the specific determinacy of this natural world remains philosophically inexplicable. What we *can* grasp is that the world is not now as it ought to be and that it is up to us to change it. Hence Fichte's parting injunction to the students who flocked to his lectures during his first semester at Jena: "Act! Act! That is what we are here for" (I, 3:67).

SCHELLING'S *NATURPHILOSOPHIE* AND SYSTEM OF IDENTITY

Even in a period when observers were in the habit of keeping a weather eye on the philosophical horizon for the emergence of the newest star, Friedrich Wilhelm Joseph Schelling was a phenomenon: a philosophical *Wunderkind* who lived a long life, marked by what at least appeared to be dramatic and frequent shifts of philosophical orientation. Accordingly, it is customary to divide Schelling's philosophical career into a number of more or less distinct phases or periods, though scholars disagree among themselves over the precise number of periods and the degree of

underlying continuity in Schelling's development. Here, in any case, we will confine our attention to the period prior to his departure from Jena in 1803.

Born near Stuttgart in 1775, Schelling was the son of a Schwabian pastor and duly attended the seminary at Tübingen, where he became close friends with Hölderlin and Hegel. His first philosophical publication, an essay on "the philosophy of mythology," appeared in 1793, when its author was barely 18 years old. With the publication of Fichte's first systematic writings, Schelling immediately became an enthusiastic exponent of the same and devoted his next two publications, *On the Possibility of a Form for All Philosophy* (1794) and *On the I as the Principle of Philosophy* (1795), to expounding and defending this latest version of transcendental idealism.

After leaving Tübingen in 1795, Schelling spent three years as a tutor to the children of a wealthy nobleman, a post which provided him ample opportunity for travel and independent study (including an extended period during which he studied physics, medicine, and mathematics at the University of Leipzig). During these years he became a regular contributor to the *Philosophical Journal,* where he published his *Philosophical Letters on Dogmatism and Criticism* (1795), as well as his *New Deduction of Natural Right* (1796)

A growing enthusiasm for Spinoza began to become increasingly evident in Schelling's writings of this period, along with mounting reservations concerning the *Wissenschaftslehre*. Above all, Schelling was dissatisfied with the status assigned to "nature" by Fichte's system. Indeed, one could characterize Schelling's philosophical project at this point as an attempt to replace Fichte's "lifeless" conception of nature with a more adequate one modeled on Spinoza's notion of *natura naturans,* but to do so without overstepping the bounds of transcendental idealism (e.g. by assimilating Spinoza's "infinite substance" or God to the idealists' "transcendental I").

Stimulated both by his enthusiasm for Spinoza and by his own scientific studies, Schelling gradually became preoccupied by efforts to construct a systematic *Naturphilosophie* or "philosophy of nature." To be sure, he was not alone. Others, for example Goethe, were also vocal in their dissatisfaction with what they regarded as the unnecessarily mechanistic and reductive character of the Newtonian worldview. Nevertheless, Schelling gave a distinctive twist to this project, inasmuch as he attempted to develop a more holistic view of nature which would at the same time be at least compatible with (if not actually a systematic subdivision of) the new transcendental philosophy of Kant and Fichte. Of his many publications on this topic, the more important include *Ideas for a Philosophy of Nature* (1797) and *On the World-Soul* (1798), as well as the *Journal of Speculative Physics* (1800–3).

In 1798 Schelling received an academic appointment at Jena, where he remained until 1803. Though he had frequent contact with Fichte during his first year in Jena, he was even more intimately associated with a younger and more artistically inclined circle, which included the Schlegel brothers, Tieck, and Novalis. Indeed, his philosophy of this period exercised a seminal influence upon the birth of "German romanticism," just as the latter, in turn, deeply influenced the subsequent development of Schelling's own thinking.

Even as he was exploring "speculative physics" and attempting to supplement transcendental idealism with *Naturphilosophie,* Schelling was also engaged in an attempt to construct a revised and improved presentation of transcendental idealism itself. His lectures on this subject resulted, in 1800, in the publication of what is perhaps, from both a literary and a philosophical point of view, his most successful single publication, *The System of Transcendental Idealism*.

Because of the quite privileged status assigned to an at the conclusion of the latter work, this phase of Schelling's thought is sometimes characterized as "aesthetic idealism." But Schelling's interest in an was not a merely passing phase, nor was it purely theoretical in character. Just as he had previously supplemented his efforts to construct a *Naturphilosophie* by studying the empirical sciences, so too, under the tutelage of Friedrich Schlegel, he attempted to cultivate himself aesthetically by making a systematic, empirical study of the history of an. The fruits of this intensive effort are apparent in the richly detailed lectures on the philosophy of art he delivered first at Jena (1801–3) and then at Würzburg (1803–4).

Schelling's Jena philosophy culminates in his efforts, in the years immediately following the publication of his *System of Transcendental Idealism,* to make explicit the implicit harmony between the philosophy of nature and transcendental idealism. In order to accomplish this goal, he incorporated both of these "sciences" within a larger, more encompassing system, which he dubbed the "System of Identity" or "Absolute Idealism" and expounded in a series of publications, including the *Presentation of my System of Philosophy* (1801), *Bruno, or On the Natural and the Divine Principle of Things* (1802), and what is unquestionably the most accessible and "popular" presentation of this phase of his thought, *On University Studies*.

This was also the period of close and regular collaboration between Scheliing and Hegel, who arrived in Jena in 1801. For the next two years the two were allied in a collaborative effort to explicate and to defend the new System of Identity. In pursuit of this goal, they founded and co-wrote the entire contents of a short-lived new *Critical Journal of Philosophy*. During this same period the rift between Schelling and Fichte—a rift

which originally arose over Fichte's misgivings at Schelling's efforts to "supplement" transcendental philosophy with *Naturphilosophie* and then turned into a more general disagreement concerning the nature and limits of philosophy itself—became permanent and public.

In 1803 Schelling, accompanied by his new wife Caroline (ex-wife of A.W.Schlegel), left Jena for a chair at the University of Würzburg, which had only recently come under the protection of the Bavarian Crown. In 1806 Schelling moved to Munich, where he served as general secretary of the Academy of Fine Art and delivered occasional public lectures as a member of the Bavarian Academy of Science. Later, following the establishment of the University of Munich, Schelling was appointed to a professorship. As a Protestant in a Catholic state increasingly dominated by ultramontane forces, Schelling found himself under growing pressure, but he nevertheless remained in Munich until his move to Berlin in 1841 (except for the period from 1820 to 1827, which he spent as a professor at the Protestant University of Erlangen).

For the next several years Schelling continued to develop and to defend his System of Identity (see e.g. his *System of Philosophy as a Whole and of the Philosophy of Nature in Particular,* 1804), while continuing to cultivate his interests in the philosophy of art (see e.g. *Concerning the Relationship of the Plastic Arts to Nature,* 1807) and *Naturphilosophie* (establishing yet another new journal, the *Yearbook for Medicine as Science,* 1805–8). However, the most distinctive feature of Schelling's thought during this period was a growing concern with religious issues and a particular fascination with the Gnostic tradition, as embodied, for example, in the theosophical writing of Jakob Boehme. This new interest is reflected in all of Schelling's post-Jena writings, and is especially prominent in his well-known *Philosophical Inquiries into the Nature of Human Freedom* (1809).

Eventually, Schelling's public forays into religious issues embroiled him in a bitter public controversy with Jacobi. At roughly the same time he also broke with his erstwhile ally Hegel, who, without mentioning Schelling by name, had mercilessly lampooned the System of Identity in the Preface to his *Phenomenology of Spirit*. Following the death of Caroline in 1809, Schelling's activity as a philosophical author virtually ceased. He began to associate more and more with conservative social and religious elements, defended the reactionary alliance of "throne and altar" represented by the Karlsbad decrees, and proudly identified himself as an opponent of "old-Jacobin views and of shallow Enlightenment."

From 1811 to 1813 Schelling worked on an ambitious speculative interpretation of human history, *The Ages of the World*. He went so far as to have text set in type, but withdrew it from publication at the last moment. He also began to lecture on the history of philosophy, and his

lectures on this subject reveal an extraordinary animus against his erstwhile philosophical allies and a special resentment toward the growing success of Hegel's dialectical idealism. More and more, however, his lectures and writings focused upon the same three subjects: art, mythology, and religion.

In 1841 Schelling relocated to Berlin, where he was appointed Privy Councilor to the court as well as Professor of Philosophy, charged with the task of stamping out the "dragon's seed of Hegelianism." To the disappointment of the civil authorities, as well as that of his auditors (whose ranks included Kierkegaard, Bakunin, and Engels), Schelling barely touched upon political and social philosophy in his lectures at Berlin. Instead, he devoted them almost entirely to the development of his new philosophy of revelation and methodology. By this point he had begun to characterize his new standpoint as "positive philosophy," in contradistinction to the purely "negative" philosophy of Kant, Fichte, and Hegel—as well as of his own Jena period. Increasingly isolated from his students and contemporaries, Schelling finally died in 1854 in Bad Ragaz in Switzerland, where he had gone to recover from a cold.

It is difficult to comment briefly upon the thought of a philosopher whose intellectual development went through as many apparent "shifts" and phases as Schelling's. Nevertheless, some brief description of Schelling's philosophical itinerary prior to 1804 is called for, beginning with his first, self-consciously "Fichtean" phase. First of all, there is some question concerning the extent to which Schelling was ever an orthodox follower of Fichte, since important differences between his views and Fichte's are apparent even in his earlier writings. In hindsight, anyway, most scholars would agree with Schelling's own judgment of 1807, that "there was certainly a time when I sought to find something higher and deeper in [Fichte's] philosophy than I could in fact find there" (7:23).[2] Still, the differences are hardly overwhelming, and it is hard to blame the young Schelling's contemporaries for initially classifying him as little more than "the town-crier of the I."

In retrospect, of course, one can detect the seeds of future development in Schelling's reluctance to endorse Fichte's view of the I as a pure activity and in his insistence, already apparent in *On the I,* on talking about the "being" of the I, and the various "spiritual properties" of the same. As has already been mentioned, however, the most striking difference between Schelling and Fichte at this point concerned the status of "nature"—both within transcendental philosophy itself and as an object of a special philosophical science.

The growing differences between Schelling and Fichte are even more apparent in the former's *Philosophical Letters on Dogmatism and Criticism,* in which the system of Spinoza ("dogmatism") is compared to

that of Fichte ("criticism"), ostensibly to the advantage of the latter. Even here, however, it is apparent that Schelling's deeper interest is not so much to demonstrate the incommensurability of these rival systems as it is to find some way of combining Spinoza's superior grasp of objective reality with Fichte's transcendental analysis of subjective freedom.

Another significant difference between Schelling and Fichte, even at this early date, is hinted at in the former's casual reference to an "intellectual intuition of the world" (I:285). Whereas for Fichte, "intellectual intuition" designated the abstractly conceived "self-positing" of the I, Schelling was prepared to employ this same term in a much broader sense to designate an allegedly "higher," non-sensible type of "direct perception" of objective reality, so that one could speak of an intellectual intuition of the Not-I as well as of the I. Understood in this manner, "intellectual intuition" was transformed into a special "faculty of truth" possessed by at least some individual human beings. It is this sense of "intellectual intuition" which attracted the attention of Novalis and Friedrich Schlegel and finally led Schelling himself to assert that "art is the organ of philosophy."

Schelling's dissatisfaction with the purely formal or "negative" concept of nature defended by Fichte, together with his admiration for Spinoza's interpretation of nature as a self-developing whole *(natura naturans)* soon led Schelling to make his first truly independent contributions to philosophy. Initially, this took the form of an effort to *supplement* transcendental idealism, which attempts to derive our knowledge of objects from an initial act of self-positing, with a "philosophy of nature" or *Naturphilosophie* that attempts just the opposite: i.e. the derivation of consciousness from objects. *Naturphilosophie* begins with nature as "pure objectivity" and then shows how nature undergoes a process of unconscious self-development, culminating in the production of the conditions for its own self-representation, that is, in the, emergence of mind of spirit. *Naturphilosophie* thus shows how subjectivity emerges from pure objectivity. As precedents for this way of viewing nature, Schelling could refer, not only to Spinoza and Goethe, but also to Kant. Not only are features of Schelling's view of nature anticipated in Kant's discussion (in the *Critique of Judgment*) of natural teleology, but Kant had also attempted (in his *Metaphysical Foundations of Natural Science*) to develop a "metaphysico-dynamical" theory of matter as an equilibrium of opposed forces. Indeed, Schelling called explicit attention to the parallels between Kant's theory of matter and his own, though he noted that the "positive elements" in Kant's theory "remained too subordinate" (5:332).

Rather than viewing nature merely as the "other" of consciousness, Schelling's *Naturphilosophie* seeks to interpret it as an analogon of the same: to treat nature as "visible spirit" and spirit as "invisible nature" (2:56). So viewed, nature no longer appears to be the mechanically

ordered, lifeless realm of the Not-I; instead, it becomes a living, self-organizing system in its own right, one not of mechanical relations between material "things," but of dynamic relations between forces, a self-developing, organic whole, containing within itself its own end or purpose: viz., the production of ever higher natural forms, culminating in mind itself.

In contrast with the approach of the experimental sciences, the method of *Naturphilosophie* is fundamentally *a priori*. It begins with the concept of the *unity* of nature *(natura naturans)* and then deals with the *diversity* of the same *(natura naturata)* by interpreting nature as a *system* of opposed forces or "polarities." The task of *Naturpbilosophie* or "speculative physics" is to describe this system, from its highest, self-organizing principle ("the world soul") to the various specific oppositions or "polarities" (e.g. attraction and repulsion, positive and negative forces, light and darkness), which manifest themselves in ever more complex levels of organization, referred to by Schelling as "powers" or "potencies" *(Potenzen)*. At the first level or "power," nature appears as a system of independent physical bodies; at the second, it is a realm of dynamic processes; whereas at the third and highest level it appears as a completely organic realm, indeed, as a single "organism." This hierarchical scheme reflects the teleological character of nature itself, inasmuch as the lower levels of organization can be adequately "explained" only in terms of the higher.

Whereas Schelling, in the first edition of his *Ideas for a Philosophy of Nature,* still sought to provide something resembling a 'transcendental deduction" of the "idea of nature," he dispensed entirely with such a derivation in the second edition (1803). In the new System of Identity the duality between nature and spirit proceeds directly from the point of "absolute indifference" with which the system begins; and thus the requisite concept of nature is immediately available for philosophical analysis.

In fact, the very idea of a *Naturphilosophie* was based from the start upon the idea of the "Absolute" (not to be confused with the "absolute I" of transcendental philosophy), an idea which can be warranted neither on empirical nor on transcendental grounds. Instead, as in Spinoza and in Schelling's own System of Identity, the idea of the Absolute must simply be asserted as the philosophical starting point. Hence, by 1801 at the latest, Schelling had come to the clear recognition that the philosophy of nature is not an autonomous, self-grounded science, but "can proceed from nothing but a system of identity" (5:116).

As has been emphasized, Schellmg never considered his interest in the philosophy of nature to be in any way incompatible with his commitment to transcendental idealism. Instead, he viewed the two as complementary,

as two sides of the same coin and two branches of a single, more comprehensive system, which he eventually names the "System of Identity." Before commenting upon the latter, however, let us consider a few of the more distinctive features of Schelling's own essay into transcendental philosophy in his *System of Transcendental Idealism*.

Whereas *Naturphilosophie* traverses the path from sheer objectivity to subjectivity, transcendental idealism proceeds in the diametrically opposed direction: pure subjectivity (self-consciousness) to objectivity (the necessary positing of the Not-I, or nature). This latter path, of course, was already blazed by the *Wissenschaftslehre,* and Schelling's description of it resembles Fichte's in many of its details. Adapting Fichte's characterization of transcendental philosophy as a "pragmatic history" of the human mind, Schelling's presentation of transcendental idealism takes the form of an analysis of successive "epochs" of consciousness; hence it moves from "sensation" to "sensible intuition," from "intuition" to "reflection," and from "reflection" to "willing." At the same time, Schelling also attempts to indicate how each of these stages in the transcendental "history" of self-consciousness is correlated with a specific *Potenz* of nature itself.

After having derived "willing," Schelling turns to what is (at least in comparison with Fichte's treatments of these topics) a rather perfunctory account of the "practical" portion of transcendental idealism, that is, to a deduction of intersubjectivity, the categorical imperative, the system of moral duties, and finally, the system of rights or laws. An innovation in Schelling's account of "natural right" and the just state is his explicit attention to the temporal, that is to say, historical, evolution of a just social order. Thus the *System of Transcendental Idealism* presents us, almost in passing, with an interpretation of human history as a process of *endless progress* toward the full realization of freedom, and thus as a "continual and gradual self-revelation of the absolute" (3:603). Schelling's remarkable suggestion that history bears the same relation to practical philosophy that nature bears to theoretical philosophy implies that Fichte overlooked one of the "real sciences" which should constitute a separate subdivision of any complete transcendental system, viz., philosophy of history.

By far the most innovative and influential portion of Schelling's *System of Transcendental Idealism,* however, is its concluding section, "Deduction of the Universal Organ of Philosophy, or, Essentials of the Philosophy of Art according to Transcendental Idealism." Here Schelling treats art, not merely as capable of providing us with an "as if" glimpse of noumenal reality (Kant), nor as capable of assisting in the transition from the ordinary to the transcendental standpoint (Fichte), but rather as accomplishing—albeit in a concrete rather than in an abstract form—the very task of transcendental idealism. It is precisely within aesthetic

experience, according to Schelling, that the identity between the subjective and the objective, what is conscious (freedom) and what is unconscious (nature), becomes an *object* to the experiencing I itself. This unity is present in the *art product,* the "beauty" of which is explicable only as a finite display of the infinite. The art product, in turn, can achieve this synthesis only because of the distinctive character of the activity which produces it. Artistic production, unlike all other human activities, is simultaneously free and unfree, conscious and unconscious.

Rather than attempting to explicate further the distinctive character of artistic production, Schelling simply invokes at this point "the obscure concept of 'genius'," (3:616). Thus he was led by the force of his own argument to the conclusion that it is here and only here—in the productive activity of the artistic genius, in the "art product" which results from this activity, and finally, in the secondary type of "genius" required for genuine aesthetic appreciation—that the fundamental insight of transcendental idealism (viz., the identity of the ideal and the real) becomes apparent *within empirical consciousness*. This, therefore, is the meaning of the oft-quoted claim that art is "the only true and eternal organ and document of philosophy" (3:627), for it is within aesthetic experience—and there alone—that the philosopher encounters in an objective form that intuition which allegedly grounds their entire transcendental system. By appealing to (objective) aesthetic intuition, the transcendental philosopher can defend him- or herself from the charge that the "intellectual intuition" with which they begin is nothing but a subjective illusion.

With this typically bold move, Schelling elevated the philosophy of art or aesthetics into a central position within his overall system. In fact, it could be argued that the "philosophy of art" outlined by Schelling during this period (1800–4) should really be viewed as constituting a third, co-equal branch of his overall System of Identity, one which should take its rightful place alongside *Naturphilosophie* and transcendental idealism. If, as Schelling maintains, art is "a necessary appearance which flows directly from the Absolute" (5:345), then art, nature, and spirit are merely three different expressions or manifestations of the underlying reality.

In the years following the publication of the *System of Transcendental Idealism* the philosophy of art sketched at the conclusion of that work was elaborated by Schelling along Platonic (or Neo-platonic) lines. Thus, in his *Bruno,* as in his lectures on *The Philosophy of Art,* he interprets individual works of art as participating in or reflecting the various divine "Ideas." No aspect of Schelling's philosophy exercised a greater influence upon his contemporaries than his remarks on art, which fell on fertile ground and were further developed into what amounted to a religion of art by the early German romantics. Schelling himself, however, was never guilty of trying to supplant philosophy with art (even though he may have come

perilously close to this at the conclusion of his *System of Transcendental Idealism,* where he calls for a "new mythology" which will represent the triumphant return of science to poetry and the synthesis of both). Instead, he insisted that art and philosophy should be viewed as correlative: art as the *real* and philosophy as the *ideal* reflection of one and the same absolute reality. What is present to the philosopher as a "subjective reflection" is present to the artist as an "objective reality"; but for this very reason the artist, who is inspired by a "genius" he himself does not clearly comprehend, remains unconscious of the true and "absolute" nature of his or her object, whereas the philosopher can acquire genuine "knowledge" of the identity in question. "This is why philosophy, despite its inner identity with art, remains always and necessarily science—i.e. ideal—and art remains always and necessarily art—i.e. real" (5:349).

If transcendental idealism traces the path from "the ideal" to "the real" and *Naturphilosophie* the path from "the real" to "the ideal," and if it is also true that the basic presupposition underlying all true science is "the essential unity of the unconditionally real and the unconditionally ideal," a unity which is identical to "the idea of the Absolute" (5:216), then surely it behooves the systematic philosopher to make this underlying unity as explicit as possible. This is precisely the task of Schelling's "System of Identity": to give philosophical substance to his frequently repeated assurance that transcendental idealism and *Naturphilosophie* are mutually complementary. Since this new system recognizes the total interpenetration of the real and the ideal at every level, Schelling called it "objective" or "absolute idealism" (5:112). Since it asserts the underlying identity of mind and nature, as well as of all other experienced differences (including the philosophical differences between the systems of Spinoza and Fichte), he also called it the "System of Identity."

The most distinctive feature of this new system is that it *begins* with a bald assertion of the unity of thought and being, that is, with the idea of the "Absolute" or "reason." As Schelling explains, "this is the idea of the Absolute: viz., that in relation to the absolute, the idea is also being, and thus the absolute is also the first presupposition of knowing and is itself the first knowledge" (5:216). Consequently, it is futile to demand any sort of philosophical deduction of or justification for the idea of Absolute Identity. Instead, the unity expressed by this idea must simply be presupposed.

The System of Identity commences not with the transcendental idealist's principle of self-identity, but with the still broader principle of identity as such, an identity which transcends and comprises every conceivable difference (hence Schelling's description of his own starting point as the "point of indifference"). To express this bare logical idea of an identity underlying every difference, Schelling utilized the abstract formula "A=A,"

which he consequently characterized as expressing "the supreme law of reason." From this undifferentiated or "indifferent" starting point, he then proceeded to a description (albeit a remarkably abstract one) of reality as a whole, considered as a differentiated system within which unity is maintained by various synthetic relationships, such as substance and attribute, cause and effect, attraction and repulsion, etc. As in his philosophy of nature, Schelling's System of Identity utilizes the notion of various hierarchically related *Potenzen* as its basic organizing principle. For since, as Schelling notes, there is only *one* absolute and identical reality, it follows that "diversity among things is possible only to the extent that the undivided whole is posited under various determinations [or 'powers']" (5:366).

It must be confessed that, for all of Schelling's dialectical ingenuity, the details of his exposition of this system remain extraordinarily obscure. Though this is especially true of his attempts at a systematic presentation modeled on Spinoza's *Ethics* (e.g. in the *Presentation of my System of Philosophy*), it is also true of the "conversational" presentation contained in the dialogue *Bruno,* as well as of the informal exposition contained in the first of his lectures *On University Studies*. However, few critics of Schelling's System of Identity even bother to examine the details of his exposition and most limit themselves to pointing out the alleged emptiness or incoherence of the first principle of the same. Generations of students and scholars have been content to echo Hegel's famous characterization of Schelling's Absolute as "the night in which all cows are black."

However, even if one overlooks the difficulty of grasping its abstract starting point, the System of Identity still suffers from an even more serious problem, viz., its inability to give an adequate explanation of the *why* and the *how* of the initial movement from the point of indifference or identity to a (real) system of differentiated elements. The difficulty in question concerns the relationship between the "indifferent absolute" and everything else (and indeed, the very intelligibility of positing anything "else" beyond or outside of the "Absolute"). How, precisely, is one to understand the transition, demanded by this philosophy, from unity to difference, from the one to the many, from the eternal to the temporal, from the infinite to the finite, from the abstract to the concrete, from form to content, etc.? Schelling himself was clearly dissatisfied with his own solution to these questions, though not with the questions themselves; indeed, they may be said to have set the agenda for his entire subsequent philosophical development.

The more one reflects upon the problem of the transition from the Absolute to its finite manifestations, the easier it is to see why, in the period immediately after his departure from Jena, Schelling was increasingly attracted to various forms of Platonism and Neo-platonism

and was particularly fascinated by the works of Bruno and Boehme; for all of these preceding philosophies explicitly address the question of how the finite can be said to "proceed from" the infinite. Furthermore, all of them tend to interpret the former merely as an "appearance of" or "way of looking at" the latter—albeit a necessary one.

Ultimately, Schelling seems to have acknowledged the intractability of this problem, at least within the framework of his earlier philosophy. Indeed, beginning with his *Philosophical Inquiries into the Nature of Human Freedom,* all of his later works may be seen as attempts to resolve this very problem, and to do so by moving from a purely abstract or formal philosophy of logical relations—a "negative" philosophy incapable of addressing questions of "existence"—to a "positive" philosophy, better able to open itself to the mystery of existence.

If Fichte's philosophy may be called a "philosophy of striving," Schelling's may be characterized as a philosophy of speculative salvation, inspired, above all, by a deep longing to restore a presumably lost unity or harmony. This longing is expressed in the profoundly "metaphysical" character of all of Schelling's writings, including his earliest ones. As early as 1795, he characterized philosophy's task as "solving the problem of the existence of the world" (I:314), a formulation which certainly betrays a radically different spirit from that expressed in Fichte's description of philosophy's task as "explaining the origin of representations accompanied by a feeling of necessity," though not inconsistent with it.

It is quite in keeping with this difference that Schelling should have soon discarded the strictly transcendental approach to philosophy and should have transformed his system into a doctrine of the Absolute, for only such a doctrine is capable of addressing the "riddle of existence." A genuinely Critical or transcendental philosophy, in contrast, while not denying the presence of such a "riddle" within human life, also acknowledges philosophy's utter inability to solve it.

But the differences between Schelling and Fichte extend beyond their disagreement concerning the limits of philosophy, and include—if indeed they are not based upon—a disagreement concerning the very aim of human life. In Fichte's view, consciousness is necessarily divided against itself and the world; freedom is expressed through practical striving; and harmonious self-identity remains an unobtainable ideal. For Schelling, on the other hand, unity is always present, however obscured by appearances; all that prevents us from acknowledging this, and thereby obtaining a kind of salvation, is our lack of knowledge.

Moreover, according to Schelling, philosophy itself—that is, a misguided philosophy of "mere reflection"—is largely responsible for our present, torn condition, our separation from nature and from our own true selves. We suffer from a "spiritual sickness"; we long for restoration

of a "lost unity." But the way to recover our health and restore this unity is not to reject philosophy, but to replace a shallow and false philosophy with a profound and true one: "to abolish the split at a higher power by means of speculation" (5:121).

In the end, there is no better way to characterize the "presiding spirit" of Schelling's thought than to contrast it with that of Fichte's, and this contrast is nowhere better expressed than by Schelling himself, in his first lecture *On University Studies*, where he wrote, in a transparent allusion to Fichte: "'Action! Action!' is the call that resounds from many quarters, most loudly however from those who do not wish to proceed with knowledge" (5:452) Though Schelling undoubtedly included himself among the ranks of the latter, he never considered knowledge to be an end in itself, but only a means: a means for overcoming our divided selves, a means toward salvation. It is no accident that, whereas Fichte's most original philosophical contributions were to ethics and social philosophy, Schelling's were to the philosophy of art and philosophy of religion.

THE LATER PHILOSOPHIES OF FICHTE AND SCHELLING

Even the most casual reader must be struck by the obvious superficial differences between the many versions of the *Wissenschaftslehre* Fichte wrote after 1800 and the two presentations of the "foundations" of the same he produced while in Jena. Experts continue to differ among themselves, however, concerning the depth and significance of the differences in question, with some arguing for a radical break in Fichte's intellectual development after the move to Berlin and others emphasizing the continuity of his writings and the similarities between the systems of his Jena and Berlin periods. (Fichte himself never renounced his earlier writings nor did he emphasize the differences between the various versions of the *Wissenschaftslehre;* on the contrary, he tended to describe them simply as so many different expressions or presentations of one and the same "spirit.")

So too in the case of Schelling, though here the differences are, if anything, even more striking (and of course Schelling himself called explicit attention to the differences between his earlier, "negative" philosophy and the "positive" philosophy of his Berlin years). Nevertheless, there are distinguished scholars who attempt to emphasize the continuity of Schelling's intellectual development and scorn the traditional division of his works into a series of separate "periods." Still,

no reader of the *Philosophical Inquiries into the Nature of Human Freedom* or the posthumously published Berlin lectures on *Philosophy of Mythology* and *Philosophy of Revelations* can fail to note the tremen-dous difference between these works and the writings of Schelling's Jena period.

Moreover, even those scholars who acknowledge the fundamental differences between Fichte's earlier and later works, or between Schelling's earlier and later writings, disagree concerning the causes or reasons for these differences. Whereas some emphasize the role of "external" factors (such as, in the case of Fichte, the atheism controversy, the dispute with Jacobi, and the French occupation of Prussia, or, in the case of Schelling, the influence of figures such as Franz von Baader, Schelling's resentment at the successes of his contemporaries, and the general reactionary mood which engulfed Europe in the wake of the Congress of Vienna), others point to internal, philosophical reasons for the specific changes they purport to find in Fichte's and Schelling's post-Jena writings.

It has been said of Fichte that whereas his earlier thought and writings belong to the history of philosophy, his later work—with the exception of such "popular" efforts as *The Way toward the Blessed Life* and the *Addresses to the German Nation*—are of purely biographical interest, and the same could be said of the works of Schelling's final period. The point of such observations, presumably, is to call attention to the greater influence the early writings of each man had upon the subsequent history of "German Idealism." This, of course, is hardly surprising, given the fact that the most important theoretical writings of both Fichte's and Schelling's later years were not published until years after their deaths. However, this fact alone should not be allowed to suggest that the later writings of either are somehow lacking in intrinsic, philosophical merit. On the contrary, it is precisely the later, posthumously published writings of both Fichte and Schelling which have received the most concentrated attention from recent and contemporary scholars.

Large claims have been made on behalf of the later versions of Fichte's philosophy, and especially concerning the 1804 *Wissenschaftslehre* (which replaces the first principle of the Jena versions—viz., "the I simply posits itself"—with the lapidary proposition, "there is truth"). So too, far more attention has been paid in recent decades to Schelling's post-1803 writings than to his earlier works. In particular, his 1809 *Philosophical Inquiries into the Nature of Human Freedom* has been the subject of studies by such eminent thinkers as Karl Jaspers, Paul Tillich, and Martin Heidegger, all of whom agree in interpreting this text as a harbinger of twentieth-century existentialism. Other scholars have pointed to the lectures Schelling delivered during his final Berlin years as representing, not merely the logical conclusion of his own protracted philosophical development, but the culmination of German Idealism as a whole. Consequently, no well-

informed contemporary student of either Fichte or Schelling would be likely to dismiss the later writings of either as lacking in interest or value.

Nevertheless, from the standpoint of a "history of German Idealism" it remains true that the Jena writings of Fichte and Schelling are the ones that matter most. They are the ones upon which their contemporary reputations were largely based, just as they are the writings which most influenced the immediately subsequent history of philosophy (unlike the later works, which exercised a negligible influence upon the "history of German Idealism"). To take a particular case in point, Hegel's philosophy, at least in the form in which we are familiar with it, is quite inconceivable apart from Fichte's Jena *Wissenschaftslehre* and Schelling's *Naturphilosophie* and System of Identity.

Hence there is some justification in the present context for ignoring the later published and unpublished writings of Fichte and Schelling. This, however, should not be taken as an implicit judgment upon the relative philosophical worth of the earlier and later writings of either Fichte or Schelling, nor is it meant as an endorsement of Hegel's self-serving interpretation of the philosophical merits of Fichte and Schelling, whom he tended to treat as little more than stepping stones toward his own version of speculative idealism. On the contrary, one must strenuously guard against such an interpretation, even if limited to the Jena writings of Fichte and Schelling. To interpret these solely in the light of their reception and critique by Hegel and others is to distort and to misunderstand them, a misunderstanding not unlike the one which would be involved if one were to read Plato merely as forerunner of Aristotle, or Descartes simply as a step along the path to Spinoza.

Quite apart from its historical influence, Fichte's Jena *Wissenschaftslehre* stands on its own as a unique and enduring, albeit widely misunderstood, contribution to philosophy, and the same can be said of Schilling's *System of Transcendental Idealism,* as well as of his various attempts to construct a "philosophy of nature" and to articulate his "System of Identity." Nobody today interprets Kant's *Critiques* merely as an "influence" upon the development of Hegelianism, even though they manifestly were such. So too, it is high time that the early writings of Fichte and Schelling be accorded the same intellectual courtesy—that is, the courtesy of being allowed to stand or to fall on their own merits.

NOTES

1 Fichte's writings and letters are cited, by series, volume, and page number,

according to the text of the (still incomplete) new critical edition: *J.G.Fichte: Gesamtausgabe der Bayerischen Akademie der Wissenschaften,* 24 vols (to date) ed. R.Lauth *et al.* (Stuggart and Bad Cannstatt: Frommann, 1964–. All English translations are by the author (though Fichte's italics have not always been retained).

2 Schelling's writings are cited, by volume and page number, according to the first collected edition, edited by his son, F.K.A.Schelling: *Friedrich Wilhelm Joseph von Schellings sämmtliche Werke,* 14 vols (Stuttgart: Cotta, 1856–61). Translations are by the author.

CHAPTER 6

Hegel's *Phenomenology of Spirit*

Robert C.Solomon

G.W.F.Hegel (1770–1831) was the greatest systematic philosopher of the nineteenth century. As a young man he followed and was (at least at first) enthusiastic about the French Revolution. Then came the Reign of Terror of 1793, and Hegel, like many early followers of the revolution, had second thoughts. With the new century came Napoleon. Hegel and all of Germany watched with mixed fascination, anticipation, and anxiety as Napoleon began his political and military campaign eastward, forming alliances with many of the tiny principalities and city-states of Germany, threatening and swallowing others. By 1806, Napoleon was at the height of his powers, and in the battle of Jena in October of that year, he put an end to the 800-year-old Holy Roman Empire. The international success of French revolutionary liberalism impressed Hegel, who was then teaching at the University of Jena. The battle also put him out of a job. But in the wake of Napoleon Hegel envisioned the birth of a new world, and he announced in the Preface of the book he was completing, albeit in rather ponderous philosophical terms, the ultimate liberation and final unification of the human spirit. The book was called *The Phenomenology of Spirit*. Its influence in philosophy would be as profound and as enduring as Napoleon's bold ventures in European history, in terms of both its positive impact and the reactions it engendered. It is Kant, perhaps, whose "Copernican revolution" is usually compared to the upheaval in France, but it is Hegel who deserves credit for consolidating and spreading that revolution. If Heine could compare Kant to Robespierre, then Hegel, with comparable philosophical hyperbole, deserves comparison to Napoleon.[1]

Hegel began studying and writing philosophy soon after Kant had redefined the philosophical world, and just as Europe was entering the turbulent new century. As a young man, Hegel was educated in the Tübingen seminary but seemed to have little religious ambition or theological talent. In fact, his first philosophical essays were somewhat blasphemous attacks on Christianity, including a piece on "The Life of Jesus" which went out of its way to make Jesus into an ordinary moralist, who in his Sermon on the Mount espoused Kant's categorical imperative.[2] As a student, however, Hegel entertained the idea of inventing a new religion that stressed our unity with nature, a "synthesis of nature and spirit" drawn from the ancient Greeks and crudely formulated with great poetic flair by Hegel's college friend and room-mate Friedrich Hølderlin. Hølderlin was without doubt one of the poetic geniuses of his generation and a powerful influence on young Hegel. Drawing from not only the ancient Greeks but the romantic culture that surrounded them, Hølderlin promulgated a grand metaphor of **effusion,** cosmic spirit making itself known to us and to itself throughout all of nature, in human history, and, most clearly of all, in poetry and the "spiritual sciences." Their younger friend Friedrich Schelling had already converted that metaphor into philosophical currency by 1795, and when Hegel finally decided to turn to serious philosophy in 1801, it was with the encouragement and sponsorship of Schelling. He sought and obtained a teaching position, and, in opposition to the clear polemical tone of his earlier, "anti-theological" essays, he began to write philosophy in a terse, academic style.[3] Hegel joined Schelling in his bold attempt to forge a new form of philosophy, following Kant and the radical neo-Kantian Johann Gottlieb Fichte, and together they published a journal, the *Critical Journal of Philosophy.* His first professional essay was a comparison of the philosophies of Fichte and Schelling, making clear the superiority of the latter.[4] For several years, Hegel was known in the German philosophical world only as a disciple of Schelling. But then he published his *Phenomenology.*[5]

Hegel's original intentions and initial approach to the *Phenomenology* were rather modest and for the most part derivative of earlier efforts by Fichte and Schelling to "complete Kant's system." The idea of a "system" of philosophy comes from Kant, who aspired to provide a unified and all-encompassing "science" of philosophy. But according to Fichte and Schelling and several other philosophers who greatly admired and emulated Kant, he had not succeeded. He left us instead with a fragmentary philosophy which, however stunning in its individual parts, failed to show the unity of human experience. In particular, Kant left a gaping abyss between his theory of knowledge—in the first *Critique,* the *Critique of Pure Reason*—and his conception of morals in the *Critique of Practical Reason,* and so left the human mind as if cleft in two. The third

Critique was supposed to be a synthesis of the two, but in the opinion of many of Kant's closest followers, some of whom preferred the third *Critique* above all, that book failed to provide the synthesis required for a genuine system.[6] Moreover, Kant's conception of the "thing in itself," while central to his philosophy and the key to his division between the phenomenal world of knowledge and the noumenal world of free will, morality, and religion, was greeted by these post-Kantians as a mistake, a serious flaw that threatened to undermine the whole critical enterprise. The idea that there could be any intelligible conception of things as they are in themselves and not as phenomena—that is, as experienced by us—left room for the skeptic to' dig in their wedge with the challenge: How can we know that we really know anything at all? How can we have true or "absolute" knowledge—that is, self-reflective knowledge that does not permit the possibility of skepticism? How does the world of practical reason tie in with what we know, and vice versa? In his philosophy, therefore, Hegel would argue against the intelligibility of skepticism, against the intelligibility of any conception of the "thing in itself" as distinct from things as we know them, and against the bifurcation of human experience into incommensurable theoretical and practical realms. The fact that Hegel expresses this reasonably modest and academically well-established set of problems and their solution in the language of "absolute knowing" has understandably led to much misunderstanding and considerably exaggerated claims on behalf of Hegel's efforts. What Hegel was after, however, was a continuation, a correction, and the "completion" of some of Kant's key themes, die unity of knowledge, the unintelligibility of skepticism, the importance of the first-person, "subjective," Cartesian, or "phenomenological" standpoint as the origin of all knowledge, and the *a priori* necessity of certain forms of consciousness. It was not a particularly ambitious program, and Kant, Fichte, and Schelling, among others, had clearly shown the way.[7]

What emerged in 1807, however, was a book very different from anything that had been seen in philosophy before. True, the Kantian themes and the post-Kantian ambitions were still in evidence, and the book did conclude with a modest chapter entitled "Absolute knowing." But in between the introduction and opening chapters, on the one hand, in which these themes were quickly dispatched, and the brief conclusion, on the other, in which the post-Kantian ambitions were summarily concluded, the book grew into something of a beautiful monster. There are chapters on various Greek philosophies and on various eccentric movements in ethics, as well as an open attack on Kant's categorical imperative, commentaries on contemporary history including the Enlightenment and the French Revolution, bits of literary criticism, philosophy of science, and an oddly shaped survey of the world's religions, all put forward in a barely

intelligible abstract neo-Kantian jargon that makes even the Kantian *Critiques* read like vacation novels by comparison. The *Phenomenology* is not, as originally intended, merely a demonstration of "the Absolute." It is a magnificent conceptual odyssey which carries us through the most elementary conceptions of human awareness to some of the most all-encompassing and complex forms of consciousness. Its stated purpose is still to comprehend the truth—the absolute truth—but this should not be understood as a merely epistemological enterprise. What Hegel comes to mean by philosophical truth is an all-encompassing vision, and this will include not only a variety of philosophical theories but much material from religion, ethics, and history as well.[8]

THE SPIRIT OF THE *PHENOMENOLOGY*

The fact that Hegel so obviously followed in Kant's great footsteps too easily misleads us into thinking that Hegel, supposedly like Kant, was just another academic philosophy professor, worried about abstruse and abstract problems that an ordinary person would neither comprehend nor care about.[9] The truth is, of course, that this picture is unfair to Kant, and it is mistaken about Hegel as well. Kant was moved in philosophy not only by David Hume, who famously awakened him from his dogmatic Leibnizian slumbers, but by his religious piety, his firm moral convictions, and his enthusiasm for Newtonian science. He was troubled by the conflict between science and religion, and he was deeply interested in such speculative questions as the meaning of life as well as the basic Socratic question of what it meant to be a genuinely good human being. To read Kant merely as the answer to skepticism or the grand synthesis of the warring schools of rationalism and empiricism is to miss what is most important and exciting about him. So, too, to see Hegel as the continuation or "completion" of Kant is to deny what is most fascinating about his philosophy. And to read the *Phenomenology* as if it were only a wordy and difficult introduction to the mature "system" that followed is to miss what is most important and exciting about that book. For the "spirit" of the *Phenomenology* is nothing less than an all-embracing conception of the world, an attempt at synthesis, yes, but nothing so meager as a mere collaboration between (as Schopenhauer called them) "irritated professors."

In the Tübingen seminary or *Stift,* Hegel, Schelling, and Hølderlin had dreamed of a new religion.[10] They despised much of their theological training, dismissing it with those familiar vulgarities with which students have always dismissed the dogmatic studies they were forced to mouth

and respect in the classroom.[11] They had deep misgivings about German culture as well, torn between the cosmopolitan clarity and free-thinking of the French and British Enlightenment (represented in Germany by Kant) and the romantic nationalism mixed with mysticism that marked the German romantic reaction to the Enlightenment.[12] The Enlightenment seemed to many Germans to be vulgar, overly concerned with economics, and contemptuous of religion and the "spiritual" aspects of social life.[13] And yet the promises of the Enlightenment seemed so attractive, and the dead weight of feudalism, Lutheran theology, and the medieval church, by comparison, seemed to have philosophy as well as German life pinned down in a decidedly most unenlightened past. Reconciling the cosmopolitan demands of the Enlightenment and their regional pride and piety seemed essential to the young Germans, and the events across the French border made these conflicts very real and very urgent. In the years between his graduation from the seminary and his first university post, Hegel wrote his early essays on the nature of religion.[14] Most of them were hostile to Christianity and held up the spiritual life and the "folk religion" of the ancient Greeks as an attractive alternative.[15] Hegel's early essays were often sarcastic, sometimes clumsy attempts to revise and reconcile Christianity with Greek folk religion, insisting on a "natural" religion rather than one based on authority, and a "subjective" religion—a religion of ritual and social participation—rather than the "objective" religion taught by theology.[16] Religions, Hegel surmised, are and ought to be particular to particular people and a particular time, part of the life of a people and not merely abstract beliefs with no practical manifestations.[17] And yet, it makes sense to speak of "religion" in general, and of certain universal features that all religions and all people share in common.[18]

Hegel here is an evident disciple of Kant. In his *Critique of Practical Reason* and his *Religion within the Limits of Reason Alone,* Kant had insisted on the rational defense of religion and the bond between morality and Christianity.[19] Hegel does find much to criticize in Christian morality, in particular its unworkability in large groups and whole societies. He finds much to criticize in Kant too, notably Kant's neglect of local custom in ethics in favor of universal categorical principles, but he makes it clear nevertheless, in straightforward Kantian terms, that "the aim and essence of all true religion, and our religion included, is human morality."[20] To this end, Hegel tries to revise Christianity as a folk religion concerned first of all with the cultivation of morality, culminating in his awkward but amusing attempt to have Jesus preach the categorical imperative.[21] But as these early unpublished efforts deepen in their thought and their sophistication, Hegel drops much of his hostility and begins to suggest that in all religions one can discern a kind of necessary development of the human spirit.[22] He begins to focus not just on the failings of Christianity

but rather on its internal contradictions, "disharmonies," or "alienations" *(Entfremdungen)*.[23] He finds fault with the idea that God and man are separate and distinct, in which God is infinitely superior and we are mere "slaves."[24] He also finds fault with the distinctions between and separation of reason and the passions, theology and faith, theory and practice. And here we find the seeds of two of the most dramatic and central themes of the *Phenomenology,* the grand conception of Spirit or *Geist* as immanent God incorporating us all, and the all-important place of local customs and affections in ethics. Like so many other thinkers and poets in Germany of the time, Hegel found his inspiration and alternative visions in the fascinating life of the early Greeks. But with the close of the century and the French Revolution in tatters, with German culture in ascendancy and his young friend Schelling already engaged in a very contemporary philosophy that would change the way we think about ourselves, Hegel abandoned his nostalgic posture and moved into the moment. For what he saw happening was just what his youthful essays had been suggesting to him. The world was filled with contradictions and disharmony, but philosophy would make a difference. Only a few years later, ending his lectures at Jena in 1806, the manuscript of the *Phenomenology* in hand, Hegel announced to his classes:

> We find ourselves in an important epoch, in a fermentation, in which Spirit has made a great leap forward, has gone beyond its previous concrete form and acquired a new one.... A new emergence of Spirit is at hand; philosophy must be the first to hail its appearance and recognize it.[25]

The concept of Spirit or *Geist* is clearly the key to Hegel's philosophy. It is important not to translate "*Geist*" as "mind," as some early translators have done, not because it is literally incorrect but because it is extremely misleading. "Spirit" has a religious significance which is missing from "mind," and, more important, "spirit" suggests something larger about a person while "mind" suggests something merely internal and private. We typically speak of the spirit of a group or a nation and "team spirit" as a way of indicating unity and fellow-feeling, and we may also note that "spirit" thus indicates passion, whereas "mind" suggests rather only thoughts and intelligence—not, we should quickly add, that the two are or need be opposed. But what Hegel has in mind by Spirit is nothing less than the ultimate unity of the whole of humanity, and of humanity and the world. It is the concept in which he seeks to synthesize or at least embrace the various contradictions and disharmonies of religion and morality and reconcile humanity and nature, science and religion. Hegel rarely talks about God, but it is quite clear as we trace our way through the labyrinth

of the *Phenomenology* that it is God, God as Spirit, who is our subject and who is our guide. Not a God within, and certainly not a transcendent God without, but the God who ultimately we are emerges from its pages. Thus Hegel's work has often been touted as a "theodicy," an account of God's revelation on earth, and Heinrich Heine, one of Hegel's less pious students, ironically commented: "I was young and proud, and it pleased my vanity when I learned from Hegel that it was not the dear God who lived in heaven that was my God, as my grandmother supposed, but I myself here on earth."[26]

What makes Heine's comment so outrageous, of course, is his mocking usurpation of the role of God himself, but what is essential to Hegel's concept of Spirit is precisely the loss of individuality and the gain in comprehension that it requires. The realization of Spirit is not the recognition that I am myself God but that we are all God, that Spirit pervades and defines all of us. In this, Hegel's notion is much like Spinoza's pantheism, the realization that we are all one, a claim repeated by Schelling and criticized brutally by Hegel in his Preface with the sarcastic comment "the night in which all cows are black."[27] What Hegel is getting at is the necessity to demonstrate his thesis through reason and by way of a lengthy demonstration of its necessity, not by way of mystical experience or dogmatic insistence. And that is what the *Phenomenology* does or tries to do, to demonstrate by actually guiding us through the emergence of Spirit from its various individualistic guises to the recognition of the necessity of larger, more comprehensive forms.

One can understand here the political as well as ontological imagery which pervades Hegel's philosophy. Hegel is not an individualist. In the *Phenomenology* he comments that much less should be thought of and expected of the individual, and in his later *Philosophy of History* he famously tells us that even the greatest individuals follow unwittingly "the cunning of reason" and find themselves pawns in the hands of a larger fate, a dramatic idea that is embodied in flesh and blood by Tolstoy in his later account of Napoleon's Russian campaign in *War and Peace*. One can imagine Hegel envisioning the great battles of that war, in which hundreds of thousands of undifferentiated "individuals" in identical uniforms moved in waves and slaughtered one another for the sake of larger and dimly understood ideas and loyalties. So viewed, the individual does indeed count for very little, and it is the larger movement of humankind that comes into focus instead. And yet, Hegel is no fascist—whatever ideas or inspiration Mussolini and his kind may have drawn from him. Hegel insists on this larger view of human history but nevertheless insists throughout his work that the ultimate aim and result of that history has been human freedom and respect for the individual. But it is the individual as an aspect of Spirit that impresses us, not the ontologically isolated and

autonomous individual of Hegel's liberal predecessors, notably Kant.

There is a more philosophically profound way of making this point, which makes much more sense of the imagery of Spirit than the usual quasi-mystical accounts. Among the many borrowings of Hegel from Kant was the basic orientation of his philosophy, variously described as "subjective" or "Cartesian" or "phenomenological," although all of these characterizations have the potential to be misleading. (For example, both Kant and Hegel found much to criticize in Descartes, so the "Cartesian" designation has to be much qualified.) This orientation, common to the empiricists as well as most other modern philosophers, might simply be described as "the first-person standpoint," or the attempt to understand the world beginning with one's own experience. Thus the familiar questions, entertained by Descartes, Locke, Hume, and Kant, such as: How do I know that the world conforms to my experiences? Although Hegel will reject this question, as did Kant, they share this phenomenological approach to philosophy and the world in terms of one's own experiences. But, we must ask, **whose** experiences? Are they the isolated and perhaps eccentric experiences of a single individual? Or are they in some sense more general and shared? Kant identifies the subject of all experiences as what he called "the transcendental ego," distinct from the merely empirical ego that we normally refer to as the self, a particular person. The transcendental ego imposes the categories and processes our sensory intuitions into our experience of the phenomenal world, but—and this is the crucial point—it does not experience itself through those same categories. In a famous but somewhat obscure chapter of the *Critique of Pure Reason,* Kant argues against the "paralogisms of psychology," in which the self or soul is misinterpreted as a "thing," a potential object of consciousness. But the self, Kant argues, can never be the object of consciousness; it is always the subject. And because it is therefore immune from the application of the various categories of number, substance, and identity, it cannot be specified as "yours" or "mine," but remains **the** transcendental ego, "consciousness in general." What lies behind this technical move, of course, is Kant's insistence that the forms of experience cannot be matters of personal idiosyncrasy and must be universal and necessary. But Hegel rather easily takes the notion of a "consciousness in general" and converts into a literally general consciousness. That general consciousness is Spirit, the self that pervades and ultimately embraces us all.[28]

The importance of Spirit, however, lies not only in its shared immanence but in its development. The *Phenomenology* is, from beginning to end, the phenomenological account of that development. To put it in an expanded way, the *Phenomenology* adds a new dimension to philosophy, and that is the dimension of history. Not that the

Phenomenology as such is a historical account—although it contains quite a few such accounts, some easily recognizable, some not—but the idea that ideas and movements can be understood only through their development is a bold conjecture, and one rarely appreciated before Hegel (and still too rarely). In his later lectures, this insight becomes the centerpiece of Hegel's philosophy, as he traces the origins and development of the various religions, the course of human history, and the evolution of philosophy itself. Religion, he had recognized toward the end of his early essays, was not abstract dogma but the expression of certain basic human needs and tendencies, and these are not to be found whole in any single religion, nor are they ever entirely absent, but it is in the interplay and development of religions that the ultimate nature of religion emerges—eventually, he suggests, in philosophy. Human history, he will later write, first appears to be a "slaughter-bench," on which whole nations as well as millions of individuals are butchered. But to one who "looks with a rational eye," Hegel argues, "history in turn presents its rational aspect." The history of humanity, brutal as it has been, nevertheless displays an ineluctable sense of progress and increasing freedom.[29] Finally, in philosophy, Hegel teaches us not to see the history of the subject as merely competing answers to the same ill-formed questions but rather as a growth of certain ideas and their importance at certain times into subsequent, improved ideas that have benefited from the conflicts and confrontations of the past. The name of this process or confrontation and improvement, as everyone knows, is **dialectic,** and we shall have more to say about it shortly. But the point to be made here is that the **form** of the *Phenomenology,* its complex organization in terms of some sort of conceptual development, is not just an oddity of Hegel's authorship but, perhaps, the most single important feature of the book.

And yet, the *Phenomenology* is not history, and it is not as such an empirical study of the development of anything, philosophy, humanity, or religion. To be sure, various movements in philosophy are traced in more or less historical order in the first few chapters of the book, and there are bits of actual history spread through the later sections. But one also notes with some consternation that the Greeks are discussed after the moderns and Sophocles after the Stoics, and one would be hard pressed to formulate a historical interpretation that would account for such chronological oddities. What the *Phenomenology* is doing, therefore, is not tracing the actual order of the development of various "forms of consciousness" in history but rather ordering them and playing them against one another in such a way that we see how they fit and how they conflict and how a more adequate way of thinking may emerge. Dialectic is not just development but a mode of argument, and the order of the *Phenomenology* is not just a demolition derby, a process of elimination

and the survival of the fittest, but a **teleology,** a genuine progression from less adequate ways of thinking to more adequate and more comprehensive and, finally, to the most comprehensive way of all.

THE *PHENOMENOLOGY:* PREFACE AND INTRODUCTION

The Preface to the *Phenomenology* is one of the best-known, leastunderstood documents in modern philosophy. Like most prefaces, it was written after the text as a whole was completed, and what it tries to do is to describe the point and purpose of the entire monstrous manuscript. Or, less sympathetically, the Preface is Hegel's attempt to force an interpretation on his book that the text itself does not easily sustain. It is a rambling, convoluted, grandiose monologue punctuated by some striking passages which do, indeed, give considerable insight into Hegel's whole philosophy. It is there that he argues (or insists, at any rate) that "the truth is the whole," that it is a process and not merely a result, and that philosophy must be systematic, scientific, and developmental in its form. But he also insists that such comments are inappropriate in a preface and that, in any case, their whole meaning must be demonstrated in the text, not simply declared beforehand. It is in the actual "working out" of various one-sided positions and "forms of consciousness" that we come to understand how truth emerges in philosophy and how that truth is the history of philosophy itself. One must see ideas and philosophies and whole stages of history as an organic, developing process. In one of his most striking metaphors, Hegel writes, only somewhat tongue-in-cheek:

> The bud disappears in the bursting-forth of the blossom, and one might say that the former is refuted by the latter; similarly when the fruit appears, the blossom is shown up in its turn as a false manifestation of the plant, and the fruit now emerges as the truth of it instead. These forms are not just distinguished from one another, they also supplant one another as mutually incompatible. Yet at the same time their fluid nature makes them moments of an organic unity in which they do not only not conflict, but in which each is as necessary as the other, and this mutual necessity alone constitutes the life of the whole.
>
> (*PG,* 2)

Hegel also announces in the Preface and in the wake of Napoleon his vision of a "birth-time" and the beginning of a new era, and in philosophy

he announces the emergence of what he calls "the concept" *(Begriff),* a holistic comprehension of the world through reason.[30] Indeed, philosophy properly developed should exist wholly in the realm of the concept. But that philosophy would be more in evidence in the works and lectures that followed the publication of the *Phenomenology* rather than in the *Phenomenology* itself.[31]

The Introduction to the *Phenomenology,* by contrast, is short and straightforward. It is indeed an introduction. It sets up the standpoint from which the *Phenomenology* will proceed. The Introduction begins where Kant's first *Critique* ends, with the rejection of skepticism and a declaration of transcendental idealism. The history of modern epistemology from Descartes and Locke through Kant's grand synthesis is very much in evidence there, as it will be in the opening chapters of the *Phenomenology.* What concerns Hegel in the Introduction is a metaphor, or rather, a pair of metaphors, whose consequence is skepticism. The irony is, of course, that the metaphors in question originated with philosophers who could not tolerate skepticism and sought to lay it to rest once and for all. The metaphors concern the seemingly contingent relationship between knowledge and truth. The first and more prominent is the metaphor of knowledge as a tool, through which we "grasp hold" of the truth. The second is the metaphor of knowledge as a medium through which the "light of truth" must pass. Both Locke and Descartes attempted to examine this tool or medium, and the ultimate result was the skepticism of David Hume. Kant was "awakened from his dogmatic slumbers" by Hume but only pursued the metaphor further with his "critique" of reason and the understanding. Hegel's argument, simply stated, is that the metaphor itself is mistaken. Skepticism can be laid to rest, as Kant had tried and seemingly succeeded in doing, only if the contingency of knowledge and the metaphors of knowledge as instrument and medium are rejected from the outset (*PG,* 73).

In Descartes, Leibniz, Locke, and Berkeley, the distinction between our knowledge and "the external world" had made way for Hume's devastating skepticism. Kant had solved the problem, in the eyes of many philosophers of the time, by incorporating the external world into the realm of knowledge itself, constituted by the categories of the understanding and the forms of intuition. But with Kant's further distinction between phenomena and noumena—the world-as-we-know-it and the world-as-it-is-in-itself—it remains impossible for us to know the world as it is in itself. Once the distinction is made between the world-for-us and the world-independent-of-us, there can be no escape from the conclusion that we can know only the world as it is for us. Hegel's pursuit of absolute knowledge begins with the rejection of this distinction.[32]

In the Introduction to the *Phenomenology,* Hegel begins his revision of

Kant's theory of knowledge by attacking just this distinction, which he claims is based on unanalyzed and undefended metaphors in which knowledge is considered a "tool with which one masters the Absolute." If knowledge is a tool, there must be a certain necessary distortion due to the operations of knowledge on reality, and therefore we can never know reality (the Absolute) itself but only as it has been manipulated and distorted by the instrument of knowledge. We can, therefore, have only mediated knowledge of the Absolute, and never know the Absolute itself. This is Kant's problem in the first *Critique,* and his solution to it is the critical doctrine that we never know reality independent of the conditions imposed on it by knowledge. The best that can be done by the philosopher is an exploration of the nature of this tool of knowledge and the demonstration of the necessary conditions it imposes on reality. Kant's *Critique,* therefore, abandons the search for absolute reality and simply investigates the tool by which we come to know reality.

But why should we accept this metaphor? Kant never examines or defends this metaphorical starting point, and Hegel turns it against itself:

> If the fear of falling into error sets up a mistrust of Science, which in the absence of such scruples gets on with the work itself and actually cognizes something, it is hard to see why we should not turn around and mistrust this very mistrust.
>
> (*PG,* 74)

By beginning with the investigation of the faculties of knowledge, Kant has already determined the critical outcome of his first *Critique*. Once the distinctions between things as known and things in themselves and between reality-for-a-subject and absolute reality are introduced, one must conclude that we cannot have any but conditioned knowledge and that the demands of traditional metaphysics are utterly impossible. Kant, according to Hegel, offers no justification for this starting point and, more importantly, fails to see fatal problems inherent in this approach. First, the metaphor simply plays on the notions 'truth', 'reality,' and 'knowledge,' and, given Kant's distinctions, Hegel argues that what he ought to have concluded was that we can have no knowledge at all, that our cognitive faculties are such that we can never know the truth. Second, Hegel argues that one cannot begin by investigating the faculties of knowledge before one attempts to gain knowledge in philosophy, for the investigation itself already utilizes these faculties and their concepts. Any such analysis is covertly circular, and one might as well try, Hegel suggests, to learn to swim before getting into the water.

Thus Kant, on the basis of the instrument metaphor, distinguishes

between two different sorts of knowledge, two different kinds of truth. There is limited or conditional knowledge giving us truth limited by the conditions of our cognitive faculties, and there is absolute or unconditioned knowledge of things as they are in themselves which human consciousness cannot have. But even limited truth is indeed truth only if it is the way things really are. If it is an unconditioned or *a priori* truth that all events must be temporally ordered (for us), then this limited truth is a truth only if all events really are ordered. If events are not really so ordered, but rather ordered by us, then this limited truth is a falsehood, even if it is **necessary for us.** (Thus Nietzsche will argue that **all** of our *a priori* or necessary truths are such 'falsehoods.') Similarly, our conditioned or limited knowledge is really knowledge only if it is in agreement with what is really true. If we have conditional knowledge that there exist objects 'outside' us due to the nature of our cognition, this knowledge is true knowledge only if there truly are such objects. In other words, truth is Absolute Truth; knowledge is Absolute Knowledge. The 'real' world is the world as it is in itself, whether that is the world of our experience or not. But what would it mean to even suggest that it is not?

Hegel's reason for rejecting the dualism between knowledge and reality is not simply its skeptical conclusions; the preliminary investigation of knowledge, which is part and parcel of the "knowledge as tool" metaphor, is logically ill-conceived. Kant argues that philosophy must begin by examining those faculties which purport to give us knowledge, but with what do we examine these faculties? The investigation of cognition must itself be carried out by cognition; thus Kant demands that we examine reason by using reason, but a preliminary investigation of the tool of knowledge is already a use of that tool. Hegel agrees with Kant that philosophy must begin with an investigation of knowledge, but unlike Kant he recognizes that this investigation cannot be independent of the use of the faculties of knowledge. Hegel argues that the investigation of knowledge changes that very knowledge, and that such an investigation can never be preliminary, but constitutes the whole of philosophical investigation. The critique of knowledge is the development of knowledge as well.

Once we appreciate this problem as Hegel perceived it, we are in an excellent position to understand the necessity for the peculiar dialectical structure of his work, particularly of the *Phenomenology.* Knowledge *develops* with our conceptual sophistication. This is not to say merely that as we learn more, our knowledge increases; rather, the **kind** of knowledge changes. Specifically, knowledge changes in kind when we turn to focus on our faculties of knowledge, when we question not so much our knowledge of the world, but ourselves. For Kant, self-knowledge was either empirical knowledge of ourselves as phenomenal objects or transcendental

knowledge which could disclose only the necessary forms of our consciousness, but, according to Kant, we could not have knowledge of ourselves in any other sense (e.g. as moral agent or as immortal soul). Neither could we have knowledge of things-in-themselves. For Hegel, knowledge of objects and transcendental self-knowledge are but two stages in the attainment of further kinds of knowledge, knowledge of oneself and the world as Spirit. The *Phenomenology* is just the demonstration and the development of such knowledge, starting with the lowest forms of knowledge, showing how these are inadequate to other forms, and culminating in Absolute Truth in which all of the problems, paradoxes, and inadequacies of the lower forms disappear.

Philosophy, for Hegel, is the demonstration of the 'becoming' of Absolute Knowledge. Such a becoming need not be the pattern of development of any particular individual consciousness, and the development of knowledge in the system is not the psychological development of an individual. For that matter, it does not faithfully appear in or as the history of philosophy either, although this history is inevitably a close approximation of the development of Absolute Knowledge and Spirit. The "forms of consciousness" or forms of knowledge derived in the *Phenomenology* lead to Absolute Knowledge, that level of conceptual development where traditional conceptual (philosophical) problems disappear, but it is not at all obvious that there is but one route—the way described in the *Phenomenology*—from partial or inadequate knowledge to absolute knowing.[33] At the ultimate stage of knowledge, traditional philosophical dichotomies are eliminated and nature and Spirit find their place together. The Fichtean antitheses of dogmatism and idealism are synthesized. The development of Hegel's system is the "working out" of these various traditional forms of consciousness and ordering them in a hierarchy of more sophisticated forms. The purpose of this ordering is to demonstrate how each level corrects inadequacies of the previous conceptual level and how it is possible to correct all these inadequacies once we adopt an all-encompassing vision of the whole rather than limit ourselves to advocacy of this or that particular position.

CONSCIOUSNESS AND THE DIALECTIC

The *Phenomenology* is divided into three uneven sections, each representing one type of 'form' or 'level of consciousness,' in (more or less) ascending order of sophistication. The first and shortest section is called "Consciousness," which deals with relatively naive epistemological consciousness. It is a critique, among other things, of the narrowly

epistemological vision of philosophy that had begun to emerge in the eighteenth century and which still, regrettably, persists today.[34] The second is called "Self-consciousness" and traces the first crude beginnings of the awakening of the consciousness of Spirit in its early form of simple antagonistic recognition of other people and the development of paradigms of dominance and submission ("master and slave") as prototypical forms of self-recognition and awareness. Finally, there is the long, twisting section on "Reason," which traces the ultimate development of a holistic spiritual-rational consciousness from the most simple sense of community to its penultimate realization of Spirit in art and religion before its ultimate realization in Hegel's philosophy.

We can summarize the progression or dialectic of the section on "Consciousness" in three readily identifiable steps, each of them corresponding to a family of "common-sense" claims and philosophical positions. At the beginning is the common-sense notion which Hegel calls "sense-certainty," that we simply know, prior to any verbal description or conceptual understanding, what it is that we experience. Hegel demonstrates that such a conception of knowledge is woefully inadequate. He then brings us from this naive realism through a number of theoretical variations in which can be recognized major insights from Leibniz and some of the empiricists, which he abbreviates as "Perception," to the philosophy of Kant's first *Critique,* in which knowledge is demonstrated to be a form of understanding. In "Understanding," Hegel also tackles the question of the thing-in-itself by way of an extended *reductio ad absurdum* and, following his opening argument in the Introduction, shows us the nonsense of supposing that the true world might be different from the world of our experience.[35]

The first section of the *Phenomenology* develops the role of the understanding in experience, but as an analysis of the entire movement in modern philosophy including such central problems as the nature of substance, the necessity of concepts, and the nature of connections between experiences and the synthesis of objects. In other words, it covers, in a dialectical way, the subject matter of Kant's first *Critique* and the major epistemological work of Locke, Berkeley, and Hume. The stage of consciousness referred to as "sense-certainty" is "knowledge of the *immediate*" (*PG,* 90; Hegel's italics). It is "what is presented before us," "what is given." It is "the richest kind of knowledge, of infinite wealth…. It is thought to be pure apprehension without yet any conceptual comprehension, raw experience, without the need of understanding, the experience of a passive sensitive receptacle" (*PG,* 91). But because it involves no understanding, just a pure knowledge of "This," the particular thing in front of me, one might say that this stage is not truly consciousness or knowledge at all, but merely "knowledge implicit." This

is the pure data of the senses which so many philosophers, of this century as well as the past, have taken to be the indubitable, secure foundation of human knowledge. It is pure experience, uninterpreted and thus unadulterated by us in any way. Accordingly, sense-certainty also includes the claims of many mystics and intuitive philosophers, including, perhaps, Schelling and Jacobi, who have claimed that the knowledge of the Absolute is not conceptual or rational but strictly intuitive, a pure experience, undistorted by human concepts and categories. Traditional epistemologists have argued that errors in human knowledge, when they arise, must arise after this level. For on this level, our knowledge is certain and becomes fallible only when we attempt to conceptualize or to understand our experiences.

Although this section is among the shortest of the *Phenomenology,* it provides us with some vital clues for understanding the nature of Hegel's dialectic. Hegel's argument against this form of 'knowledge' as certain knowledge, or even as knowledge at all, is clear and to the point. Briefly, Hegel argues that this knowledge, which he describes as a mere "this, here, now," is the very opposite of pure, "authentic" knowledge, knowledge which is complete as opposed to all other knowledge which is abstract and conditioned. It is really "the most abstract and poorest truth" (*PG*, 91). It is what we "mean" only in the sense of pointing *(this)* and thus not really meaning at all. It might be said to be reference, perhaps, but not sense. In fact, it is not even reference. How does one point to a particular without specifying what it is to which one is pointing? Thus Hegel concludes that there can be no knowledge without concepts, and the supposed certainty of sensecertainty seems certain only because it is not knowledge at all. It is, at best, mere presence. The infallibility of sense-certainty, of pure experience, lies in its failure to assert any claim to knowledge which might be shown to be wrong. This knowledge which "is called the unutterable, is nothing else than the untrue, the irrational, what is merely meant" (*PG,* 110).

We can see that Hegel essentially agreed with Kant that there can be no unconceptualized knowledge, that knowledge is essentially a product of the understanding. From this agreement, however, we can also appreciate one of the keys to Hegel's works, that knowledge is essentially an *active* process, that mere experience can never give us knowledge, that synthesis of experience by rules or concepts is necessary. To use a common philosophical term, knowledge necessarily consists of *universals*. This does not mean that it is the same the world over, "for all rational creatures" as Kant would say. It means that all sense and reference relies on concepts, on the recognition of general properties which apply not to this or that particular but to an indefinitely large number of particulars (and possibly to no actual particulars at all). One might note that Hegel's insistence on

universality as the essence of knowledge is already a reply to the Schelling-Kierkegaard criticism of Hegel as a "negative" philosopher (who ignores individual existence) which gathers momentum after Hegel's death.

The *Phenomenology* is not a running autobiography of Spirit but rather a retrospective of the development of Spirit, an attempt to understand why some forms of consciousness are inferior to others and force us to search for more adequate, more all-embracing modes of comprehension. The transitions between forms of consciousness represent a demonstration and a development, perhaps an explanation, but there is no mechanism which pushes one stage to the next and Hegel does not claim that each stage necessarily leads to the next. What he does claim is that the process itself is necessary, that consciousness is driven by its own inadequacies to pursue other modes of understanding. Sense certainty is not itself a mode of consciousness but, in more modern terminology, a theory about consciousness, a conception of knowledge. Hegel shows that this conception of knowledge is an inadequate conception, and concludes that no such conception of knowledge can succeed. Sense-certainty is inadequate as knowledge because it is not knowledge at all. Therefore, we move along the dialectic to a more adequate form of consciousness, which is that of *Perception*.

Perception is the first appearance of knowledge, for now we can interpret our experiences by applying concepts. In Hegel's short description, the object of consciousness is now "the thing." As a thing, the object is characterizable and characterized by ascription of properties, in other words, by the application of universally applicable concepts to a particular. Our experience is therefore no longer "pure" experience but experience of a thing defined by its properties. For example, our perception of a tree consists of a certain unity of colors, shapes, tactile sensations, perhaps sounds, and smells. Over and above this, we suppose that there is *the tree*, that which "lies behind" all of these experiences and ties them together. In traditional philosophical terms, there is the tree as *substance* which is responsible for the unity of the tree-perceptions. The problem, familiar from Locke, Hume, and Kant, is what if anything warrants our conclusion that the tree-perception refers to the tree, for any substance 'behind' these perceptions is by its very nature not the object of any possible perception.

In the recent history of philosophy, this line of questioning sent Berkeley to idealism, the view that there are no material substances, only ideas, although idealism does not yet appear as such in the Hegelian hierarchy of knowledge. In Hegel's terms, substance would be an "unconditioned universal," that is, not experienced through the senses. As such, it cannot be an aspect of perception. Thus Locke was forced to some rather *ad hoc* stipulations to explain how we can make the inference to substance and

Hume insisted that we could not justifiably make such inferences in philosophy. Moreover, there was the question, unanswered and even unasked by the traditional empiricists, how the various properties perceived were in fact unified as the properties of an object. Since that general view of knowledge which Hegel calls "perception" does not recognize the extraperceptual, that is, anything but conditioned (sensory) universals, if we are to understand the unity of objects and the idea that we actually know objects and not mere clusters of properties we find ourselves moving on to the next stage of consciousness.

The solution to the problem of unity is provided by the understanding. The concept of "understanding" here is clearly taken from Kant's use of the term and refers to the application of concepts to experience. However, as Kant uses the term, there is a special focus on *a priori* or "unconditioned" concepts, which Kant calls the "categories." Among these categories is the category of substance, which is the solution to the problem of unity. The tree-perceptions have a unity of a tree because of our employment of the concept of substance. Similarly, problems such as the coexistence of various objects, the reality of causal interconnections between perceptions, as well as successions of perceptions, all appear at this level of the dialectic, to which one might refer as the Kantian level, for it consists primarily of the conclusions of the Transcendental Analytic of the first *Critique*.[36] Of central interest in this section is Hegel's analysis of the theory of the understanding as culminating in a dual worldview. On the one hand, there is the world as perceived, and the laws intrinsic to that perception. On the other hand, there is the world in itself, which is postulated 'behind' this world to 'explain' it.

In the understanding, we postulate 'unconditioned universals' in our experience to represent objects in themselves. But Hegel does not adopt the traditional notion of 'substance' for those objects. He prefers a more dynamic vision of experience, and so calls them as 'forces' or 'powers,' which are related to the "kingdom of laws" which is Kant's vision of a necessarily unified and ordered (phenomenal) world. But while the chapter called "Force and understanding" is essentially Kantian, it contains a powerful critique of Kant's *Critique* and suggests that the laws of nature are not merely imposed but inherent in the world itself. In other words, Hegel rejects the Kantian insistence that we should not look for "the universal laws of nature in nature" but rather "in the conditions of possibility of experience."[37] According to Hegel, there is no valid distinction to be made here. Indeed, Hegel suggests that scientific explanation might better be understood as a **redescription** of phenomena. Again, Kant's noumenon-phenomenon distinction is fundamentally wrong; if there is any sense to be made of the notion of "thing-in-itself" it must be as part of the thing-as-phenomenon. Indeed, "the Understanding in truth

comes to know nothing else but appearance…in fact, the understanding experiences only *itself*" (*PG*, 165; Hegel's italics). Noumena are not transcendent to phenomena but immanent in them.

The closing argument of "Force and understanding" and the "Consciousness" section as a whole consists of one of Hegel's longest and most peculiar counterexamples. He postulates a noumenal world which happens to be an inverted *(verkehrte)* world. According to Kant, the world-in-itself is a necessary supposition of the conditions of knowledge but by its very nature cannot be known. Because knowledge depends on the human faculties of knowledge, and because we cannot know that our knowledge is not therefore some distortion of things as they exist independent of our experience of them, we must, while supposing our knowledge to be valid, resort to *noumenon* which very possibly might have its own principles, different from the world as perceived and known by us. Kant insists that there is nothing more to be known about the world in itself, this unknown "x." But Hegel provocatively goes on to suggest what the world-as-it-is might be like by suggesting that everything in this world is 'unlike' that in our own. "What is there black is here white, what by the first law [of phenomena] is in the case of electricity the oxygen pole becomes in its other supersensible reality the hydrogen pole" (*PG*, 158). The two-worlds doctrine is carried to the realm of morality, where Hegel argues that the two—worlds view destroys the very concept of morality it is invoked by Kant to protect. For, according to Hegel:

> an action which in the world of appearance is a crime would, in the inner world, be capable of being really good (a bad action be well-intentioned); punishment is punishment only in the world of appearance; in itself, or in another world, it may be a benefit for the criminal.
>
> (*PG,* 159)

Here we have the first reference to Kant's morality, which begins with the crushing criticism of Kant's *summum bonum* and his entire two-world view. The problem, as stated here, is that the *summum bonum* and Kant's morality in general require man and his actions to be considered as noumenon. A man and his actions are also part of the phenomenal world where they are evaluated, and Hegel is here briefly pointing out the problem in applying the phenomenonnoumenon distinction to a man acting. Why suppose that what we consider punishment to the phenomenal man will have any such effect on man as noumenon. Here, even in this first section, we have a clear indication of the continuing attack of Kant's moral-religious philosophy that will be the core of Hegel's mature writings.

The inverted-world passage is essentially an argument by ridicule, for what becomes evident is that, if we take Kant's notion of noumenon seriously, any sort of nonsense becomes equally intelligible. Either the noumenal world is just like the phenomenal world, or, not only does it not make sense to talk about it, but it does not even make sense to suppose that there might be one. The inadequacy of consciousness, considered in its entirety, is the inadequacy of Kant's philosophy, which Hegel considers the culmination of all modern philosophies before it. The inadequacy of the understanding as such is a signal to a new move in philosophy, a move which is not simply new knowledge or a new progression in conciousness, but which is an entirely new *kind* of knowledge and a new kind of consciousness. Insofar as one wishes to interpret the progress of the *Phenomenology* along philosophical-historical lines, one might say that this new stage was initiated implicitly by Kant and made explicit by Fichte. But the *Phenomenology* is not intended to be just a history of philosophy.

Throughout the *Phenomenology,* Hegel displays similar inadequacies in one form of consciousness after another, and so we are guided from one form to another in an ongoing "dialectic," eventually to reach "absolute knowing," which is the all-encompassing overview of all that has preceded it. The dialectic often proceeds by way of conflict and confrontation, when one form of consciousness contradicts another. But it is a misunderstanding of Hegel to think of the dialectic as a mechanical meeting of "thesis and antithesis," resolved by a "synthesis." That formulation, which comes from Kant, Hegel explicitly criticizes. The dialectic is rather a complex interplay of conceptions, some of which are simply improvements on others, some of which are indeed opposites demanding synthetic resolution, but others simply represent conceptual dead ends, which indicate a need to start over. Indeed, it is not at all clear that Hegel's dialectic is a linear progression from simplicity to the absolute but rather a phenomenological tapestry in which a great many (hardly "all") of the forms of human experience and philosophy jostle against one another and compete for adequacy. Within that tapestry, however, can be found much of the history of Western epistemology and metaphysics, and a great deal of ethics and social history and the history of religion. Whether or not Hegel reaches the absolute, as he states so proudly in his Preface, he gives us an eclectic but systematic philosophy which boldly demonstrates both the complex life of ideas and the role of those ideas in defining human history and consciousness.

SELF AND SELF-CONSCIOUSNESS

The *Phenomenology* makes what might well seem to be an abrupt turn from consciousness, an essentially epistemological study, to self-consciousness and "the truth of self-certainty" and an obscure discussion of "desire" and "life." But the historical linkage here is provided by Fichte, who had charted the move from the theory of knowledge to the importance of a broad, pragmatic conception of self-knowledge several years before. Consciousness becomes self-consciousness when it understands itself as the source of the understanding. To consider the problems of knowledge alone, without reference to the uses of knowledge and the psychological-social world in which knowledge functions, is futile. Thus any adequate conception of knowledge must begin with an understanding of the living self, which is not first of all epistemic but needy, full of demands and desires.

"Self-certainty," like sense-certainty, begins with a commonsense, cocksure conception of the self—in this case clearly reminiscent of Descartes's "I think, therefore I am." Hegel goes on to show that the self is not certain at all. To the contrary, in the confusion of desire and the urges of life the self is confused and desperately seeking in identity. As in the preceding epistemological chapters, Hegel will bring us from a naive view to a more complex and sophisticated philosophical standpoint, but in contrast to the preceding chapters he will now insist that there is an essentially "practical" dimension to knowledge. But "practical" here means, as in Kant, the self conceived as a true self, not just the self of appearances. Accordingly, what emerges in the section on "Self-consciousness" is a reappearance of the old dichotomy of appearance and reality. But instead of rending the world in two, as in the "upside-down" world, the self is shattered into the most "unhappy" of consciousness.

Following Hegel's brief opening comments on the supposedly self-certain "I" and its relation to desire and life, we find the bestknown and most dramatic single chapter in the *Phenomenology,* the parable of the "master and slave." The point is to show that selfhood develops not through introspection but rather through mutual recognition. The self is essentially social or, more accurately, interpersonal, and not merely psychological or epistemological. But Hegel is also concerned to speculate on a certain kind of "natural" relationship between primitive, "stripped-down" human beings. It is an imaginary situation envisioned by many philosophers (notably Hobbes and Rousseau) in their hypotheses about the "state of nature." Their common assumption is that human beings are first of all individuals and only later, by mutual agreement, members of society. Hegel thinks that this assumption is nonsense, for individuality begins to appear only within an interpersonal context.

The confrontation of two consciousnesses is the key to the master-slave relationship, which Marx would later take up as a model for his social theory and Jean-Paul Sartre would borrow as a paradigm for his analysis of "Being-for-others" in *Being and Nothingness*. Hegel tells us that "self-consciousness achieves its satisfaction only in another self-consciousness" (*PG,* 175), and that "Self-consciousness exists in itself and for itself when and by the fact that it so exists for another; that is, it exists only in being acknowledged" (*PG,* 178). These cryptic sentences are the crux of "self-consciousness"; they spell out for us the first appearance of Spirit—the recognition of the existence of a universal consciousness in the primitive form of the recognition of consciousness other than one's own. But Hegel is also arguing a radical thesis about the nature of origin of selfhood. First, there is the suggestion that the concept of "self-consciousness" or "self-identity" can only arise in confrontation with others. Hegel's thesis might thus be construed as the claim that a person has no concept of self, cannot refer to themselves and cannot say things about themselves (for example, ascribe states of consciousness to themselves) until he is shown how to do so by someone else. This thesis has remarkable affinities with Ludwig Wittgenstein's and later P.F.Strawson's claim that psychological predicates can only be learned through learning to apply them to someone else.

Second, there is a more modest thesis that one can only develop self-consciousness, that is, a particular concept of oneself, through confrontation with other people. This weaker thesis does not insist that one cannot have concepts of self-reference before social confrontation but rather that the particular image one has of oneself is acquired socially, not in isolation. It is this sort of thesis which occupies much of Sartre's quasi-psychological efforts in *Being and Nothingness*. The first claim, that concerning the concept of self-reference, is not pursued by Hegel, for he considers self-reference as such to be "merely formal" and "entirely empty," hardly worth the title of "self-consciousness" at all. (Compare his discussion of the "knowledge" of sensecertainty.)[38] The second thesis, however, seems to fit precisely into the overall ambition of the *Phenomenology,* to show how an inadequate conception of oneself is forced into some remarkable and surprising twists and turns.

The first part of the master-slave parable is quite simple and straightforward: two self-consciousnesses encounter each other and struggle to "cancel" each other in order to "prove their certainty of themselves" (their independence and freedom) against the other, who appears as an independent and therefore limiting being.[39] Each self-consciousness originally tries to treat the other as object, but finds that the other does not react as an object. Each demands that the other recognize them as an independent consciousness. But recognizing another as

independent limits one's own independence, and each becomes determined to prove their own freedom and independence. Hegel tells us:

> they have not yet exposed themselves to each other in the form of pure being-for-itself, or as self-consciousness. Each is indeed certain of its own self, but not of the other, and therefore its own self-certainty still has no truth.
>
> (*PG,* 186)

Hegel suggests that it is solely by risking one's life that such a truth is established, and, indeed, the two self-consciousnesses fight (almost) to the death. The other must be "cancelled" because their otherness contradicts one's view as self-conscious, free, and independent. However, it becomes clear that the role of the other in this life-and-death struggle is not only that of a threat or purely destructive. The recognition by the other of one's self is at the very crux of the conflict. Thus it is gaining the recognition of the other that is the point of the battle, not the extinction of the other. Hegel says that "trial by death does away with the truth which was supposed to issue from it, and so, too, with the certainty of self generally" (*PG,* 188). Thus Hegel argues that self-consciousness requires the presence of another for one's own self-consciousness. In fighting for recognition, each tries to save their own life, but each tries also, if possible, to preserve the life of their opponent. If one consciousness is victor, and neither loses their life, then one becomes a consciousness "for itself," independent, a master, while the other becomes a consciousness 'for another," a slave whose essence, Hegel comments, is "life," suggesting that all that the slave has salvaged, at least for the moment, is their life.

The lord or master "is the consciousness that *for itself,* which is mediated with itself through another consciousness" (*PG,* 190). But the master, although self-sufficient in the sense of having the slave dependent on him, is also dependent on this dependence. Because the master maintains the power, they are the master, but because they are now self-sufficient only through the industry of the slave, they are also dependent on the slave. Hegel stresses the importance of a Lockean relationship to "the thing"—presumably land, food, or some craft—which the slave has immediately ("he labours upon it") but "the master only mediately, except that he gets the enjoyment of it" (ibid.). In the course of the dialectic, the slave, because of their direct relation to the thing, becomes self-sufficient, while the master, because of their dependence on the slave, becomes wholly dependent. (From this reversal Marx is to take his central theses of class struggle and the ultimate degeneration and self-destruction of the economic master classes.) Furthermore, the problem of the continued need for the recognition of the other breeds a further instability into this

relationship. The master, who depends on the slave for the recognition that they are indeed the master, now finds that the slave is a totally dependent creature without an independent will, incapable of giving them the recognition of an independent other. The slave, in other words, becomes a "yes-man," whose recognition is irrelevant precisely because it is coerced.

In the master-slave relationship, we first see the striving for freedom of Spirit, the ultimate truth of self-consciousness. In the master-slave relationship, we see only the inadequacy of the attempt to derive this truth from human relationships which treat persons as independent and opposed. Hegel will go on to argue that the way to freedom, the goal of self-consciousness, lies not in such relationships but in the direction of increased civilization. Rousseau had famously argued that society takes a man and turns him into a citizen. For Hegel, too, individual freedom will be found not in isolated independence but in citizenship. But none of this, the explicit recognition of Spirit, appears in the section on "Self-consciousness." The master-slave relationship rather gives way to the wholesale rejection of the master-slave situation and the mutual dependency it entails, denying all external reality and rejecting all action as meaningless. Here Hegel locates the impressive philosophy of Stoicism, which flourished in the ancient world for more than 600 years. The Stoic rejects both slavery and mastery, and Hegel makes much of the fact that two of the leading Stoics, Epictetus and Marcus Auelius, were a slave and the master of the Roman Empire respectively (*PG,* 197–203). In an even more extreme form, self-consciousness attempts to get beyond the frustrations of the master-slave relationship by taking everything as meaningless, which Hegel interprets along the lines of the ancient (not the modern) philosophy of Skepticism (*PG,* 204–5). Ultimately, the contradictions or disharmonies of all possible forms of self-consciousness become explicit in a self-consciousness that is so alienated that it conceives of itself as nothing, or as worse than nothing, in contrast to a holy ideal before which it humbles itself. This unhappy consciousness is the primitive Christian ascetic who believes himself to be both part of this world and essentially divine, but the "creature of the flesh" and the "soul before God" cannot coexist (*PG,* 206–30). The master-slave relationship, which became an impossible relationship between two people, here becomes internalized in a single schizoid individual. A decade after Hegel's death, Hegel's Danish critic Søren Kierkegaard would return to this disharmonious Christian for his "knight of resignation." Where Kierkegaard will insist that this incomprehensible schizophrenia is a necessary condition for Christianity, however, Hegel insists that we go beyond this internalized master-slave relationship with its self-

flagellation and self-denial. At the very end of the discussion of the "unhappy consciousness" and the section on "Self-consciousness," Hegel anticipates a new and happier conception of Christ and Christianity, but not through self-consciousness alone. It is rather in "the idea of *Reason,* of the certainty that, in its particular individuality, it has being absolutely *in itself,* or is all reality" (*PG,* 230; Hegel's italics).

REASON AND SPIRIT

Rational consciousness is the goal of the *Phenomenology,* a final "unification of the diverse elements in its process" and "the consciousness of the certainty of being all truth" (*PG,* 231). Reason resolves by harmonizing and elevating *(autheben)* the disharmonies between self and others, between God and man, between morality and personal inclination, between nature and knowledge. The Spirit of Absolute Knowing is both immanent God and human society. It is also nature, which one might think of as the material aspect of Spirit. There is no separating God from nature or from man and it is folly to separate freedom from nature, reason from passion, or morality from society, as Kant seemed to have done in his philosophy. Reason in the *Phenomenology* marks the synthesis of a number of conflicts that have been introduced in the dialectic of the *Phenomenology* itself, the inadequacies of traditional epistemological thought, the resolution of the master-slave relationship, and interpersonal conflict (including the internalized conflict of the unhappy consciousness); and, most ambitious of all, the *Phenomenology* is Hegel's first attempt to integrate and harmonize all human forms of consciousness and find the proper conceptual place for each of them.

The long section on "Reason"—considerably more than two-thirds of the *Phenomenology*—appears to have no organizing principle or straightforward argument, such as one can discern in the first two sections on "Consciousness" and "Self-consciousness." The first part of the section is a lengthy discourse on the philosophy of nature, including what we would now call the philosophy of science, and it culminates in a particularly peculiar discussion of the oddball sciences of physiognomy and phrenology, the claims that personality and deep psychology can be "read" from certain facial features or the bumps on a person's skull. What occupies Hegel throughout the entire discussion, however, is an attempt to emphasize the nature of the organic, rejecting the familiar Cartesian divisions of mind and body, "inside" and "outside," and the reductionist conceptions of nature. The argument about faces and skulls is not so much

a defense of dubious sciences as it is a defense of the integration of our conceptions of psyche and expression, much as he had argued for the organic integrity of nature earlier in the discussion.[40]

Immediately following this discussion we find ourselves suddenly steeped in certain perennial questions of ethics, "the actualization of rational self-consciousness through its own activity" (*PG,* 347ff.). If there is a principle of transition here, apart from the holistic impetus that motivates all of reason, it is not at all easy to discern. In rapid succession, Hegel considers hedonism, what we would call moral self-righteousness, and a certain tragic conception of integrity or "virtue," but the discussion here seems to follow more or less directly from the unhappy resolution of self-consciousness. Indeed, one of the more familiar channels of denial for the unhappy consciousness is the soon jaded road of hedonism. The predictable reaction, a stubborn asceticism and the rejection of "the way of the world," is equally familiar in both literature and life (*PG,* 381). In these short chapters, as so often for the rest of the book, Hegel seems to be incorporating any number of more or less contemporary themes and controversies, rarely identified as such, from the psychology of Rousseau to the world-weary asceticism of the Jansenists. Nevertheless a general theme is perceptible through the details and meanderings, and that is the inadequacy of any conception of ethics that remains restricted to the isolated individual. Thus the emphasis in this discussion is on the phrase "actualization through its [one's own] activity," which leads inevitably to new versions of the frustrated, unhappy, divided consciousness. The discussion culminates in Kant and a discussion of the categorical imperative. This is, perhaps, the most enduring argument of the *Phenomenology,* some aspects of which are routinely trotted out in introductory ethics classes as criticism of Kant without recognizing their source in Hegel. But before we actually get to Kant, Hegel slips in one of the oddest chapters of the entire *Phenomenology,* a covert discussion of university life under the title, "The Spiritual Animal Kingdom and Deceit, or 'the Matter in Hand' itself" (*PG,* 397–418). To explain just the title would take several pages, but the upshot of the chapter is as easy to understand as it is amusing. Professors love to conceive of themselves as independent individuals, but they really are the ultimate conformists, utterly dependent on each other and on their mutual opinions of one another. Whereas the unhappy independent spirits of the "Actualization" chapter erred in their efforts to remain wholly isolated, the rather self-satisfied creatures in the "academic zoo" simply pretend to be isolated and independent, whereas in fact they are nothing of the kind. It is from here we suddenly leap into the ethical thinking of the greatest professor of all academic zoos, Immanuel Kant. For he, too, likes to feign an autonomy that is more imagined than actual.

Ever since Kant, autonomy has been the watchword of ethics. Autonomy is the ability of each of us, as rational creatures, to ascertain for ourselves what is right and, in words drawn from Rousseau, impose the moral law on ourselves. Ethics in general and Kant's categorical imperative in particular concern the recognition of our moral autonomy. Indeed, one of the three formulations of the categorical imperative appeals explicitly to the notion of autonomy.[41] But Hegel criticizes this notion of autonomy, and he does so on two different grounds. The arguments are quite succinct, perhaps because Hegel had already published them at length elsewhere.[42] The primary criticism, still the focus of much critical discussion today, is the illusory nature of Kant's moral self, which is no particular self with no particular properties but simply a confused abstraction from the social life of bourgeois or *bürgerlich* Prussian morality (*PG,* 419f.). Moreover, the basic Kantian distinction between reason and the "inclination" unwisely divides the moral self in two and gives unwarranted precedence to formal laws rather than particular moral contexts (*PG,* 425f.). But those formal laws, Hegel argues (like our best undergraduates today), cannot be so readily applied to our concrete, often ambiguous everyday situations. There is no satisfactory criterion for "testing laws," as Kant had argued; there are only the *ad hoc* stipulations of the "maxim" of one's actions such that the moral law can be made to fit as needed (*PG,* 429–37). But behind these brief hit-and-run attacks on Kant, Hegel has an alternative conception of ethics, which will soon appear. What he really objects to is the bogus individualism and *a priori* universality of Kant's notion of morality *(Moralität)*. In its place, he will emphasize the social foundations of ethics, or *Sittlickkeit,* much as he had in his first youthful essay on Greek folk religion over a decade before.

The notion of *Sittlichkeit* stands at the center of Hegel's ethics, and with it we are finally informed that we are now on the home ground of Spirit. The master-slave relation may have in some sense appeared to be a social encounter, if by that one means only the joint appearance of two or more mutually aware creatures, but society and the social are much more than a collection of individuals. They presuppose mutual attachments and dependencies—just those attachments and dependencies that those antagonistic self-consciousnesses denied. They presuppose a sense of community, a shared identity. Ethics, in other words, is based on community values, on shared customs *(Sitte),* not autonomy. And reason, in Hegel's philosophy, refers not to that abstract *a priori* ability to calculate and deliberate so much as the very concrete conception of oneself as part of the whole. Reason is not an individual "faculty" but a social process. And ethics as an exercise of practical reason means not working it out for oneself so much as understanding one's duties and obligations to one's community.

But, of course, there are different communities, with different customs, and sometimes these communities come into conflict. Nothing could have been more evident to Hegel, who as he wrote watched the tragedy of Europe tearing itself apart in the name of competing ideologies, just as Germany had torn itself apart many years before in the name of what would appear from a distance to be a couple of theological nuances.[43] Thus the upshot of Hegel's philosophy and the grand hope of the *Phenomenology,* announced with great fanfare in the Preface, is the birth of a new, international world, in which cultural differences might be preserved but the harmony of the whole would be assured. But this is getting ahead of ourselves. At this point in the *Phenomenology, Sittlichkeit* has just appeared, and it is immediately rent apart by tragedy. Within communities, as well as between them, conflict is always possible. And as so often in Hegel's writing, particular conflicts have great philosophical consequences. At this juncture, Hegel chooses to write about Sophocles' tragedy *Antigone,* one of his favorite plays (which he would discuss at length again in his *Philosophy of Right,* fifteen years later). The point of the play is taken to be the clash of two sets of laws, human and divine. The divine law, defended by Antigone, is the law of the primitive tribe, blood law, the ultimate sanctity of the family. The human law, or what would later become civil law, was represented by Creon, the king. In the battle over the burial of Antigone's brother, required by sacred law but prohibited by Creon, the two laws meet in mortal conflict within the individual person Antigone. She is simultaneously embedded in two societies, the "divine" tribal society of her family, in which family duty and honor were all, and civil society in which law and obedience were essential. Her individual case is tragic and unresolvable, but the movement of history and the dialectic provide a resolution to the conflict which was not available for the tragic heroine. With the development of modern civil society, individuals and families are integrated under the law of the land.

Hegel then goes on to speculate on the development of civil society and the concept of culture, as he would again in his *Philosophy of Right*.[44] He discusses the Enlightenment as the embodiment of a false because anti-spiritual effort to build a truly universal society, and he introduces the almost current-events topic of the French Revolution and in particular the Terror of 1793–4 and the character of Robespierre as something of a *reductio ad absurdum* argument against the Enlightenment pretense of pure reason against the more humble security of traditional spirituality and community. And at this point Kant comes back into the dialectic, not Kant of the categorical imperative but the Kant who defended the religious "postulate" of "the moral worldview" and the grand teleology of the third *Critique*. According to Hegel, Kant had earlier argued for the importance of autonomy and his narrowly described notion of morality

only at a terrible cost, a one-sided picture of man as separated from nature and his own desires and happiness, concerned only with the imperatives of duty. Hegel now argues (as he had in his earlier writings) that morality and happiness cannot be separated: "enjoyment lies in the very principle of morality." Hegel thus restates what Kant called the *summum bonum* as a necessary condition for morality: "The harmony of morality and nature, or… the harmony of morality and happiness, is thought of as necessarily existing" (*PG,* 599). This "harmony of morality and objective nature" Hegel refers to as "the final purpose of the world" (*PG,* 604). Postulation, however, is not proof, and Kant's belief in a divine moral Legislator and the Kingdom of Heaven, his "postulates of practical reason," cannot be left to mere postulation. Thus the dialectical movement fron Kant's ethics to religion is an attempt to broaden the field of ethics and get away from Kant's overly restrictive notion of duty and the ultimately self-defeating distinction between duty and reason on the one hand and the inclinations, including both the moral sentiments and the pursuit of happiness, on the other. In the *Phenomenology,* as in his early writings, Hegel suggests that a more sophisticated and harmonious conception of morality can be found in *Sittlichkeit,* but now expanded to global and even cosmic proportions. After one final, unusually harsh attack on Kant, Hegel resurrects the early Christian ideal of conscience, in which, he argues (following Fichte), the commands of duty and the incentives of the inclinations are synthesized.[45] Conscience acts on implicit principle, yet it is also specific to particular situations. It is individual yet derivative of a person's upbringing in society. Conscience finds its living ideal in the figure that Hegel identifies as the "beautiful soul," a holy figure whose "pure goodness" makes them "lose contact with social reality." One immediately thinks of Dostoevsky's Prince Myshkin *(The Idiot),* or more aptly, it is the conception of the historical Jesus who best characterizes the beautiful soul and the perfect voice of conscience. It is the person of Jesus who moves the dialectic to that penultimate level of consciousness known as religion (*PG,* 632–71).

"The concept of Religion," according to Hegel, "is the consciousness that sees itself as Truth" (*PG,* 677). After a brief excursion through primitive and 'artistic' religious consciousness, Hegel brings us back to Christianity, whose Judaic origins have already promoted the conception of God as Spirit, but an objective or transcendent Spirit, "out there." What Christ represents, according to Hegel, is not a concrete manifestation of God in the form of one man. Christ is rather the symbol of the conception that God and all men are a unity. That spirit is "substance and subject as well" means that the Christian Spirit and we ourselves are the same (*PG,* 18, 748). Here is the resolution of the disharmony between man and God which had caused Hegel to renounce Christianity in his early writings, but it is not to be thought that this is an

unambiguous endorsement of traditional Christianity either. Christianity has failed to become Absolute Truth, according to Hegel, because it has become obsessed with figurative thinking in stories and pictures. To become Absolute Truth, Christianity must reject such thinking and become wholly conceptual. Needless to say, this entails a rejection of many of the teachings and most of the ritual storytelling of the Christian church. The Absolute Knowing of the *Phenomenology* can thus be interpreted as a reconceptualization of the basic themes of Christianity. But it is, apart from its trinitarian jargon, a notoriously weak vision of Christianity.[46] The insistence that Christianity become totally conceptual does not mean that it must dispense with any content, but its content is ultimately the content of the *Phenomenology* rather than the theological constructs that Hegel occasionally imitates but just as often lampoons. It has been said that the end and the purpose of the *Phenomenology* and the justification and end of all human activity rest in Hegel's revised Christianity, but, as Kierkegaard bitterly points out, this alleged Christianity is far more Hegelian than Christian. So, too, what Hegel means by "reason" may be no more than nominally related to what most philosophers designate by that term. The tricks and twists of the *Phenomenology,* not to mention its often impossible language, belie the claim that this is a work of, indeed the very embodiment of, reason. Nevertheless, it is a masterpiece of a very different kind, and philosophy would certainly never be the same without it.

CONCLUSION

Hegel intended his *Phenomenology* as the "introduction" to a system of philosophy. It was supposed to establish the standpoint of Absolute Knowledge from which the system itself could be formulated. That task occupied Hegel for the rest of his career. The conclusion always seems to be: We do experience Absolute Reality, but we conceive of it in many different ways and these various ways can be contrasted, compared, and fitted into a single, overall system of philosophy. Nietzsche later urged us to "look now through this window and now through that one," but where Nietzsche would insist (against Hegel) on the inevitable conflict and incommensurability of these various forms of experience, it is Hegel's project to show us how they grow from and complement one another as well as conflict. A sufficiently broad, indeed "absolute", perspective will absorb (which is not to say resolve) all of those conflicts as well.

19 Hegel, *Critique of Practical Reason; Religion within the Bounds of Reason Alone*.
20 Hegel, "Positivity" essay, op. cit., p. 68.
21 Hegel, "The Life of Jesus," also written in 1795.
22 A theme he clearly borrowed from Lessing's *Education of Mankind,* which he read in 1787 and again in 1793. See W.Kaufmann, *Hegel: A Re-examination* (New York: Doubleday, 1966), pp. 67f. Hegel, "The Spirit of Christianity and its Fate," op. cit., markedly shows this change of temper.
23 See also Hegel's fragment on "Love," in Knox, op. cit., pp. 302–8.
24 Hegel, "Positivity" essay, op. cit., pp. 185–7; Solomon, *In the Spirit of Hegel,* op. cit., pp. 142–3. Cf. Nietzsche's later argument in *On the Genealogy of Morals,* Book I, trans. W.Kaufmann (New York: Random House, 1967).
25 Quoted from Solomon, *In the Spirit of Hegel,* op. cit., pp. viii–ix. See also Leo Rauch's discussion of Hegel on "Spirit" in Chapter 8, "Hegel, Spirit, and Politics."
26 Quoted in Kaufmann, op. cit., p. 366.
27 *PG,* 16. Hegel denied making personal reference to Schelling in that comment and in a crack about "monochromatic" and "schematizing formalism" a bit later (*PG,* 51–2); but compare his only somewhat more diplomatic comments on Schelling in his later *Lectures on the History of Philosophy*. "His defeat is that the idea in general [is] not shown forth and developed through the concept *[Begriff],*" p. 242. He also distinguishes himself from Spinoza's pantheism—a dangerous position to be associated with in those days—in his *Encyclopedia,* op. cit., p. 573.
28 See my "Hegel's Concept of *Geist,*" in Solomon, *From Hegel to Existentialism,* op. cit., pp. 3–17.
29 See Leo Rauch, Chapter 8.
30 The "concept" is opposed to "intellectual intuition" and represents an argumentative or "dialectical" conception of philosophy compared to the emphasis on mystical insight that fascinated many of the romantic philosophers. Just after the publication of the *Phenomenology,* Schelling wrote to Hegel: "I confess that I do not comprehend the sense in which you oppose the *concept* to intuition. Surely you do not mean anything else by it than what you and I used to call the idea, whose nature it is to have one side which is concept and one from which it is intuition" (from Munich, 2 November 1807).
31 For Hege's mature notion of "the self-development of the concept," see Willem deVries's acount in Chapter 7, "Hegel's logic and philosophy of mind."
32 See Daniel Bonevac's discussion of Kant's first *Critique* in Chapter 2, "Kant's Copernican Revolution."

33 I have suggested elsewhere that one could begin the route traced in the *Phenomenology* at any number of different starting points and, presumably, cover much of the same territory and arrive at the same conclusion. Solomon, *In the Spirit of Hegel,* op. cit., ch. 4C, pp. 235ff.
34 One of the most outspoken advocates of this attack on epistemology today is Richard Rorty, who perhaps gives too little credit to Hegel in this regard. Despite his systematic pretensions, Hegel would seem to be a much more palatable ancestor than Heidegger, for example. See Rorty, *Philosophy and the Mirror of Nature* (Princeton: Princeton University Press, 1977).
35 Cf. Nietzsche, "How the True World' Finally Became a Fable," in *Twilight of the Idols,* trans. W.Kaufmann, *The Viking Portable Nietzsche* (New York: Viking, 1954), pp. 485f
36 Again, see Daniel Bonevac's chapter on the first *Critique,* Chapter 2.
37 Kant, *Prolegomena to Any Future Metaphysics* (Indianapolis: Bobbs-Merrill, 1950), p. 66.
38 An extended discussion of this empty self-reference can be found in Part III of the *Encyclopedia,* op. cit.
39 This conception of the individual as essentially independent but limited by others cornes to Hegel from Jean-Jacques Rousseau, who influenced Hegel in many ways as much as he influenced Kant.

CHAPTER 7

Hegel's logic and philosophy of mind

Willem deVries

LOGIC AND MIND IN HEGEL'S PHILOSOPHY

Hegel is above all a systematic philosopher. Awe-inspiring in its scope, his philosophy left no subject untouched. Logic provides the central, unifying framework as well as the general methodology of his system. Understanding Hegel's logic is therefore essential to a comprehensive understanding of any piece of the system and any subject it deals with.

Hegel never slavishly accepted received wisdom in any field and less so in logic than anywhere else. The philosophical revolution began by Kant demanded a thoroughgoing reconception of the purpose, method, and content of logic, Hegel believed, and his expositions of this newly reconstituted discipline in the *Science of Logic* and the *Encyclopedia of the Philosophical Sciences* remain among the most intractable works of the philosophical canon. Hegel's logic breaks radically from the Aristotelian and scholastic logic that had dominated previous philosophical speculation, and it is unrelated to the mathematical logic that began to develop soon after Hegel's demise. The primary focus of this essay will be on what Hegelian logic is about, rather than on the details of its execution.

In the first section the essential problem of Hegel's logic is introduced, viz., that logic, according to Hegel, cannot be a purely formal discipline. The second section summarizes the textual development of Hegel's logic. The third section establishes the parameters constraining the

interpretation of Hegel's logic. Because of the obscurity of the texts, it is valuable to state explicitly the conditions that constrain an adequate interpretation. Succeeding sections address these conditions by showing what it means that Hegel's logic is a self-movement of the concept and how this relates to his theory of subjectivity (the fourth section), in what sense logic is a formal science for Hegel (the fifth section), how one begins the enterprise of logic (the sixth section), and why Hegel's logic exhibits such a particular structure (the seventh section).

The paramount importance of logic within Hegel's system cannot be denied. A relatively large proportion (over 30 per cent) of his written work is devoted to logic: Of the four books Hegel published, one (the largest) is solely devoted to logic, and it is that book Hegel wrote in order to make his mark in the philosophical world after his first book, the *Phenomenology of Spirit,* garnered little notice. One-third of the *Encyclopedia* is devoted to logic. More importantly, Hegel's system begins with logic and culminates by returning to the point of departure for logic; logic is the alpha and omega of the system. Logic provides the alphabet for the system as well, for the conceptual analyses provided by logic serve as the patterns for the rest of the system. Logic is also the discipline in which Hegel's methodology is explicitly thematized. The idea that there is a "dialectical method" that can be illuminatingly brought to bear on any subject matter has fascinated post-Hegelian thought. (What this method is, however, has been notoriously difficult to specify.) Hegel's logic remains the primary source for any understanding of dialectics.

Logic plays such an important role in Hegel's philosophy, in part, because of his revolutionary interpretation of the discipline. Traditionally, logic has been understood as the study of the *formal* conditions of truth or as the study of the laws of thought. As the study of the formal conditions of truth, logic pays no attention at all to the *contents* of the items it addresses.[1] But Hegel rejects this interpretation of logic, arguing, in effect, that truth is both the subject and content of logic, and that logic cannot be a purely formal enterprise, for the notion of truth is not and cannot be a purely formal notion. If truth is the agreement of thought (or language) with reality, there is no guarantee that there must be certain conditions that thought or language on their own must satisfy in order to be able to agree with reality.[2] The conditions for the possible agreement between thought and reality or concept and object must depend in part on reality (see e.g. *WL,* I:25; *SL,* 44–5).[3] But, then, they cannot be purely formal.

Hegel also picks up on the ancient theme that logic is the science of the laws of thought and infers that "as thinking and the rules of thinking are supposed to be the subject matter of logic, these directly constitute its peculiar content; in them, logic has that second constituent, a matter, about the nature of which it is concerned" (*WL,* I:24; *SL,* 44). Whether

the connection to truth or the connection to thought is emphasized in understanding the nature of logic, Hegel concludes that logic cannot be a purely formal enterprise. Since logic concerns the fundamental conditions of truth and thought and these cannot be specified independently of their content, the fundamental structures of reality, logic merges with basic metaphysics in Hegel's system.

The hope to derive metaphysics from logic is not peculiar to Hegel by any means—besides Hegel's predecessors (Leibniz and Kant, in particular), the twentieth-century logical atomists (Russell and early Wittgenstein), who in most other ways were Hegel's antithesis, also sought to read their metaphysics off of their logic. The logic-metaphysics connection acquires still further weight in Hegel's system from his idealism. Idealism is a tricky "ism" because so many different theories have gone by that rubric. Hegel's version, *absolute* idealism, must be distinguished from Berkeleyan subjective idealism (the claim that material bodies do not exist and the only things that do exist are mental substances and their modifications), what Kant calls Cartesian "problematical" idealism (the claim that the only things we know for certain are our own mental states, all other knowledge being a probabilistic inference therefrom), and Kantian transcendental idealism (the claim that our knowledge is restricted to things as they appear to us given our forms of intuition and that things as they are in themselves can never be known). Some versions of idealism thus have metaphysical theses at the core, while others are grounded in epistemological theses.

Absolute idealism is principally a metaphysical position characterizable as the claim that mind and reality share the same categorical structure. The categorical structure of thought ("thinking and the rules of thinking"), which is the subject matter of logic, must also be, according to the absolute idealist, the categorical (read here "ontological") structure of reality, and thus logic *is* metaphysics. Hegel's epistemology, in contrast to his metaphysics, is fundamentally realist and committed to our ability to cognize the objective structure of reality, although it is complicated by a sophisticated understanding of the historical conditions of knowledge.

Without looking in greater detail at the arguments Hegel gives to back up his claims, it is hard to grasp his points fully, but one immediate warning is warranted in this introductory glimpse of his position. Do not confuse mind (spirit) with minds. Hegel's German term *Geist*, formerly translated as "mind" but now increasingly translated as "spirit," can apply to individual minds, in which case Hegel would talk of *subjective* spirit. This is the usage that is most like our contemporary use. Hegel has a specific section of the *Encyclopedia,* called the "Philosophy of subjective spirit," focused on problems in philosophy of psychology. But *Geist* or spirit can also apply more broadly. Hegel generalized the Kantian notion that the self (the

transcendental ego) is a principle uniting a disparate manifold of sense impressions into the notion that *Geist* is a principle uniting the disparate manifold of natural and historical events. Schematically:

> Kant's transcendental ego: phenomenal world::
> Hegel's absolute spirit: the world

This vast oversimplification leaves at least two important questions: What happens to the Kantian thing-in-itself in Hegel's version? And what is the relation between subjective spirits and absolute spirit for Hegel? Let me briefly address the second question here; we will return to both questions later. Individual minds *embody* spirit; they are necessary to and participate in the development of absolute spirit, but no individual mind is itself essential to spirit's self-realization.

The movement and development of absolute spirit constitutes a higher level of abstraction than the psychological or historical development of individual people or societies. It is at this very high level of abstraction that we can describe pure thought. Logic is therefore not concerned with the thinking of any individual—that would make it psychology—nor with the "rules of thinking" governing any particular culture, period, or discipline.

> Logic is to be understood as the system of pure reason, as the realm of pure thought. This realm is truth as it is without veil and in its own absolute nature. It can therefore be said that this content is the exposition of God as he is in his eternal essence before the creation of nature and a finite mind.
>
> (*WL*, I:31; *SL*, 50)

DEVELOPMENTAL HISTORY OF HEGEL'S LOGIC

This essay does not purport to trace the development of Hegel's logic (a study which is yet to be written), but here a few landmarks may help orient one within the somewhat idiosyncratic world of Hegel's thought. Hegel's earliest philosophical speculations center around issues in ethics and the philosophy of religion—in particular Hegel seeks to understand how it might be possible to reconcile the oppositions that he felt characterized modern life: the oppositions, e.g. between reason and faith, society and individual, universal and particular. In his earliest writings (1795–1801), Hegel believes philosophy cannot itself escape the

contradictions of such finite oppositions, for it remains trapped within them. Philosophy can at best lead us to see their inadequacy; religion alone can take us beyond them.

In Hegel's Jena period (1800–7) philosophy gains ascendancy over religion as the field in which the sought-for resolution of the tensions and oppositions of the modern world can be found. Nevertheless, during most of this period at least, Hegel thinks of logic and metaphysics as an *introduction* to philosophical speculation, not yet an essential *part* of it. The principal problem governing Hegel's thinking in Jena is that of overcoming the subject-object opposition. Hegel assumes that beneath the apparent opposition there is an underlying unity that takes on different forms in each of the opposed concepts. Speculative philosophy itself is the consideration of this unity and its various forms. Logic and metaphysics are preliminaries: In logic and metaphysics the fixed oppositions in terms of which we normally understand the world are shown to self-destruct. This destruction of the concepts of the understanding should then liberate us from the rigid categories that make resolution of the conflicts of modern life impossible (the task of logic) and, according to Hegel, also establish the Absolute, the unity underlying all oppositions, as the principle of all philosophy (the task of metaphysics). After the ground is cleared by logic and metaphysics, philosophy proper—the philosophy of the object, the philosophy of the subject, and the philosophy of the Absolute—can begin.

Unfortunately, little of the material in which Hegel works out his conception of logic and metaphysics at this time has survived. Yet one of the most important changes in Hegel's development is the shift in his understanding of the nature and place of logic and metaphysics that occurs toward the end of the Jena period (*c*. 1805–6). During this period Hegel ceases to distinguish between logic, metaphysics, and speculative philosophy. Briefly, Hegel seems to have discovered the idea that the formal structure of self-consciousness provides a model in which the conceptual oppositions of logic as well as the phenomena of nature and the social world can be treated in a unified, meaningful manner. Logic is the science of pure, self-conscious thought, and is therefore an essential part of the new system. In the light of this new conception Hegel adds a new kind of introduction to the system, the massive *Phenomenology of Spirit*, published in 1807, in which he traces the different forms consciousness and self-consciousness may take, culminating in the pure self-consciousness that is both the subject and object of logic.

The *Phenomenology of Spirit* was finished, as the story goes, with the battle of Jena booming in the distance. Subsequent to Napoleon's defeat of the Prussian army at Jena, the university was shut down, and Hegel had to go looking for employment, spending the next year as editor of a

newspaper in Bamberg before accepting a post as the rector of a *Gymnasium* (a college-preparatory academy) in Nuremburg.

During his time in Nuremberg the Hegelian system, especially the logic,[4] as we now know it really took shape. The first installment of his *Science of Logic* (the so-called objective logic) was published in two volumes, the Doctrine of Being in 1812 and the Doctrine of Essence in 1813. The second installment (the subjective logic) containing the "Doctrine of the Concept" was published in 1816, the year Hegel was called to a chair at the University of Heidelberg. Hegel needed a text for his students in Heidelberg, so he put together the first edition of his *Encyclopedia of the Philosophical Sciences*. This contained a brief outline of his entire philosophical system and was intended only as an aid to those attending his lectures, orienting them within his system.

Hegel was called to Berlin, the leading university of Prussia, in 1818. He was to become the dominant figure in German philosophy during the subsequent decade. He published his last book, the *Philosophy of Right*, in 1821; he began another on the philosophy of subjective spirit, but never completed it. The second edition of the *Encyclopedia* appeared in 1827. Only a few years later, he revised the *Encyclopedia* yet once more, its third edition appearing in 1831. By 1826 the original copies of the *Science of Logic* were sold out, and the printer suggested reprinting the work. Hegel, however, decided to rework the book. The new version of the Doctrine of Being was given to the printer in 1831, the new preface dated 7 November 1831. A week later, on 14 November 1831, Hegel died of cholera.

After Hegel's death a group of Hegel's students, calling themselves the Society of Friends of the Eternalized, undertook to publish a complete edition of Hegel's philosophy. Their edition of the *Science of Logic* combined the newly revised version of the first third with the older, still unrevised remainder. Thus the first third of the *Science of Logic* as it has come down to us was written almost a decade and a half after the rest of the book. In the posthumous edition of the *Encyclopedia* the editors decided that it was too cryptic in the form Hegel gave it and therefore added supplementary additions *(Zusätze)* drawn from both Hegel's own and students' lecture notes. Most of the original notes have since been lost, so there is some question about the authenticity of some of this additional material, but the *Zusätze* have been a part of the Hegelian corpus since shortly after his death and can provide a valuable perspective on the argument of the text.

In the new, critical edition of Hegel's texts currently in preparation, both versions of the *Science of Logic's* first part are available, as will be much more reliable editions of the notebook material utilized by Hegel's various editors in compiling *Zusätze* and lectures.

ADEQUACY CONDITIONS ON INTERPRETATIONS OF HEGEL'S LOGIC

Since the texts of Hegel's logic are among the most difficult in the philosophical corpus, it is not surprising that there is a wide variation in the interpretations that have been offered and that no school of interpretation is currently dominant. The salient aspects of Hegel's logic that any interpretation must account for fall into two categories, the structural and the testimonial. Any adequate interpretation must account for the place of logic within the Hegelian system, the general structure exhibited by Hegel's logic, and the particular transitions found in it. Further, any adequate interpretation of Hegel's logic must also account for Hegel's own pronouncements about its scope, content, and method. An interpretation that gave a detailed, sensible account of the progress of the argument in the logic would be powerful and very valuable—but if it could not be made consistent with Hegel's own testimony, it would always face skepticism. It seems clear, however, that Hegel's practice in the logic does not always coincide with his preaching; every interpretation of Hegel's logic will have to construct a fine balance between the structural and testimonial evidence.

Structural conditions on interpretations

What role does Hegel's logic play in the system? The system consists of three parts: Logic, Philosophy of Nature, and Philosophy of Spirit. Hegel tells us that his system is a "circle of circles," so this is not merely a linear ordering. At the end of the Philosophy of Spirit we are to be in a position to begin again with the logic in some manner. Logic, therefore, is both the antecedent and the product of spirit. Other puzzling questions quickly arise in trying to understand this triad: The Philosophies of Nature and Spirit concern items within our experience that occupy space and time, but logic seems concerned with things of quite a different stripe. Just what is the relation between the logical realm and the realms of nature and spirit?

Next, the internal structure of Hegel's logic must be accounted for by any acceptable interpretation. It is instructive to look at the arrangement of topics in the logic to get a sense of what an interpretation must cope with. Hegel's logic appears to have a very rigid hierarchical organization. An interpretation that accounts for the gross structural organization may have difficulty with the fine structural detail of the system, and two different interpretations may be able to penetrate the fine detail better in

different areas of the logic. Appended to this essay is an outline of the system as found in the *Science of Logic* (in the hybrid edition).

Several features of the logic immediately leap to the eye. Virtually everything is grouped in triads. The only exceptions are: (a) there are four groups of judgments at the fourth level under III.A.2 (see Appendix, pp. 246–7), and (b) the Idea of Cognition has only two subheadings, the Ideas of the True (which itself has only two subheadings, Analytic and Synthetic Cognition) and the Good. This triadicity is not a mere artifact of compulsive German orderliness; it is supposed to be a necessary consequence of the method of logic that generates the outline. But why, then, does it have *any* exceptions?

Several of the titles are repeated. Thus, Being is both heading I, heading I.A.I., and heading I.A.I.a; Appearance is both heading II.B and heading II.B.2. How can the same topic or concept appear at several places in the hierarchy? Other than the triad Concept, Judgment, Syllogism under III.A, most of the concepts have apparently very little to do with logic as standardly understood, then or now. Most of them are, however, connected with classical problems of metaphysics.

It is also notable that the relations among the concepts dealt with in each of the three main divisions differ. In the Doctrine of Being the concepts within a triad tend to be contrastive and mutually exclusive; in the Doctrine of Essence they tend to come in coordinate pairs, both of which can be applied to an object; in the Doctrine of the Concept the successor concepts are supposed to retain and contain their predecessors. Or at least Hegel tells us that there are such structural changes within the Logic, and on the whole his assertion seems borne out.

Testimonial conditions on adequacy

Any fully adequate interpretation will have to take account of what Hegel says about his Logic, its purpose, its method, and its achievement. We have already seen some of Hegel's own interpretation: that his logic is about thinking and the rules of thinking, that it constitutes the system of pure reason, truth in its own nature, and, more obscurely, that it is an exposition of "God as he is in his eternal essence."[5] Hegel's logic, while both logic and metaphysics, is a theology as well. According to Hegel religion and philosophy share the same content—the Absolute. In religion this content is couched in an imagistic form that is not fully adequate to the content itself; it is only in philosophy that this content receives a form adequate to itself. Thus we should expect a mapping between the truths developed within logic and the images and stories found in religion such

that logic reveals the full message embodied obscurely in the mythology of religion.[6] Christianity may be the highest form of religion, the form in which the content can, given the limitations of the imagistic presentation, most fully express itself, but every religion has at heart the one true content, the Absolute.

Undoubtedly the most difficult problems in interpreting Hegel are generated by his pronouncements about the *method* of the logic. For his method is no method at all: What we have before us in the logic is *the self-movement of the concept*. That is, Hegel rejects the idea that in philosophy there is one thing, a method, that is applied to a separate thing, a content. The logic traces out what is contained in its content, and it does that not by applying some externally definable, content-independent method to produce a result, but by allowing the content to unfold itself. There is no "dialectical method," despite its supposed practice by so many of Hegel's followers. But then just how is the elaborate structure of the logic generated?

While Hegel's logic is not in any normal sense a formal logic, Hegel does claim that it is a formal science in the sense that it is the science *of* form. What does this mean? Hegel attacks the form/content distinction, but he does not simply reject that distinction as either senseless or even necessarily confused: What he objects to is the notion that form and content are absolutely separable and autonomous elements of a whole. No form and no content are *pure*. Instead, Hegel believes form and content are necessarily correlative; some forms are best suited for some contents but not others, and vice versa. Hegel constantly distinguishes the formal aspects of phenomena from their particular contents—that is, in part, what the philosophies of nature and spirit are all about—but what kinds of forms are available and how they relate to each other simply as forms are matters for logical analysis. In the logic as a whole, form *is* its content, and this content dictates its form.

Logic must also be a presuppositionless science, according to Hegel. This is a fundamental distinction between logic and all other scientific disciplines. Other scientific disciplines must presuppose some particular, independent subject matter; to this subject they bring some method or procedure. In neither case is the justification of these presuppositions a problem within that discipline. "Logic, on the contrary, cannot presuppose any of these forms of reflection and laws of thinking, for these constitute part of its own content and have first to be established within the science" (*WL*, I:23; *SL*, 43).

Let me summarize the set of adequacy conditions for an interpretation of the logic delimited here. These conditions are not exhaustive; the logic is an extremely rich and perplexing text. But an interpretation that can meet these conditions will have a good chance of responding to other challenges as well.

1 Any interpretation must explain the sense in which the logic is the self-movement of the concept and the implications of this for its methodology.
2 Any interpretation must explain how the logic is the science of form.
3 Any interpretation must be able to explain the relation between the Logic and the Philosophies of Nature and Spirit. It should also explain the logic's relation to the *Phenomenology of Spirit,* which was proposed to be an introduction to the logic.
4 Any interpretation must explain the presuppositionlessness of the logic and how such a presuppositionless science can get started.
5 Any interpretation will have to account for the internal structure of the logic:
   (a) Triadicity.
   (b) Repetition of titles.
   (c) Differences between types of concepts in the three parts of the logic.
   (d) A detailed reconstruction of the particular arguments and transitions found in the texts.
6 Any interpretation must explain the relation between logic and God.

THE SELF-MOVEMENT OF THE CONCEPT

The concept

Understanding Hegel's claim that logic is simply the self-movement of the concept requires understanding the particular meanings Hegel gives the terms of that dictum. Hegel has quite a particular notion of a *concept,* which is central to his whole system. Of course, Hegel's notion of a concept is heir to a significant history, and much can be revealed by tracing its roots in the philosophical tradition. While there is little space here for such development, a few allusions may help situate the discussion.

Hegel's logic, like that of his predecessors, is a logic of terms and concepts, not a logic of relations between sentences and operations upon sentences. The modern logician begins by specifying a syntax, that is, a vocabulary and rules of sentence formation. These initial steps are followed by specifying a proof theory and then a semantics. Thus, if the modern logician thinks of the syntax, the vocabulary and formation rules for the system, as the preliminary set-up, the actual beginning would most likely be a set of axioms or fundamental truths. One way in which Hegel

differs is that he expects logic to develop a system of relations among concepts, not a system of relations among sentence forms. Aristotelian logic provides very few sentence forms and no system by which to generate arbitrarily complex new forms. What flexibility Aristotelian logic affords, by which it can be applied to a relatively broad range of sentences and arguments, comes from our ability to formulate arbitrarily complex concepts to use within the sparse syntax provided. Hegel therefore focuses his logic on the forms of concepts, not the forms of sentences. So he looks to begin with a fundamental, simple, immediate, unstructured concept—the simplest form a concept can take—and end with the all-inclusive, absolutely self-constituting concept, the Idea. Just as the early Wittgenstein sought the general form of a proposition, Hegel seeks the general form of a concept.

The historical background for Hegel's notion of a concept properly begins with Plato's notion of a separable form *(eidos),* a universal in which any number of sensible things can participate. This notion was then transmuted by Aristotle into a form immanent in the sensible object that shared it and necessarily embodied in an appropriate kind of matter. The most important fact about these classical Greek speculations is that both considered their concept-precursors, the forms, to be *objective* features of the world graspable by human reason. The skeptical attacks of Hellenistic philosophy coupled with the rise of Christian metaphysics forced these objective universals inside the mind; they were saved from complete subjectivity only because they could be located in the mind of God, who created the world in accordance with his divine plan. But the mind of God itself became more and more distant as the Middle Ages wore on, and by the time modern philosophy came on the scene only such patently inadequate ruses as Cartesian innate ideas guaranteed by a beneficent but ultimately unknowable God protected universals from complete entrapment in subjectivity. In the subjective idealism of the empiricists this development reached its sorry nadir.[7]

Kant began the climb out of the subjectivist coal pit when he reasserted the objectivity of certain universal concepts on the grounds that they are necessary constitutive conditions of thought itself. Such concepts are objective because without them thought could have no *object* at all. But Kantian concepts are limited to the material of sensuous intuition; *substance, cause*, and other *a priori* concepts objectively characterize phenomenal objects, but have no application beyond the bounds of sense. Our concepts do not apply to things as they are in themselves.

Kant falls back into a subjectivist skepticism despite his valiant effort to climb out (e.g. *Enz. [Encyclopedia],* §§ 40–5). Hegel is quite convinced that any "knowledge" that is not of the object as it is in itself is not *knowledge* at all. Hegelian concepts, like those of the great classical

thinkers, must be objective, humanly graspable features of things as they are in themselves (*Enz.*, §§ 19–25). In order to develop and defend his idea of a concept, however, Hegel must demonstrate how finite, sensuous intelligences like ours can grasp such objective features of our world: He must develop both an ontology and an epistemology. The general outlines of both his ontology and his epistemology emerge from Hegel's rejection of the possibility of a purely formal logic together with the constraints he believes govern any adequate theory of thinking. As a first step toward climbing out of the subjectivism Hegel thinks besets modern philosophy, let us develop the Hegelian theory of subjectivity, for only an adequate theory of subjectivity can demonstrate that we are not trapped in our own minds with no access to the world.

Logic as a theory of subjectivity

A full theory of subjectivity must account for all the phenomena of mind: sensation, feeling, perceiving, thinking, desiring, willing, etc. It would be a mistake, however, to think that the Hegelian theory of subjectivity is essentially a theory of *human* subjectivity. Human subjectivity is distinguishable from the pure thinking thematized in the logic in that it is still beset with the contingent, variable structures of sensation, feeling, desiring, etc. Pure thinking is abstracted from such contingencies. Here we will reconstruct the theory of pure thinking, for this is also the content of Hegel's logic. There are two constraints that any adequate theory of thinking must observe: First, the Kantian transcendental unity of apperception, the fact that the 'I think' must be able to accompany all my representations.[8]

Kant was always unclear about the exact status of the 'I think'—to this day his commentators wrangle about it—but it is at least clear that the 'I think' that occurs in the principle of the transcendental unity of apperception cannot, on Kantian principles, itself be a piece of objective knowledge. Objective knowledge requires application of a schematized category of thought to the sensuous content of intuition, and the transcendental unity of apperception is an analytic principle not based in any way on sensuous intuition. Kant, therefore, cannot justify his belief that he thinks. Hegel could not accept the notion that our self-reflection is in a substantially worse position than our other knowledge, and is furthermore unwilling to draw the distinctions in kind between, on the one hand, transcendental 'knowledge' of the form of experience and the role of the unity of apperception and, on the other hand, objective knowledge of items within our experience.

The second constraint on the theory of thinking is that the 'I think'

expresses an objective cognition. In this sense Hegel reasserts the Cartesian *cogito*.[9] These two constraints jointly require thought to be capable of objective self-reflection.

Hegel's theory of thinking is logic itself. In what sense logic is a theory of thinking, however, needs further clarification, for a thoroughgoing empiricist such as J.S.Mill might agree with this and conclude that logic must itself be an empirical discipline, though admittedly at a very high level of abstraction. Hegel is certainly not an empiricist, though the extent to which his system accommodates the empirical has generally not been well enough recognized. Nor is Hegel's logic itself psychologized, for it is a mistake to assume that *thinking* is solely an activity of human subjects. Psychology is a particular discipline handled within the system at its appropriate place. But *thinking* is the activity of the universal, the concept itself.

If the psychological process of thinking is not what provides logic with its content, then in what sense is thinking the content of logic? Kant distinguishes between general logic—a formal discipline that concerns the conditions of thought in general, regardless of its object—and *transcendental* logic—the discipline concerned with the *a priori* conditions of thinking about objects of our sensibility (objects located in space and time). General logic must be purely syntactic, but transcendental logic has an irreducible semantic component, for it must deal with the conditions of reference to spatio-temporal objects. Kant's table of categories, the list of those *a priori* concepts he thinks structure our abilities to think and know about the sensible world, is a product of transcendental logic, the analysis of the *a priori* conditions for applying the forms of judgment to spatio-temporal objects.

Hegel maintains, in effect, that the syntax/semantics distinction Kant presupposes to separate general and transcendental logic cannot be sustained.[10] Syntax is always contaminated with semantic content precisely because syntax's role is to subserve a semantic purpose: the embodiment of *truth*. The hope of analyzing out of language or thought a pure logical syntax without any metaphysical implications about the nature of objects is a pipe dream, or worse, a delusion. Even the bare subject/predicate distinction constrains our metaphysics; it is no accident that a traditional definition of 'substance' is the *ultimate subject of predication*. Again, *noun* is usually supposed to be a syntactic category, but its classical definition, "name of a person, place, or thing," is given semantically. In fact it is impossible to give a nontrivial but general, purely syntactic characterization of the nouns, verbs, etc. of any natural language.

For Kant, pure (unschematized) thought has no intrinsic relation to anything; it is, as it were, merely the form of relatedness to an object.

Actual relation to objects is the business of another and separate faculty of mind, sensibility. Hegel responds that thought must have, intrinsically, a relation to itself—that, as he sees it, is the point of Kant's transcendental unity of apperception. And this relation is capable of sustaining a knowledge-claim; that is the point of the *cogito*. The *cogito* does not express a piece of sensory knowledge, according to Hegel; neither does it express a direct nonsensory intuition of a thinglike existent. The self or I is itself a *concept* in Hegel's special sense of that term.[11] The *cogito* expresses a recognition and preliminary understanding of that concept, an understanding that *presupposes* a good deal of sensory knowledge, but cannot be *reduced* to such sensory knowledge. Since the 'I think' does not itself *contain* distinctively sensory knowledge, Hegel sees it as purified of such sensory content, as having left the sensory realm behind. Thus, although he rejects the Kantian notion of a pure reason entirely and in principle divorced from sensibility, Hegel recovers a notion of pure reason by postulating a form of thought and knowledge that rises above the sensory to achieve independence of any and all particular sensory contents.

Reason necessarily goes beyond sense, but the *cogito* shows that it does not thereby lose either its object of its objectivity. It therefore cannot be the case that all relation of thought to its object is the business of an entirely separate, nonrational faculty of mind. Since not *all* relation to objects is directly mediated by sensibility, sensibility is no longer the universal limitation on all thought. Thus for Hegel the distinctions Kant relied on to separate general and transcendental logic have evaporated, and the conclusion must be that all logic has a transcendental component and thus merges into metaphysics.

Bluntly put, since thought must be capable of self-relation, the conditions necessary to that self-relation are conditions on all thought. Some objects we may relate to through sensation, but the thinking that relates to them must still belong to a structure of thought capable of pure (nonsensuous), objective self-relation. The *cogito* shows the reality of this self-relation of thought to itself, but the lesson of the *cogito* goes beyond a mere ability of thought to *refer* to itself: It shows that thought must be capable of *knowing* itself. Hegel would *not* claim that the *cogito* itself contains or expresses such self-knowledge of thinking by thinking, but he does believe that he can demonstrate that the self-reference of thought to thought contained in the *cogito* is itself possible only if thought is also capable of complete self-comprehension. (This is a major result of the *Phenomenology of Spirit*.) The reality of the self-related structure of thought demands closure. The self-related structure of thought is the topic for logic.

Thus Hegel's logic is at the same time an implicit theory of subjectivity, of what kind of structure is necessary in order for thinking to comprehend

itself.[12] The self-comprehension of thought requires a comprehension of the object of thought and thought's relation to that object, for, as we have seen, thought cannot be characterized in an entirely self-contained, purely syntactic way. In completely characterizing itself, thought must also completely characterize its range of possible objects, and there can be no remainder, no things-in-themselves left over outside the structure of thought. The structures revealed by the self-comprehension of thought include necessarily the structures of all objects of thought as well; an object that is not a possible object of thought is nothing at all. But what the logic does not itself directly consider are the ways in which thought structures are embodied in the world. The rest of Hegel's philosophy deals with this, for thought structures are embodied in nature (thus the philosophy of nature), in social structures (thus the philosophy of objective spirit), in the expressive products of human activity (thus the philosophy of absolute spirit), and, of course, in the psyches of individual organisms. It is the task of the philosophy of subjective spirit to discuss how it is possible for an individual animal organism to embody within itself the structures definitive of thinking. Needless to say, the complex organization requisite to embodying a self-comprehending structure of thought imposes significant constraints on the nature and capacities of such an organism. But for our purposes it is more important to see that Hegel does not believe that the embodiment of the structures constitutive of thought is confined solely to individual animal organisms: The world as a whole also embodies these structures. In order to see why Hegel thinks this is necessary and how he believes it to be possible, we need to look more closely at his ontology.

The active concrete universal[13]

Hegel believes that most of his predecessors chose the wrong paradigm of predication. These philosophers—philosophers trapped in the "attitude of the understanding"[14] according to Hegel—took accidental predications (e.g. "The ball is red") as paradigmatic. In such a case there is no intrinsic connection between the universal and the individual it is predicated of; both the universal and the individual seem quite indifferent to each other. Taking this to be the paradigmatic predication relation, Hegel believes, leads to a metaphysics in which the world is seen as composed of a nexus of bare particulars (in his terminology *abstract individuals*) and ontologically independent universals (he would call these *abstract universals*). Hegel thinks such a metaphysics impossible; to escape being trapped in it one must reject both the abstract individual and the abstract universal.[15]

In the place of accidental predication Hegel substitutes a version of

essential predication, for in an essential predication the universal and the individual are intrinsically tied. The essence of something is also seen by Hegel to have some explanatory power; saying of what kind a thing is can be a legitimate explanatory move. In Hegel's view an essence, something's concept, is not a *descriptive* characterization, but a *prescriptive* ideal, and it plays a role in a ideological explanation. Something's concept offers an ideal pattern which the thing strives to realize in the course of its existence, though individual things are never perfect exemplars of their essence. In this respect we can begin to see a rather strange melding of Aristotle's concept of an essence with the Kantian notion of a concept. Kant insisted that "a concept is always, as regards its form, something universal which serves as a rule" (*Critique of Pure Reason*, A 107). Hegel seizes on three aspects of Kant's *a priori* concepts—their unrestricted universality, their prescriptive force, and their conceptual priority over their instances—and transfers these properties to the basically Aristotelian conception of an essence or thing-kind.

Hegel also learned from Kant that concepts are not discrete entities that exist and can be known each independent of any others; neither thinker employs the notion of a *simple* concept. We can say that Hegel took over from Kant a coherence theory of concepts: Even bottom-level basic ideas are to be understood through their interaction with other ideas in basic principles, in contrastive relationships, and so forth. Hegel is committed to a more thoroughgoing holism of concepts than Kant, for he cannot distinguish absolutely between formal and material representations. Perhaps most important, the crucial relationships between concepts need not all be construed as analytic 'inclusions': Kant inaugurated the search for nonanalytic but also non-psychological, rational connections between concepts, and Hegel willingly followed. Thus, what Hegel calls a *concept* is a prescriptive ideal that is part of a system of such ideals that the world is striving to realize and in terms of which we can make sense of what happens in the world.

However, Hegel takes the rulelike character and implicit systematicity of concepts so seriously that he made a move Kant would never have dreamed of making. Hegel insisted that the being of the T is the being of a concept, for the T is the rule for the unification of all experience. The unity of apperception is the ideal governing all synthetic activity in the mind. Indeed, since the T provides the ultimate rule—all concepts must be unified under the 'I,' including the pure concepts—the 'I,' the self, becomes a superconcept, a concept of concepts, *the* concept (*WL*, II: 220–1; *SL*, 583). Thus the *cogito* becomes the first and immediate expression of the self-directed, self-organizing activity of the concept. The T or self is not a thinglike substance, but a conceptlike self-organizing activity.

Every universal of whatever kind unifies something, but in contrast to

abstract universals like 'red,' concrete universals like 'dog' or 'thinker' not only unite various different individuals under some heading but also account for their internal unity. The model for this internal unification is the synthesis of the manifold into the unity of apperception. The manifold is unified, according to the Kantian vision, because I make it mine, constituting myself in that very process. Hegel attributes this kind of self-constituting activity to every concrete universal, to all concepts. Any unity of a manifold that is not thus actively involved in the very nature of the elements, while also constituting its own self in the activity, is to that degree a merely abstract universal. A concrete universal is therefore different from the *abstract* universals that previous thinkers in the classical tradition took to be the objects of thought.

> The universal of the concept is not a mere sum of features common to several things, confronted by a particular which enjoys an existence on its own. It is, on the contrary, self-particularizing or self-specifying, and with undimmed clearness finds itself at home in this antithesis.
>
> (*Enz*., § 163; my translation)

An abstract universal is a tag which can be hung on things otherwise quite indifferent to it in order to sort them out for whatever purposes one may have. A concrete universal, on the other hand, divides nature at the joints; it must reach to the very hearts of things and afford an understanding of their being. An abstract universal is static and unchanging because it is dead, a mere sum of otherwise unrelated features. A concrete universal, a concept, however, is alive, dynamic, and dialectical; it is essentially a part of a self-developing system.[16]

In sum, the foremost characteristic of a concept is that it is *active*. Thus Hegel explains the stability of the world, the fact that the world is not a sheer, unstructured chaos, by the activity of *concrete* universals. The manifold unified by these concepts is not itself entirely separate from them in nature, provided from the outside, but must itself be of some determinate kind and therefore itself already conceptualized. Thus there is a complex structure of interrelated concepts, a structure that is not built up from the outside by some external agency, but develops its own organization from within. Its mode of action is teleological, that is, it is self-realization. The concept is both cause and effect; it is self-developing. Second, a concept is the *truth* of those objects it characterizes and animates. It is their essence, that which explains what they are and why they have the unity they do. Third, a concept is not separable from its instances, but actively manifests itself in and through them. Fourth, concepts have an essence of their own, *the* concept, which realizes itself in the active self-realization of its contributory moments. Concepts are

essentially parts of a self-realizing system. What ultimately is, according to Hegel, is a universal self-constitutive activity that becomes self-conscious in man's knowledge of it—the Absolute.

The self-movement of the concept

In Hegel's vision this universal self-constitutive activity expresses itself in the world via the articulation of nature into different orders of entities and properties. But the expression of the Absolute in nature is itself static; the movement and change within nature are but a pale reflection of the dynamic self-activity of the Absolute, for nature itself is ahistorical, it does not *develop*, but simply changes endlessly. It is in the realm of spirit that this universal self-constitutive activity expresses itself adequately, both as historical development across the human, spiritual community and as the individual development of a thinker's thought in contemplation.

Subjectivism is no longer a problem, Hegel thinks, because the active concrete universals that structure and inform the world are one and the same as the structures that animate subjective thought (when it has freed itself from the strictures of sense and understanding). One and the same rule system governs both thought and the world. That structure is reason itself, and it is *grasped* by individual minds through their instantiating the structure of rules in a self-conscious way.

All this grand talk of self-constituting activities can still, however, leave one dissatisfied, convinced that the fundamental questions still remain: In the self-movement of the concept, just *what* is moving, and how? We have seen that concepts are items in a complex, self-developing system and that this system is itself supposed to be a concept. It is easy to get the impression that this is a case of pulling oneself up by one's own bootstraps. This is a serious charge against Hegel, and one that is not without merit, but a finer appreciation of his position shows that the situation is at least a good deal more complex.

Concrete universals must be embodied, so Hegel would not take the self-movement of the concept to be something that occurs only in a kind of Platonic heaven, apart from all sensuous, material reality. The movement of the concept must be embodied in a movement of things embodying the concept. Nature embodies the concept in one way, but not a way best suited to showing the concept's own self-movement. It is spirit that embodies the concept in a way capable of exhibiting its self-movement. On the one hand the social structures of humanity embody the concept, and thus the historical development of those social structures is one form of the self-movement of the concept. But this is not the sense in which the

logic is the self-movement of the concept. The other form in which spirit embodies the concept is in thinking itself. In philosophy, pure thinking, we realize the self-movement of the concept by instantiating the self-developing system of concrete universals in a higher and still more adequate form than either nature or social reality finds possible.

Importantly, however, Hegel realises that even this pure thinking must be embodied, and its embodiment is language, for "we think in names" (*Enz.*, § 462). But if we think in words, then the movement of thought must also be a movement of words, and an investigation of "thinking and the rules of thinking" will result in conclusions that apply indirectly to language as the essential expressive embodiment of thought. This line of thought leads to the notion that Hegel's logic is an attempt to construct an ideal language. What is the Hegelian ideal for language? This is a difficult question, but one desideratum stands out above all others: The ideal language must be its own meta-language. It must contain its own truth concept and be capable of expressing its own relation to the world (and itself) truthfully. Indeed, since Hegel believes thought must *necessarily* know itself as thought, its embodiment, ideal language, must also *necessarily* be expressively complete and capable of demonstrating this expressive completeness. Thus Hegel's logic is an attempt to elaborate a set of conceptual *qua* linguistic structures that are expressively complete and capable of demonstrating this completeness by (a) reconstructing the depth-conceptual and linguistic structures we in fact find around us in ordinary language, in the sciences, and in religion and philosophy, and (b) accounting for its completeness by generating these structures from the very idea of (linguistically embodied) thought.

Hegel takes this project to be implicit in the very existence of language. He regards it as a project to which language users contribute unconsciously as they use language in navigating through the world and consciously as they engage in logic or philosophy. Hegel's logic presents an explicit and self-conscious culmination of this historical development, but not *as* an historical development—that occurs in the philosophy of history and also, in part, in the *Phenomenology*. Hegel's logic presents us with the pure results of this process: an expressively complete and self-reflexive set of linguistic/conceptual structures.

LOGIC AS THE SCIENCE OF FORM

Since everything that can be thought or expressed must utilize one of the conceptual structures/expressive forms elaborated in the logic, it is easily seen how the logic constitutes the science of form. Every possible form is

systematically generated in the course of the logic, Hegel claims, and all content, every phenomenon, will find its appropriate form somewhere in the battery of conceptual forms so generated.

It is no objection that this means Hegel intends his logic to be irrefutable and unfalsifiable; anything properly called logic intends to be irrefutable. Usually this is explained in terms of the contentlessness, the pure formality of logic. This explanation is not open to Hegel. His explanation can only be that his logic simply spells out the necessary conditions of thought, and therefore the necessary conditions of the existence of the refutable. It would be self-defeating to reject it because it is irrefutable.

But there is also no guarantee in Hegel's logic that phenomena come with their logic already patent. Although it seems to be a consequence of his interpretation of the form/content distinction that every content will have some form in which it is best expressed and comprehended, given the imperfection of nature, form-content mismatches in which both moments are obscured are only to be expected. In this case a great deal of acumen may be required for proper analysis. Surface structure may conceal logical form.

So-called "dialectical" consideration of nature or society is nothing more than a learned ability to identify the conceptual structures characteristic to the phenomena at stake.[17] This means that one understands the dialectic of X when one has properly diagnosed the kinds of conceptual structures definitive of X's. For instance, the dialectic of the family is controlled by the fact that implicit in the very concept of a family are certain kinds of relationships within the family, certain kinds of relationships between the family unit and the external world, the general function of the family in the ethical life of a community, and the relation of the family, as a social structure, to other forms of social organization such as the commercial marketplace. Not all of these relationships are superficially evident within the concept of the family, however, Dialecticians may start with a superficial understanding of the concept of a family, but as they seek to understand the concept more deeply, they can use the abstract structures plotted out in logic to explore the conceptual space of the family in greater detail. What conceptual tensions are resolved within the family structure? What tensions does it itself generate? Under what higher heading would the family fall? The concept of the family reveals as well the dysfunctional family, for it will then be clear how families can fall short of the concept. The logic provides the theoretical structures within which our comprehension of such phenomena operates; all of these phenomena and their relationships will be instances of the most general kinds of objects of thought as laid out in the logic.

PRESUPPOSITIONLESS BEGINNINGS

Though we have now seen how Hegel thinks his logic compares to the traditional conceptions of logic and metaphysics, the characterization has been very abstract. It is still hard to see how to begin this project and then carry on with it. Let us therefore consider these matters at a more practical level. How does one start doing logic? Since logic is the self-movement of the concept, it seems that there is nothing that one *does* at all. How does one get concepts to move themselves?

Hegel insists that logic can have no presuppositions, even to the point of not having a clear conception of the discipline itself until it is completed. "What logic is cannot be stated beforehand, rather does this knowledge of what it is first emerge as the final outcome and consummation of the whole exposition" (*WL*, I:23; *SL*, 43). Yet, as we will see, he also knows exactly where to begin: Being. The presuppositionlessness of logic is apparently the guarantee of its purity, its universality, its necessity, its absoluteness, and it is therefore extremely important. Yet Hegel also says that the system is a circle of circles, and that seems clearly to imply that the logic is in some sense generated by, derived from, or entailed by the rest of the system as well; why isn't this a form of presupposition?

Apparently, then, one can begin doing logic without any clear idea of what it is that one is doing or how it is to be done. Nonetheless, despite all the talk about presuppositionlessness, it is not the case that logic is begun absent of all conditions. "The beginning is *logical* in that it is to be made in the element of thought that is free and for itself, in *pure knowing*" (*WL,* I:53; *SL*, 68). The point seems to be that the essential condition for logic consists in a certain attitude or state on the part of the logician. This state of pure knowledge is reached at the end of the 1807 *Phenomenology of Spirit* by overcoming the subject-object distinction altogether. However one arrives at it (there is no reason to believe it can be reached only via the train of thought contained in the *Phenomenology*),[18] pure knowing is a state in which thinking is directed solely upon thought itself (shades of Aristotle's thought thinking thought!), without constraint from any sensory conditions, prejudices of the understanding, or even preconceptions about thinking. One has, as it were, opened oneself up to the world, which can finally lay itself bare before one, unobscured by merely subjective intrusions. Even this way of describing the situation rings slightly false, for it makes the world seem something distinguished from and therefore opposed to an observing consciousness. But in pure knowing the distinction between knower and known, subject and world, has utterly vanished, or more accurately, there is only a distinction in their forms, for in pure knowing the content of world and thought is identical.[19]

> Now starting from this determination of pure knowledge, all that is needed to ensure that the beginning remains immanent in its scientific development is to consider, or rather, ridding oneself of all other reflections and opinions whatever, simply to take up, *what is there before us*.
>
> Pure knowing as concentrated into this unity has sublated all reference to an other and to mediation; it is without any distinction and as thus distinctionless, ceases itself to be knowledge; what is present is only *simple immediacy*.
>
> (*WL*, I:54; *SL*, 69)

Hegel admits that in this case pure knowing as an outcome of finite (impure) knowing is presupposed, but pure knowing in this sense is not a thesis or claim that is presupposed. It is itself a mode of being, a being in a position to know. It is not itself a cognitive presupposition, but only the presupposition of pure cognition. The circle is complete when this mode of being has itself been reapprehended in knowledge and the identity of thought and being it is predicated upon is vindicated.

> But if no presupposition is to be made and the beginning itself is taken *immediately*, then its only determination is that it is to be the beginning of logic, of thought as such. All that is present is simply the resolve, which can also be regarded as arbitrary, that we propose to consider thought as such.
>
> (*WL*, I:54; *SL*, 70)

The claim here seems even more radical: The honest, even naive resolve to think about thought as such should be sufficient to begin logic, for that honest, if naive, resolve begins from the identity of thought and being. We do not need to know that we are in the state of pure knowledge to begin logic. To require that before we begin doing logic we know that we have achieved a state of pure knowing would introduce a cognitive presupposition again. The possibility of pure knowing—which Hegel equates with the identity of thought and being—means that the honest resolve to think about thought can and eventually will succeed. The vindication of the state of pure knowing achieved by the end of our deliberations suffices to legitimate the entire undertaking. The only things that stand in the way of reaching that consummation are the sedimented preconceptions we have accumulated through our experience of acculturation.

But why should the appropriate beginning be pure being? Hegel tells us that since it is a pure beginning, it must be something immediate, that is, not derived from anything else, not mediated by any other. Further, it must be simple, without any internal structure (or we would have to start with

that). He then informs us that "this simple immediacy… in its true expression is *pure being*" (*WL,* I:54; *SL*,) 69). Why is this? What makes "being" the correct expression of the beginning point of logic? Here we encounter a general difficulty with Hegel's logic: The concept designations he chooses often seem less than compelling. That the simple, immediate universality with which logic begins should be called "being" is, in fact, more intuitive than many of his other choices. Although we have said that logic is tied to language in that thought must express itself in language, there is no guarantee that the purified structures of thought will map exactly onto the pre-existing vocabulary and manipulation rules of any language. Ordinary language gives us a rich resource refined over millennia of reflection, but the logician must get behind the surface structures of the language to uncover the real logical structures embodied in that language.

> Philosophy has the right to select from the language of common life which is made for the world of pictorial thinking, such expressions as *seem to approximate* to the determinations of the Concept. There cannot be any question of *demonstrating* for a word selected from the language of common life that in common life, too, one associates with it the same concept for which philosophy employs it; for common life has no concepts, but only pictorial thoughts and general ideas, and to recognize the concept in what is else a mere general idea is philosophy itself.
>
> (*WL*, II:357; *SL*, 708)

The history of philosophy provides a particularly rich resource, for it mirrors (though by no means exactly) the progress of thought itself. Thus, the attempt to think pure immediacy appeared early on in the philosophy of the Eleatics. Parmenides' pronouncement that "Being is and Not-Being is not" is its earliest expression, and surely Hegel is leaning on this phrasing when he says that the beginning point, simple immediacy, is being. The attempt to think pure being turns out to be unstable—it is identical to a thought of pure nothing, even though the two concepts are superficially in absolute opposition. And it is no accident that this conflict generates a concept Hegel expresses as "becoming," the key word in Heraclitus' philosophy.

TRIADS AND DIALECTIC

Hegel is perhaps most renowned for the constant triadic structure of his logic, popularized without much textual basis as "thesis-antithesis—synthesis." But whatever slogan one uses to characterize the triadic

structures encountered throughout the logic, Hegel believes this pattern arises necessarily from "the method" of the logic. Since, as we have seen, this method is no method at all, but rather the self-movement of the concept, Hegel believes the triadic structure is inherent in concepts themselves (*Enz*., § 79). What are these triads, and why does Hegel believe that the conceptual realm is so structured?

Logic is the self-investigation of thought; at its end, thought must comprehend itself. We can therefore think of each concept encountered in the logic as a candidate theory of thought. This is a slightly misleading way to phrase it, for it seems to presuppose that someone, a subjectivity external to and separate from the object of its thinking, is proposing some abstract set of propositions intended to characterize correctly that object of thought. Thus, there would be three relata here: a subject, an object, and a theory. But in logic there is only one presence: self-related thought. We might better think of each concept in the logic as a mode of thought's self-relation. And since thought *is* self-constituting activity, each concept is therefore a mode of thought's existence. The highest mode of thought's existence, the mode without which it could not be the completely self-constituting activity of thought, is the Idea, thought's adequate self-comprehension.

Put another way, the constant content throughout the logic is thought itself; each of the concepts encountered up to the Idea is a less than fully adequate form for that content. Though less than fully adequate, each captures a dimension of thought, a real mode of thought's existence. The form adequate to the content of logic is, in fact, none other than the comprehension of the whole of the series of less than adequate forms, for collectively the concepts embody and enable thought's self-comprehension.

Suppose, then, we begin with the honest resolve to think thought, and that we begin with the immediate, simple universality Hegel calls "being." It is important to be clear about what this beginning point is. It is to be *pure* being, which means that no determinate being is in question here. It is not the kind of being one may talk of in speaking of the *being of a number* or the *being of space* or the *being of consciousness*. Hegel is well aware that this concept is an abstraction, indeed, the absolute abstraction from all determinateness.

As the beginning point of the logic this concept is at once a prototheory of thought and a mode of thought itself, a way in which thought *is*. As a proto-theory of thought, something a consciousness considers for adoption, there are many inadequacies to this concept: It is highly inarticulate, unable to describe or explain any of the phenomena we normally associate with thought, including its own existence. But as correct as such considerations are, they are irrelevant from Hegel's point of view. They do not exhibit the "self-movement of the concept," for one.

They exhibit instead an external reflection upon a subjective reality, according to Hegel. Second, while they may give good reason for rejecting the proto-theory, they fail in two regards: (a) they do not show whether the concept indeed captures something of the nature of thought, and (b) they do not point the way to a better conception.

But consider this concept as itself a mode or determination of thought. For being is as much a way of thinking as an object of thought. Concepts are not simple, given entities, each capable of its existence entirely separately from others. They are essentially and necessarily involved in contrastive relations, in entailment relations, etc. The system of pure thoughts forms a self-realizing structure. No single determination of thought is entirely self-subsistent. The concept of pure being, indeterminate immediacy, however, attempts to be just that—without inner determination, without relation to anything else. In its attempt to purify itself from every determinate content, it divests itself of all content and turns out to be identical to the concept of nothing. In this case the self-movement of these concepts turns out to be the intrinsic connection between the contents (or in this case, lack thereof) of the concepts.

Hegel confronts the question of how these concepts could be self-moving more explicitly in considering Jacobi's critique of Kant's notion of *a priori* synthesis. Jacobi claimed that when he achieved a state of purified, abstract consciousness, no synthetic activity, no "movement" among the concepts was evident at all. Hegel replies:

> But this is found immediately in them. They [the thoughts of pure space, pure time, pure being, and so on] are, as Jacobi profusely describes them, results of abstraction; they are expressly determined as *indeterminate* and this—to go back to its simplest form—is being. But it is this very *indeterminateness* which constitutes its determinateness; for indeterminateness is opposed to determinateness; hence as so opposed it is itself determinate or the negative, and the pure, quite abstract negative. It is this indeterminateness or abstract negation which thus has being present within it, which reflection, both outer and inner, enunciates when it equates it with nothing, declares it to be an empty product of thought, to be nothing. Or it can be expressed thus: because being is devoid of all determination whatsoever, it is not the (affirmative) determinateness which it is; it is not being but nothing.
>
> (*WL,* I:85; *SL,* 99)

The attempt to think pure, indeterminate being is, in effect, a failure, for its indeterminateness is its determinateness. But thought does not stop here. The failure is not absolute. Thinking of pure being has turned out to be thinking of nothing, but this unity of being and nothing has

transformed them both. The lesson is that in all thinking being and nothing are thought together.

> Being and nothing are the same; but in their truth, in their unity, they have vanished as these determinations and are now something else. Being and nothing are the same; *but just because they are the same they are no longer being and nothing,* but now have a different significance…. This unity now remains their base from which they do not again emerge in the abstract significance of being and nothing.
>
> (*WL,* I:95; *SL,* 108)

Everything and everythinking is a union of being and nothing; just how these two are to be unified and what further transformations must occur before a fully stable conceptual scheme is available is the story of the logic.[20]

But Hegel admits that the transaction between being and nothing is not typical: there is no real *transition* to be found, but only an immediate identity.

> In the pure reflection of the beginning as it is made in this logic with being as such, the transition is still concealed; because *being* is posited only as immediate, therefore *nothing* emerges in it only immediately. But all the subsequent determinations, like determinate being which immediately follows, are more concrete; in determinate being there is already *posited* that which contains and produces the contradiction of those abstractions and therefore their transition.
>
> (*WL,* I:86; *SL,* 99)

Nonetheless, this unity of being and nothing, which is their "truth," is labeled "becoming" by Hegel.

> *Becoming* is the unseparatedness of being and nothing, not the unity which abstracts from being and nothing; but as the unity of *being* and *nothing* it is this *determinate* unity in which there *is* both being and nothing. But in so far as being and nothing, each unseparated from its other, is, each *is not*. They *are* therefore in this unity but only as vanishing, sublated moments.
>
> (*WL,* I:92; *SL,* 105)

Depending on whether one emphasizes being or nothing as the immediate element and the other as related to it, becoming has two forms, coming-to-be and ceasing-to-be. But is "becoming" at all an appropriate label for the unity of being and nothing? It has the historical pedigree of being Heraclitus' response to Parmenidean Being, but it is so loaded down with temporal connotations and so closely associated with the notion of change

that it seems at best a highly misleading choice of terms. But it is also hard to see what other term might serve better. Becoming is the third, yet it is not itself stable.

> Being and nothing are in this unity only as vanishing moments; yet becoming as such *is* only through their distinguishedness. Their vanishing, therefore, is the vanishing of becoming of the vanishing of the vanishing itself. Becoming is an unstable unrest which settles into a stable result.
>
> (*WL,* I:93; *SL,* 106)

The stable result is the concept of determinate being. Being and nothing have been transformed, or rather have revealed their true colors in their unity, becoming, but this very unity cannot retain the character of becoming. "It is...inherently self-contradictory, because the determinations it unites within itself are opposed to each other; such a unity destroys itself" (ibid.). Becoming destroys itself, not by negating itself entirely—that would return to mere nothing—but by settling into a stable and once again immediate oneness: determinate being.

The identification of being and nothing seems to be motivated by considerations of the nature of identity and individuation of concepts by their contents and other reasonable considerations in the context of the project of the logic. But the subsequent moves to becoming and thence to determinate being do not seem nearly as intelligibly grounded. It is hard not to think that talk of the vanishing of vanishing and suchlike is mere word play without significant philosophical import. Yet there is also something intuitively right about Hegel's conclusion that the attempts to think pure immediacy must fail in favor of thoughts of determinately qualified forms of being. The text of the logic challenges the interpreter to show how Hegel's principal moves actually trace the "self-movement of the concept"—a movement that is supposed to be the very soul of intelligibility—despite a superficial form as crabbed and obscure as any text ever written.

Numerous authors have attempted overviews of the progress of Hegel's logic, and numerous claims have been made about the general course of the argumentation, but there is still no thoroughgoing commentary on Hegel's logic to place beside the commentaries on other philosophical masters by scholars like Cornford, W.D.Ross, Vaihinger, or Kemp Smith. No one has been able systematically to reconstruct the flow of argumentation in the logic in a thoroughly coherent, detailed, and intelligible manner. In the opinion of this writer, generalizations about the overall pattern of argumentation followed by attempts to show with specific examples how the pattern is instantiated have for so long failed so badly to illuminate this text that a new push to investigate the individual

arguments entirely on their own should take precedence. If Hegel's pronouncements about his method are correct and in each case only the self-movement of the concept is involved, each argument should be intelligible in its own right. Indeed, if Hegel's remark that the method of the logic just is the self-movement of the concept is taken more seriously than most of his interpreters have allowed, there may be no higher principles involved throughout the whole course of the logic.[21] The detail work may be all that there is to understanding Hegel's logic.

APPENDIX

I have marked one divergence between the *Science of Logic* and the *Encyclopedia* in the Doctrine of Being, but it should be noted that the *Encyclopedia* includes far less detail than the greater *Logic* and that the arrangement in the Doctrine of Essence differs fairly significantly, enough that it could not be easily marked on this outline.[22]

I. The Doctrine of Being
  A. Determinateness (Quality)
    1. Being
      a. Being
      b. Nothing
      c. Becoming
        (1) Unity of Being and Nothing
        (2) Moments of Becoming: Coming-to-be and Ceasing-to-be
        (3) Sublation of Becoming
    2 Determinate Being
      a. Determinate Being as Such
        (1) Determinate Being in General
        (2) Quality
        (3) Something
      b. Finitude
        (1) Something and Other
        (2) Determination, Constitution, and Limit
        (3) Finitude
          (a) The Immediacy of Finitude
          (b) Limitation and the Ought
          (c) Transition of the Finite into the Infinite
      c. Infinity
        (1) The Infinite in General

(2) Alternating Determination of the Finite and Infinite
(3) Affirmative Infinity

3. Being-for-self
   a. Being-for-self as such
      (1) Determinate Being and Being-for-self
      (2) Being-for-one
      (3) The One
   b The One and the Many
      (1) The One in its Own Self
      (2) The One and the Void
      (3) Many Ones—Repulsion
   c. Repulsion and Attraction
      (1) Exclusion of the One
      (2) The One of Attraction
      (3) The Relation of Repulsion and Attraction

B. Magnitude (Quantity)
   1. Quantity
      a. Pure Quantity
      b. Continuous and Discrete Magnitude
      c. Limitation of Quantity
   2. Quantum
      a. Number
      b. Extensive and Intensive Quantum
         (1) Their Difference
         (2) Identity of Extensive and Intensive Magnitude
         (3) Alteration of Quantum
      c. Quantitative Infinity
         (1) Its Concept
         (2) The Quantitative Infinite Process
         (3) The Infinity of Quantum
   3. The Quantitative Relation or Ratio (*Enc.*: Degree)
      a. The Direct Ratio
      b. Inverse Ratio
      c. The Ratio of Powers

C. Measure
   1. Specific Quantity
      a. The Specific Quantum
      b. Specifying Measure
         (1) The Rule
         (2) Specifying Measure
         (3) Relation of the Two Sides as Qualities
      c. Being-for-self in Measure
   2. Real Measure

a. The Relation of Self-subsistent Measures
(1) Combination of Two Measures
(2) Measure as a Series of Measure Relations
(3) Elective Affinity
b. Nodal Line of Measure Relations
c. The Measureless
3. The Becoming of Essence
a. Absolute Indifference
b. Indifference as an Inverse Ratio of its Factors
c. Transition into Essence

II. The Doctrine of Essence
A. Essence as Reflection within Itself
1. Illusory Being
a. The Essential and the Unessential
b. Illusory Being
c. Reflection
(1) Positing Reflection
(2) External Reflection
(3) Determining Reflection
2. The Essentialities of Determinations of Reflection
a. Identity
b. Difference
(1) Absolute Difference
(2) Diversity
(3) Opposition
c. Contradiction
3. Ground
a. Absolute Ground
(1) Form and Essence
(2) Form and Matter
(3) Form and Content
b. Determinate Ground
(1) Formal Ground
(2) Real Ground
(3) The Complete Ground
c. Condition
(1) The Relatively Unconditioned
(2) The Absolutely Unconditioned
(3) Emergence of the Fact into Existence
B. Appearance
I. Existence
a. The Thing and its Properties
(1) Thing-in-itself and Existence

(2) Property
(3) The Reciprocal Action of Things
b. The Constitution of the Thing out of Matters
c. Dissolution of the Thing
2. Appearance
a. The Law of Appearance
b. The World of Appearance and World-in-itself
c. Dissolution of Appearance
3. The Essential Relation
a. The Relation of Whole and Parts
b. The Relation of Force and its Expression
(1) The Conditionedness of Force
(2) The Solicitation of Force
(3) The Infinity of Force
c. Relation of Outer and Inner

C. Actuality
1. The Absolute
a. The Exposition of the Absolute
b. The Absolute Attribute
c. The Mode of the Absolute
2. Actuality
a. Contingency, or Formal Actuality, Possibility, and Necessity
b. Relative Necessity, or Real Actuality, Possibility, and Necessity
c. Absolute Necessity
3. The Absolute Relation
a. The Relation of Substantiality
b. The Relation of Causality
(1) Formal Causality
(2) The Determinate Relation of Causality
(3) Action and Reaction
c. Reciprocity

III. The Doctrine of the Concept
A. Subjectivity
1. The Concept
a. The Universal Concept
b. The Particular Concept
c. The Individual
2. The Judgment
a. The Judgment of Existence (Inherence)
(1) The Positive Judgment
(2) The Negative Judgment

(3) The Infinite Judgment
b. The Judgment of Reflection
(1) The Singular Judgment
(2) The Particular Judgment
(3) The Universal Judgment
c. The Judgment of Necessity
(1) The Categorical Judgment
(2) The Hypothetical Judgment
(3) The Disjunctive Judgment
d. The Judgment of the Concept
(1) The Assertoric Judgment
(2) The Problematic Judgment
(3) The Apodeictic Judgment
3. The Syllogism
a. The Syllogism of Existence
(1) First Figure of the Syllogism
(2) The Second Figure: P-I-U
(3) The Third Figure: I-U-P
(4) The Fourth Figure: U-U-U, or the Mathematical Syllogism
b. The Syllogism of Reflection
(1) The Syllogism of Allness
(2) The Syllogism of Induction
(3) The Syllogism of Analogy
c. The Syllogism of Necessity
(1) The Categorical Syllogism
(2) The Hypothetical Syllogism
(3) The Disjunctive Syllogism

B. Objectivity
1. Mechanism
a. The Mechanical Object
b. The Mechanical Process
(1) The Formal Mechanical Process
(2) The Real Mechanical Process
(3) The Product of the Mechanical Process
c. Absolute Mechanism
(1) The Center
(2) Law
(3) Transition of Mechanism
2. Chemism
a. The Chemical Object
b. The Chemical Process
c. Transition of Chemism

3. Teleology
    a. The Subjective End
    b. The Means
    c. The Realized End

C. The Idea
1. Life
    a. The Living Individual
    b. The Life Process
    c. The Genus
2. The Idea of Cognition
    a. The Idea of the True
        (1) Analytic Cognition
        (2) Synthetic Cognition
            (a) Definition
            (b) Division
            (c) The Theorem
    b. The Idea of the Good
3. The Absolute Idea

NOTES

1 Ideally, the formal properties of items do not depend in any way on their semantic or representational properties, and therefore cannot depend in any way on the nature of the reality they represent. But this is really too simple, since the logician must distinguish logical from nonlogical particles. The whole reason for making the distinction and doing logic in the first place rests on the different kinds of content embodied in the symbols.

2 Traditionally, logic is thought to spell out the conditions for thought's 'agreeing' with itself, assuming that unless it agrees with itself, it cannot agree with reality. But there are substantive (and nonformal) assumptions here about the nature of such internal agreement and about the nature of reality.

3 *WL*: Hegel, *Wissenschaft der Logik*, 2 vols, ed. G.Lasson (Leipzig: Meiner, 1923); *SL: Hegel's Science of logic*, trans. A.V.Miller (London: Allen & Unwin, 1969).

4 I distinguish between the generic discipline of logic and Hegel's particular treatment of it by calling his treatment *the* logic. This usage does not distinguish between his treatments in the *Science of Logic* and the *Encyclopedia of the Philosophical Sciences*.

5 Note that Hegel explicitly does not say that the logic is an exposition of the ideas or the mind of God, for he would insist that this kind of imagistic and metaphoric way of describing the logic is very inadequate. Rather, it is an exposition of God himself.

6 A good example of this occurs in the *Zusätz* to § 24 of the *Encyclopedia*, where the Mosaic legend of the fall of man is read as an "ancient picture of the origin and consequences" of the self-disruption of spirit that makes all knowledge possible to begin with.

7 Actually, Hegel himself would have been more likely to have said that this development bottomed out with Kant, whom in this regard he classifies as an empiricist, simply because the hard-core nominalist empiricists still held onto the simple faith that thought (in their case their ideas and impressions) and reality match. Only in Kant are we inescapably confined to a realm of thought without direct connection to reality.

8 "It is one of the profoundest and truest insights to be found in the *Critique of Pure Reason* that the *unity* which constitutes the nature of the *Concept* is recognized as the *original synthetic* unity of *apperception*, as unity of the *I think,* or of self-consciousness…. Thus we are justified by a cardinal principle of the Kantian philosophy in referring to the nature of the *I* in order to learn what the *Concept* is" (*WL*, II:221–2; *SL*, 584–5).

9 Hegel does not believe that the *cogito* expresses a direct intuition of a substantial soul. Indeed, just what is at stake in the *cogito* turns out to be very complex and intertwined with a great deal of other knowledge about ourselves and the world around us. Thus, Hegel's interpretation of the *cogito* is highly anti-Cartesian. I have discussed this in greater detail in W.A.deVries, *Hegel's Theory of Mental Activity* (Ithaca: Cornell University Press, 1988), ch. 6.

10 Hegel, of course, never couches his objection to Kant in these terms.

11 See *WL*, II:220–3; *SL*, 583–5.

12 This aspect of Hegel's logic has been emphasized in K.Düsing, *Das Problem der Subjektivität in Hegels Logik*, Hegel-Studien Beiheft 15 (Bonn: Bouvier, 1976).

13 The following section is derived, in substance, from deVries, op. cit., pp. 171–4.

14 The attitude of the understanding seeks to find and hold on to a set of rigid categories and distinctions that can be brought independently to bear on any material. The pre-Kantian thinkers, both rationalist and empiricist, with their consistent drive to decompose everything into simple atoms, are strong examples of this (pre-)philosophical attitude.

15 See R.Aquila, "Predication and Hegel's Metaphysics," in M.J.Inwood (ed.), *Hegel*, Oxford Readings in Philosophy (Oxford: Oxford University Press, 1985).

16 Cf. the discussion of the active universal and "objective thought" in *Enz.*, §§ 19–25.

17 Hegel seems to assume that with sufficient consideration one conceptual structure will present itself as being *the* structure characteristic of the phenomenon in question. But why could there not be alternative structures, perhaps each revealing something important about the phenomenon, but none with a claim to being *the* privileged structure inherent in the phenomenon? Hegel's own attempts to find the "right" structure for the philosophy of religion, for instance, show that he struggled with different alternatives.

18 Nevertheless, there are some contemporary commentators, e.g. Kenley Dove and William Maker, who seem to hold that retracing the *Phenomenology* is indeed the only way to achieve this state.

19 Although Husserl never thought much of Hegel, Hegel's conception of the attitude of pure knowing bears striking similarities to Husserl's notion of the phenomenological attitude. This may help explain why so many of Husserl's followers, unlike their master, found Hegel fascinating.

20 For any excellent review of the interpretations and criticisms of the opening moves in Hegel's logic, see D.Henrich, "Anfang und Methode der Logik," in his *Hegel im Kontext* (Frankfurt Main: Suhrkamp, 1967). Unfortunately, this

essay—the entire book, for that matter—is not available in English translation.

21 The major argument against this particularist reading of Hegel's logic is that it leaves the systematic triadicity of the system totally unexplained. Surely there is no particular reason to think that each and every concept must have an intrinsic, implicit triadic structure. I am willing to hazard the revisionist guess that the triadicity is an artifact of Hegel's commitment to a logic of terms in which the principal model of logical relation is a three-termed syllogism. But this is not the place to defend such a radical interpretation.

22 Hegel succeeded in revising only the Doctrine of Being before his untimely death. This revision brings it into accord with the logic as contained in the third edition of the *Encyclopedia*. But the Doctrine of Essence remains unrevised in the *Science of Logic,* and it differs in some significant ways from the version contained in the *Encyclopedia*. We must assume that had Hegel lived to revise the Doctrine of Essence in the larger *Logic,* it would have been brought into agreement with the version in the *Encyclopedia*. I am not aware of a thoroughgoing study of the differences between the two logics. Significantly, the Doctrine of the Concept as contained in the *Science of Logic* and published in 1816, several years after the appearance of the first two parts, accords substantially with the version in the *Encyclopedia;* apparently it would not have needed as extensive revision.

SELECT BIBLIOGRAPHY

Original language editions

CHAPTER 8

Hegel, spirit, and politics

Leo Rauch

Hegel's impact on political thought has been immense—giving shape to the major political movements of the modern world. Yet the person of average education is hardly familiar with the name, which is usually identified with a small number of simplistic statements, to the effect that Hegel argued for the supremacy of state power over all else; or that Hegel says individuals must subject themselves completely to the will of the state, and so on. Moreover, Hegel was seen (until recently) as the prophet of German totalitarianism—and the alleged evidence for this is in his characterization of the state as "the divine idea as it exists on earth," "the march of God in the world," etc.

In our century, such views have ominous echoes, especially when we have seen states override the rights of individuals; when state power has more often crushed personal freedom than it has preserved it; when individuals have all too often been forced to cooperate in their own enslavement by the state; and when the areas of state power have been expanding irreversibly. In the light of all this it surely seems that any endorsement of state supremacy is suspect and ought to be rejected out of hand.

Moreover, we may well wonder if there is anything in Hegel's political philosophy that merits our attention. The affirmative answer comes from the fact that so much of what he wrote has been reflected in other political streams, even if these involve distortions of Hegel's thinking. World communism, for example, adopted the dialectical logic of Hegel's worldview, although that dialectic was linked (in communism) to a materialism Hegel had rejected utterly.

There is no question about Hegel's power to fascinate readers with his views of state and history. To understand his views, we must understand his reaction to the eighteenth-century Enlightenment. In an age that placed

great emphasis on the concept of a static and unchanging human nature, Hegel chose to emphasize the dynamism of the political theater. He sees the political reality as being historical through and through. But that dynamism also characterizes culture in all its aspects. And if we now regard the law, medicine, science, and the arts as fundamentally dynamic—so that it is by now basic for us to study these in their histories—this perspective is due in no small part to Hegel. But in regard to the dynamism of politics we must ask: If politics presents a scene of change, what is it changing from? what is it changing to?

DYNAMISM AND HISTORY

The dynamic emphasis was not always the norm. Thinkers associated with the Enlightenment believed that there is a fixed human nature, making all historical change unreal. As Voltaire is often thought to have said, "Plus ça change, plus c'est la même chose."[1] And Hume, in his *Enquiry* (VIII:i), tells us that if we wish to know the ancient Greeks and Romans we need merely study the French and English, since humanity stays much the same, and history "informs us of nothing new or strange."

Hegel's approach makes a sharp contrast to all this. Instead of arguing for the unchanging character of human nature, Hegel emphasizes the evolutionary perspective in history: the state, and all else that is human, is seen to be in process and to derive its significance from the process. The Spanish philosopher José Ortega y Gasset said: "Man has no nature, only a history." The very concept of an unchanging human nature seems to have been mocked by history's spectacle of mindless chaos and blind change. Hegel rejects the characterization of history as mindless and blind: History does have an aim, and that aim is rational. If so, what is all this change aimed at? If the fundamental characterization of humanity involves its volatility in the dimension of *time,* in what direction does time take us: to development or decline? And how inevitable is the historical process anyway?

Hegel's way of addressing this complex issue is to make it even more complex. If we agree to see human life as historical in its very essence, the historical dimension must be seen in a global perspective—even in a cosmic perspective whereby human history is regarded as a continuation of the development of the cosmos as a whole. In the terminology of our own time, we may see the cosmos beginning as simple matter composed of undifferentiated particles, but ending as mind and culture subsumed under the heading of what Hegel calls Spirit: i.e. all that has been created by humans using their minds, language, culture, and society. *Geist* has also

been seen as a "general consciousness, a single mind common to all men."[2] It is this metaphor that makes it possible for Hegel to look at history as though it were the report of the world's own coming to self-consciousness, like a mind growing up and achieving maturity and freedom.

What about matter and spirit? How did we get from the one pole to the other? In the temporal "distance" between these two poles (matter and spirit), we see an emerging process: it all has tended in the direction of the highly complex and self-conscious beings we are—beings capable of understanding themselves in rational terms and giving shape to their lives accordingly; beings capable of grasping their own history, and of seeing reason at work in it.

Hegel must have been struck by the sheer wonder of it all. But if so, he did more than wonder at it: he organized his wonderment into a comprehensive system of metaphysical speculation. In his *Encyclopaedia of the Philosophical Sciences* (1817), Hegel undertook to demonstrate a very remarkable doctrine (among other remarkable ones): namely that the mere *concept* of Being must eventuate in an existing world, an Ontological Argument for the world's existence. Being—a purely abstract and formal concept in metaphysics—must somehow lead to an eventual materialization of itself as reality, so that the self-enclosed concept must produce a version of itself outside itself, as nature! From there, Hegel went on to show how the world of inorganic nature must produce an organic version of itself, as life. And from there he showed how life as such must lead to consciousness and then to self-consciousness. Moreover, he showed how these separate stages *must* follow from one another, not merely as a haphazard biological/ evolutionary progression but as a matter of *logical* necessity.

The final goal of the process—that is, our rational self-consciousness made real in the world—must be seen as somehow embedded in its very beginning. The omega is entailed in the alpha—so that our modern cultural life, in all its wealth of complexity and detail, is implicitly there in the simple first moments of the life of the universe. (Needless to say, Hegel does not use such a term as "the Big Bang.") If we are now so highly evolved as to be capable of understanding ourselves rationally, this self-consciousness of ours must be the final goal of the entire process, the purpose that gives the cosmos its ultimate meaning. Accordingly, it is Spirit—fully evolved and fully self-conscious—that is the goal of history. And the entire process of cosmic evolution culminates in *freedom* (for in being fully self-conscious we are in a position to act freely, according to our own will, and to shape our lives to meet the standards of our own rationality).

Hegel undertakes to show how such freedom has emerged in time. History is the account of the emergence of freedom (in the fullest sense of

that term). Not all cultures have attained such self-directing freedom, and they are therefore in the early or intermediary stages in the evolutionary process of history. Obviously, an authoritarian culture, in which only one person is "free," does not provide the setting wherein the individual participants can regard themselves as fully self-motivating, since they are not in a position to shape their lives according to their own rational precepts. Thus Hegel sees history as the gradual fulfillment of our rational potential, in freedom.

All this must change our view of the violent history of Hegel's time—and ours. History is not a chaotic succession of meaningless and disconnected events. There *is* a meaning that unites it all, Hegel says, a meaning we can see if we approach history with a rational attitude. In his view, then, the unifying meaning is implicit in the omega of history: the fully explicit and self-conscious rationality manifested in a public life of full freedom.

Yet we might ask: Assuming that this genuine goal of full rationality could be realized, would it justify the necessary sacrifices? In our century (perhaps the most horrific of them all), the question of a sacrificial calculus is inescapable. Every point on the horizon has its pile of corpses heaped up in the name of so-called "historical" aims: there are the vast multitudes who died in the prolonged trench warfare of the First World War; the millions who were victims of Stalin's collectivization; the millions who perished in Hitler's "final solution," not to mention the further millions, on all sides, who died in the Second World War as its victims or combatants; then think of Hiroshima; of Mao's "cultural revolution"; of Cambodia and Vietnam; and on and on. Can all this misery be said to have contributed to the developing freedom and rationality of history? And even if such a contribution could be proven, in the long range, could the remote goal justify all the immediate suffering?

Hegel has no illusions about history's violence and its short-range irrationality. He does not see history as filled with sweetness and light. Indeed, he speaks of history as a "slaughter-bench." He lived through the Napoleonic Wars; and although he admired Napoleon when he saw him on horseback, riding through the conquered city of Jena in 1806, Hegel knew that he must come to terms with the destructive side in what Napoleon had done, and keep both eyes open to history's murderous aspect. How, then, could anyone argue for the intrinsic rationality of history, in view of its so obvious irrationality?

For Hegel, the irrational element in history is necessary for the fulfillment of the ultimate aims of cosmic reason. He argues for this view on two levels: He begins by saying that "world-historical individuals" such as Alexander, Caesar, and Napoleon (i.e. the "movers" of history) are merely the unwitting instruments of a higher Spirit working through them,

a Spirit which is mysteriously exploiting their very irrationality for the sake of Spirit's rational goals, and achieving (through these individuals) ends *they* never intended, but which were the implicit goals of history all along. This is the "Cunning of Reason" in history.

Then he extends this concept to human action in general. Human actions stem from human passions, needs, and interests; and however irrational these may be, they too are the means whereby the World Spirit fulfills its rational goals. Thus the aims of Spirit are made real through the actions of the human will, revolving around its irrational passions, etc. And thus the rational Idea (i.e. cosmic reason) and the irrational passions of the individual are interwoven as the "warp and woof" of history, Hegel says.

THE DIALECTIC

We have seen that human beings can act irrationally, yet serve the rational goals of cosmic Spirit in so doing. Despite all appearances, therefore, there is an implicit rationality at work in history and in states. Does this entail a contradiction? Could this be a positive feature of states and their history?

Here we must say a few words about the topic of Hegel's dialectic. The term "dialectic" means (in Greek) discourse, debate, logical reasoning. Hegel adopted it as a technical term, to mean "logic" in a special sense. Aristotle's logic avoids contradiction—so that if a conclusion contradicts its premises, you know that the argument is invalid. Hegel incorporates the element of contradiction into his discourse, and makes it play a constructive role there.

Here is how it works: An idea or proposition *(thesis)* will readily suggest its opposite *(antithesis)*, and the one will enter into the very definition of the other. (Think of the idea of slavery, and how the idea of freedom enters into its very meaning. Think of Rousseau's ringing sentence: "Man is born free, and yet everywhere he is in chains.") For Aristotle, a thesis and its antithesis cannot *both* be true; you must give up one or the other. Hegel says that two opposed statements *can* be true if each is only a partial truth. Indeed, each leads to its opposite *because* it is true in only a partial manner. When we see the partial nature of such truths, we are led to think of a higher truth which is more comprehensive and includes them both, *as* partial, so that the partial nature of these lower truths is overcome. (Thus we could respond to Rousseau by saying: "Yes, man is by nature free, but he himself freely creates the chains of his enslavement.") This higher truth, bringing thesis and antithesis together, is a *synthesis*. The synthesis, in turn, will generate a further opposite. ("If

man is free to create his chains, then he is free to break them. Why, then, does he remain unfree?")

Let us take note of the productivity of thought as it arises out of the clash of its implicit opposites. (It, too, is creating its chains, then breaking them.) The Danish physicist Niels Bohr said: "There are two sorts of truth, small truth and great truth; the opposite of a small truth is a falsehood; the opposite of a great truth is a further truth." This remark is straight out of Hegel, except that Hegel was not content to let such a contradiction remain a contradiction; rather, he would take it to a higher synthesis. He might say: "The great truths and their opposites are in opposition only by virture of their compatibility."

From this, Hegel goes on to the remarkable view that this dialectical logic works in two separate but parallel areas, i.e. in thought and in history. Thus our thinking process is dialectical in character, creating its own counter-questions and their solutions, leading to further questions, etc. But Hegel goes on to say that history, too, is dialectical in the way it unfolds—for it is marked by conflicts and solutions, then further conflicts, and so on. Thus the process of history has the same implicit logic to it, the dialectic.

Thus the main feature of the dialectic is that it is said to work in two spheres—the formal and the factual, i.e. logic and history. This means that if some events are linked logically, that is also the way they are linked in reality—with the same rigorous necessity characterizing both.

But here we may want to ask: Is there not an antithesis between logic and history, as there is between pure theory and concrete reality? (This antithesis, as well, cries out to be resolved in a higher synthesis.) Thus in the field of pure theory we are confronted by an embarrassing series of dichotomies (e.g. freedom vs determinism, facts vs values, individual rights vs collective expectations, etc.)—and the only way these antitheses can begin to be resolved is by showing that their component "truths" are not final, that they are mere abstractions or merely piecemeal truths, and that they can be brought to unifying syntheses if we see them from a "higher" (unifying) perspective. From that perspective, both thesis and antithesis are "negated" at the same time that they are "lifted up" (as we shall see in the forthcoming example of the classless society).

At all events we must grasp the parallelism of logic and history—an isomorphism that becomes feasible when we realize that the way our minds think things through (when we think in a thorough manner) is actually the way things do and *must* happen—again, because the same necessity is to be found in both spheres. It is this feature that enables us to declare, about any series of connected events, that whatever *has* happened *had* to happen.

We can thereby presume to demonstrate the inevitability of (say) the

Communist Revolution of 1917 by showing that it occurred with a logical necessity, both in its initial causes and its ultimate aims: Thus the opposed interests of the bourgeoisie and the proletariat (as thesis vs antithesis) erupted into open conflict wherein class differences were eventually to be eliminated through the creation of a supposedly classless society (synthesis). So, if Marx and Engels are correct, and all history is the record of class conflict, then the synthesis that is the classless society negates social classes entirely at the same time that it elevates them into a higher synthesis—wherein the individual would see him- or herself as belonging to a higher entity, altogether outside class.

It is an ironic fact about the dialectic process that a synthesis need not be final either, but that it too may create a further opposition in another antithesis, to be followed by yet another synthesis, and on and on. If, however, any historical synthesis *is* final, then it becomes the "end" of history—in the combined sense of its completion and its ultimate purpose (and, indeed, that is how the "classless society" was seen by Marxist theoreticians).

We may conclude, therefore, that what drives history is its internal (i.e. formal) conflicts brought about by the one-sided "partiality" and inconclusiveness of its theses and antitheses, and that all this will come to an end in an all-embracing synthesis wherein the imperfections inherent in the one-sidednesses are altogether overcome.

We must leave to the judgment of history the question as to whether this dialectical vision is for the most part correct. However that may be, the fact that so many historical events do involve conflict of some sort tends to make the dialectical explanation a useful model, though probably a reductive and simplistic one. Moreover, since the dialectical model is most often applied after the events, not predictively, its power to explain is limited because it is so arbitrary. Hegel never uses the dialectical model in this formal and puerile manner, but only for the purpose of arguing in support of the link between logic and history—a link that is somewhat reflected in the powerful statement in the Preface of Hegel's *Philosophy of Right:* "What is rational is actual; what is actual is rational" (p. 10).

HISTORY AND THE COSMIC SPIRIT

With the foregoing statement—important enough for Hegel to utter it in his Preface—the parallelism of thought and reality comes into full view. That link is possible because both belong to the realm of Spirit. The concept of "Spirit" *(Geist)* is so central to Hegel's entire doctrine that if that concept falls, then his entire system falls with it. What can be said for it, or against it?

To begin with, the concept of a World Spirit *(Weltgeist)* is the paradigm case of a "metaphysical" concept if ever there was one. And if we adopt the anti-metaphysical stance so typical of our age, we would have to say that *any* sentence with the word "Spirit" in it (as Hegel uses the term) cannot be verified, and so it must be rejected as a sentence devoid of meaning. Thus if I say, "Spirit acts through the world-historical individuals," I cannot describe just *how* the connection works, or how Spirit makes them act as they do. Further, I cannot specify what observable conditions would make that sentence true or make it false. In the absence of such verifying or falsifying conditions, the sentence must be judged to be literally without meaning! (This is the general criticism leveled by Logical Positivists against all metaphysical utterances.)

Moreover, if we were to adopt the Marxian standpoint, we would have to say that Hegel's doctrine of Spirit (as a doctrine) is nothing but theology in disguise. Like the God of the Bible, Hegel's "Spirit" acts in history, chooses certain nations to bring *its* (Spirit's) message to the world, acts through certain individuals to manifest *its* will—and all the while keeps its (i.e. His) ultimate intentions hidden. ("God works in mysterious ways…" The sentence has the same meaning if its subject is "Spirit.") And if Hegel is really talking theology in this metaphysical doctrine of his (as Marxist criticism alleges), and religion is the opium of the people (an opium employed for the purpose of keeping the lower classes in their place), then Hegel's doctrine is on very shaky ground indeed.

Yet there is no denying some important points in favor of Hegel's doctrine of Spirit:

(a) In view of history's dynamic nature, it does seem to be moving toward a goal. Hegel speaks of the process of history as though it were an individual mind growing up and becoming aware of itself, a process of maturation in the world's "mind." We therefore need the concept of a "mind" or "Spirit" to give meaning to the process.

Consider the probable mentality of (say) Neanderthals or other paleolithic primitives who might have come only as far as domesticating fire and the dog, and who might have had only the most rudimentary ideas about their surrounding world. They must have had only the vaguest reasonings regarding their own social organization. Their ability to function in the world, to explain it successfully and make use of its opportunities for providing food, clothing, shelter, health, social order, and security—all these would have been severely limited.

Now contrast the picture (admittedly fanciful) of that crude mentality to that of a Freud, Einstein, Bertrand Russell, and it is obvious that we have come a long way in our mental evolution. Our capacity for handling abstract concepts has grown exponentially. Our ability to think our way through a complex series of issues in a sustained way, then to

communicate and record the process—all this has far exceeded anything of which the primitive was capable.

In what does the difference consist? If we say it is a difference in "culture"—what does that term amount to in its comparative/ explanatory power? Frued, Einstein, and Russell were the "products" of their culture—and they would hardly have survived in the Neanderthal world. The Neanderthals, in turn, no doubt had their characteristic ways of relating to the world, of using it and explaining it, etc. But this relativistic approach of ours (placing all "cultures" on an equal footing) gives us little; in and of itself, it does not tell us what the differences amount to.

The difference between "us" and "them" is not simply in what we might call civilization. To account for the contrast, we must observe that the intervening process has been thrusting its way *toward* the goal of a more articulate level of self-consciousness—i.e. a more complex mentality or spirituality active in the world. The historical process makes sense only in the light of that increasing complexity in the mentalization or spiritualization of humanity. Thus we become human to the degree that we can think of ourselves as human. With this, the concept of a developing Spirit is indispensable if we are to understand the process as a whole. Otherwise the process itself (along with the contrast between ourselves and the primitives) remains an unexplored mystery.

(b) Moreover, without that concept there would be an unexplained mystery in connection with cultural boundaries which some civilizations have marked out for themselves: Why do the Elizabethans have such sublime theater, but so little painting? Why do the Florentines produce such magnificent painting, but such negligible theater in comparison to the Elizabethans? How is is that the ancient Hebrews develop such an exalted conception of deity, at a level of thought calling for the most profound wisdom and insight—yet have nothing to say in regard to art as such, or democracy, or science? How could the ancient Greeks, that miraculous people, have had so much to contribute in art, science, and mathematics—and even have invented tragic drama, democracy, and philosophy—yet not have gone so far as the most elementary form of monotheism?

Here, the concept of Spirit has considerable explanatory power. Hegel says that the characteristic differences between cultures can be explained by what he calls the "Spirit of a people" *(Volksgeist)*. As he sees it, each people has a distinct contribution to make to the great stream of cultural history. A people will step up upon the stage of world history just once, will say its "lines," and then step down. The Hebraic contribution of ethical monotheism is entirely distinctive in the Hebrews; no other people could have made that contribution to world culture, and that world culture is the richer for it. The Greek contribution of theater, democracy, science, and philosophy is (in its totality) similarly distinctive. Again, no

other people could have made that combined contribution, and without it the world would be a bleak place indeed—with no civilization at all but only some form of stunted cultural existence.

These contributions—the "lines" spoken by each of these peoples on the world stage—are not arbitrary or accidental, but are rather the necessary steps in the maturation of the world's "mind." At certain definite moments in time, this or that contribution had to be made—and the world's "mind" chose one people or another to make it. This is precisely what demarcates one people or another. It is the Hebraic *Volksgeist* and the Greek *Volksgeist* that explain what these peoples *are,* thereby dispelling the mystery about their different capacities and characteristic achievements. At this level we are no longer dealing with a mysterious cosmic Spirit or world mind, but with Spirit in a more limited scope, the mind of a people or nation—and perhaps the concept's explanatory force is all the greater for being limited.

(c) There is a further argument to support the concept of Spirit, perhaps the most convincing of all: An inventory of the world's "contents" must include not only all material objects and material particles; it must also include all thoughts, all actions, relations, concepts, meanings, etc. All these latter things must be differentiated from material objects, since their descriptions cannot be equated with material descriptions. They must therefore be consigned to a nonmaterial category, and this is Spirit. (We could just as well call it "Mind," or the "mental," and Hegel would accept these terms as equivalent, since *Geist* includes them all.) Spirit embraces the totality of human significations. And if we are to see that totality in dynamic terms, as evolving in history and historical time, then we must have a dynamic conception of Spirit itself, to comprehend all that is cultural and distinctly human.

We ought to respond to the Marxian objection made earlier—to the effect that Hegel's metaphysical doctrine or history is theology in disguise, that his philosophy is merely a version of religion. Thus Hegel's statements about history should (in the view of Marx) be translatable into theological statements, and these translations should then reflect the true meaning of what Hegel has to say. Hegel, however, maintains the converse: rather than philosophy being religion in another form, religion is actually philosophy in another form. That is to say, religious assertions are trying to say what philosophy says, but they say it crudely, by means of imagery (human figures representing abstract concepts, and so on). Thus religious statements are inadequate expressions of deeper philosophic truth; and it is the philosophic truth (not the religious) which is ultimate—since philosophy is fully articulate and self-critical, while religion must express its insights in nothing better than imperfect verbalizations which must wait to get their truth by way of philosophy.

Marx respected Hegel for his dialectical logic—the logic of conflict and its overcoming. He accepted Hegel's view that history works dialectically (the Marxian class struggle being the best example of dialectical conflict in history). But Marx felt that Hegel was wrong about Spirit being the moving force in history; he believed he had cleared up one of Hegel's errors, replacing Hegel's "idealistic" doctrine with a "materialistic" view of history. (This occasioned Marx's famous remark about his finding Hegel standing on his head, and setting him back on his feet.) It was Plekhanov who in 1891 coined the phrase "dialectical materialism" to characterize Marx's view of history. Yet Marx's "materialistic conception of history" involves a false materialism: the "material forces" which he believes move history are the economic factors embedded in human society; they are the products of human effort, not the effects of physical matter. Hegel calls them Objective Spirit—and they *are* the work of Spirit, after all, not of matter. Despite Marx's never-ending attack on Hegel, the Marxian conception of history is Hegelian through and through.

Thus, if there is any doubt about Hegel's view that "ideas" move history, such doubt is readily dispelled by Marx's own case, since the "material forces" he adduces are themselves the work of the "mental," i.e. people's *ideas* about history—and few "ideas" have moved history more decisively than have Marx's doctrines.

REASON IN THE WORLD

We saw Hegel say, "What is rational is actual; what is actual is rational." Here, again, we see the implicit parallelism of thought and history, united by a parallel dialectic. Elsewhere he says that when we approach the world with our own rationality, the world responds by showing us its rationality in return. (This is from his *Introduction to the Philosophy of History,* p. 14.) The rational aspect he shows us is the world's dialectical structure—which we can comprehend because it parallels the dialectical structure of our thinking.

Here, then, we may see a further side to the puzzling theme of Spirit in history: Instead of seeing "Spirit" as a mysterious metaphysical agency (and most critics of Hegel see him thinking in just this way), we might take "Spirit" to refer merely to the element of active reason in the world, the rational in the actual.

Once we have this in full view, Hegel's "metaphysical" utterances are tamed and demystified. In every way he can, he is trying to account for the existence of reason in the world. After we have acknowledged the obvious truism that the world and the mind are mutually reflective, mutually

consistent, we can either marvel at the fact or shrug our shoulders at it. Hegel sees the consistency between world and mind, between the actual and the rational, as the most deeply problematic of truths. Einstein said: "The one incomprehensible fact about the world is that it is comprehensible." For Hegel, that fact is *not* incomprehensible, and his aim is to show this to be so.

He approaches the problem at a number of levels: Not only does he make it a metaphysical issue requiring some very complex lines of argument (as in the grand structure of his *Encyclopaedia*); he also examines the actual workings of reason in such different areas as art, religion, culture in general, history—and political life. Here, then (as I suggest), we see a less-than-metaphysical approach being taken by him. And as soon as we realize that this is so—namely, that not all his explanations are intended as metaphysical assertions but rather as statements closer to the world's everyday ontology—then many of his "metaphysical" utterances (so called) become less daunting.

In the *Introduction to the Philosophy of History* (p. 75), there is the oft-quoted statement: "World history in general is…the unfolding of Spirit in *time,* as nature is the unfolding of the Idea in *space*." This statement is far less metaphysical-sounding when we realize that Hegel is merely contrasting the realm of mind and culture with that of physical nature. Each has its source in a rational process, Hegel is saying.

HEGEL'S *PHILOSOPHY OF RIGHT*

Much of the tradition of political thought rests on two tenets that are sometimes made explicit, but are more often left tacit. These are:

> The human being is by nature a social animal.
> The human being is by nature a rational animal.

Political theory, throughout its variegated course, has tried to prove the mutual compatibility of these two statements—although there have been thinkers, such as Nietzsche, who have sought to demonstrate how incompatible these are, so that our social inclination is by no means a rational one. If they are compatible, then we may expect human society to exhibit the same rationality that typifies all other human contrivances and constructions; if they are not compatible, then there is no basis for expecting society (or anything else that is human) to display anything like a rational aspect. The problem goes back to a wider controversy in ancient Greek philosophy, as to whether the laws are the product of nature or of convention: Are social values

entirely random, arbitrary—and irrational? For Nietzsche, there is nothing in social life or custom that can be given a fully rational and intellectually satisfying justification. (In one of his examples, he speaks of a culture in which the act of scraping ice off one's boots with a knife is punishable by death—and he seems to be saying that there is no socially sanctioned act anywhere that does any better in its justification.)

On the other hand, we have had a host of thinkers who regard the state as a rational device specifically created (by rational and naturally social creatures) to serve one or more of our basic social purposes: to promote peace and social order; to protect life and property; to determine and secure natural rights; to insure that a people will have a unifying voice; to make possible the transmission of inherited values from one generation to the next; to make it possible for the wisest to rule, etc. Whatever these various theories argue for, they share an emphasis on the purposiveness and rationality of societal life. Is it at all rational and sensible for individuals to enter into social ties with others? Presumably, we enter into contractual arrangements with one another for one rational end or another. Having done so, is it rational and sensible for us to try to give further order to our societal interrelations through the application of reason? Or is all this speculation about the social interactions of ourselves as primordial humans merely an idle exercise?

Of course, like Nietzsche, we may express no confidence at all in the reasonableness of human institutions and arrangements. Where Nietzsche is at the nadir of trust in regard to such institutions, Hegel is at the zenith—as reflected in the motto we have been citing about the rational and the actual. Society, as Aristotle says, begins with the process of satisfying the needs of life, although its ultimate aim is the pursuit of the *good* life. Again, how rational are these as goals, and how rational is the aim of achieving them?

We might go so far as to conceive of certain rights, to which all humans may lay claim; we may even speak of such rights as parts of self-evident truths, i.e. as standing to reason. But it is no secret that the theoretical foundations of these rights have been roundly attacked over the centuries. (Can an attack on what is "self-evident" avoid self-contradiction?) Accordingly, we may state one of the challenges confronting Hegel as follows: to decline the use of "natural rights" as a basis for a theory of statehood; yet to maintain the emphasis on the *rationality* of the state.

There are further challenges: Throughout his Preface, Hegel argues against the uncritical acceptance of social convention and entrenched values. What is to be decisive is not convention but *truth*. We may or may not wish to go along with him in his search for a basis in objectivity for such truth. As for its other criteria we must reiterate his motto, since it tells us that only what is *fully* rational is actualized in the world, and only

the fully actual is transparently rational. All this reminds us that we must avoid convention as a basis for argument, along with the intellectual fashion of the moment, and especially the individual conscience. All these are now seen as impediments in the search for truth, its objectivity and rationality.

All this may well be a sensible goal in, say, logic or mathematics. In political theory, moored as it is in the concrete life of society and its values, we can hardly avoid our individual feelings and points of view. Can we be altogether free of perspectives that have become historically ingrained? Hegel insists that we must somehow put these things behind us if we are to have any hope of attaining truth and rationality.

Hegel goes so far as to suggest that Plato drew his *Republic* from the values implicit in Greek ethical life. What is the status of that "actuality"? In Hegel's motto, the German word that is translated as "actual" is *wirklich*. With this, he does not mean that just any actuality is rational—and certainly not the false and ephemeral "actuality" we encounter in political life. Rather, *wirklich* refers to the union of existence and essence—as when we speak of a "real" athlete, one who fulfills the essence of what it means to *be* an athlete. Accordingly, *wirklich* means "real" (or actual), "true," "genuine," etc.

And therefore Hegel's "science of the state" (i.e. of the rational/ actual state) is not a study of this or that example of statehood, but of the state that perfectly fulfills the functioning *ideal*. Up to this point we can hardly have been enlightened as to what all this means. Yet when we do grasp this, the challenge that faces us is "to apprehend in the show of the temporal and transient the substance which is immanent and the eternal which is present" (p. 10).

The state's rationality and its actualization as such emerge together. Thus, a further challenge confronting Hegel is "to apprehend and portray the state as something inherently rational" (p. 11). This sounds as though he is trying to set up an ideal of the state as it *ought* to be (à la Plato). But no, it is the state as it *is* which is to be united with its essence, as the actuality. As he tells us: "To comprehend what is, this is the task of philosophy, because what is, is reason."

To apprehend the eternal in what is transitory. But most emphatically, this does *not* involve setting up a standard of perfection with the purpose of getting us to live up to it. Instead, there is a hint of resignation when Hegel admits that the aim of philosophy is not to change the world, but only to apprehend our own time by way of thought (again, the synthesis of the rational and the actual). As for changing the world, wisdom makes its appearance only at the end of an era, when things can no longer be changed but only understood. As he famously says: "The owl of Minerva takes to flight only in the oncoming dusk."

HEGEL'S *INTRODUCTION*[3]

We have been speaking of history as an evolutionary process. That process, however, is not entirely value-neutral. Instead, Hegel sees it as involving (a) the concept of right, and (b) its actualization through time, in a transition from merely "abstract" right to "concrete" right, fully realized. Consider, for example, such concepts as these: "selfhood," "humanity," "property," "obligation," and so on. In some societies these could be mere concepts, with an application that is nothing more than a matter of *form* or ritual; in other societies, these concepts might be more fully articulated, with a *content* that can be given words as well as a concrete expression in societal life.

On a broader scale, we may contrast an arid ideology (powerful though it may be) against a set of political tenets whose meaning is made fully verbal and rational. This transition, then, is what occurs (or should occur) in any society in the course of time. It is a transition to a stage of cultural life wherein mind is consciously applied, a transition to something more fully rational and actual in regard to the element of *right*.

We must not identify this with the values held by any particular society (whose existence is in any case contingent and variable). Nor ought we to link "reason" to any social values expressed as positive law in this or that place. Rather, we must think of a universal, or norm, applied to particular cases in law, but reflecting the essential *Geist* of a people (par. 3). Above all else, it is the essence of right that we are seeking: its basis is Spirit which is given expression as the will of a people. Since the will is free, as Hegel explains, freedom is both the substance of right and its goal. Indeed, "the system of right is the realm of freedom made actual, the world of mind brought forth out of itself like a second nature" (par. 4). Yet although the process is free, it is in search of determination. This is provided by its dialectical counterpart.

The free will, taken to an extreme in politics, ignores all restraints. As a result it rises to pure destructiveness, to eliminate all individuals who might pose some sort of a threat to it, and thus turning to destroy the social order itself. Hegel is obviously thinking of the French Revolution in this regard; but these words of his are ominous for our own time as well—with all the abundant examples of murderous autocracies operating destructively in the name of "freedom," equality, or whatever (as abstract ideas).

This is one of the most penetrating insights Hegel offers: namely, that the abstract idea is not merely one-sided and empty of content; but that it is necessarily destructive, in that its partiality and one-sidedness—mistaken as the *whole* truth—must become destructive of society as a

whole, as a result of the violence inhering in the dialectic itself. There are numerous ways whereby this may occur: The will, being free, is indeterminate; it is the ego that seeks to give itself some determinate content. In so doing, it turns back into itself; it becomes the reflection of itself, by reflecting on its own reflection—and this is its universality, its infinity, its self-determination, and also its absoluteness (par. 7). Above all, its self-relatedness is its freedom. And in that freedom from external factors, it may well become politically autistic and violent; or it may become rational.

We might wonder whether Hegel is thinking here in terms of the will of the individual or the will of a people. Most likely, he is deliberately conflating the two levels of discourse, so that the individual will can be taken as a metaphor for the social will. Once he has engaged that metaphor, he can come to analogous conclusions about a social "mind"—attaining its freedom, self-determination, and maturity on the basis of how an individual undergoes the same process. From here it is an easy step to conclude that just as the individual ego is autonomous, so the social "mind" can claim a similar degree of autonomy, even an absolute authority over its own "selfhood." Hegel often decried the use of analogy in philosophical argument; he preferred direct (non-analogical) discourse, whereby we say exactly what we mean, and nothing else.

Yet the fact is that he himself employs analogies—and he does so in support of his most crucial points (the twofold "mind" being one such analogy, among others), and this must cast much of what he says into doubt, since this "double-speak" is deliberately ambiguous on this score. Thus, while leaving the question open as to whether he is speaking of the will of an individual person or the will of a people, he can say: "It is not until it has itself as its object that the will is for *itself* what it is in itself" (par. 10). Only in its self-awareness does the will, or ego, attain its essence. But just *whose* will is this—that of the individual person or that of society? This question is not addressed, since Hegel prefers to leave the ambiguity in place. Shortly thereafter (par. 13), he speaks of the individual will coming to its resolutions; but as individual it is a will only in form, and is therefore abstract.

It is in the individual will that we see the dialectic of choice and resolution combining to form contradictions in the ego, an ego therefore divided against itself. This is surely a destabilizing factor when it occurs in the social "mind," which sees these differences of will as arbitrary, subjective, and threatening; they are therefore uprooted as much as possible. With this remark, Hegel seems to damn all dissent in society, as well as all diversity (par. 19). We get the same result by extending his metaphor: a psyche divided is unhealthy in the individual, and is made healthy by its integration; in the social "psyche" integration is wholesome,

a people speaking with one voice, in a unity of social purpose. Such integration ought therefore to be fostered as the primary social goal.

What is most important is to get the will away from its abstractness, so that it becomes self-relating and self-determining, thereby achieving its freedom, universality, and infinitude (as we have seen). This, then, is its truth (pars 21–3). By turning back into itself, the will is able (in its resulting indeterminacy) to turn outward and project itself into the world, which it shapes according to that will.

This defines the progression in Hegel's *Philosophy of Right-proceeding* from the abstractness of its concepts to their external embodiment, thence back into the will and its freedom, it is then turned outward once more, but now energized by its freedom. Having turned outward, the will is made objective in a shared system of morals, to be followed by what he calls "Ethical Life" (par. 33). This will undergo a dialectic of its own. The book is therefore divided into three main sections: "Abstract Right," "Morality," and "Ethical Life."

ABSTRACT RIGHT

John Locke, in his *Second Treatise of Government*, explains how rights evolve, and he uses the right of property as the paradigm of all other rights: Thus, a man in the "state of nature," wherein no one owns anything, mixes his bodily labor with nature (say, by picking fruit off a tree). The resulting product of this mixture is rightfully his. A similar argument holds for all other rights: they, too, are extensions of one's bodily self, expressions of one's will. In this way, the rights to "life, liberty, and estate" are established. Governments are specifically set up for the purpose of safeguarding those rights.

Here we can think of a variety of philosophic approaches describing the basic formation of the state as a primordial instrument for securing property and personal safety. Obviously, we do not leave it at that—as though, with security achieved, the state has completed its task. Rather, the state persists beyond that task; there are further purposes for it.

Moreover, the right which is secured by the primordial state is merely an "abstract" right—namely, a formal, less-than-real right. This is because there can be no "right" to property *prior* to the establishing of a government and a system of ownership, and therefore no rights which a government is *subsequently* meant to protect. What Hegel must do, therefore, is to show that the "abstract" right is an *inadequate* and incomplete picture of rights and their justifications.

The essence of what it is to be a person involves the notion of self-

relatedness. Selfhood is a relation in which a self relates itself to itself. This powerful paradox is derived from Schelling. (It is a paradox because a relation relates one term to another that is pre-existing; and yet, in Schelling's terms, the self does not pre-exist for a self to relate to, but only begins to exist as a *result* of the relation itself.) Hegel reiterates this point by saying: "I am simply and solely self-relation" (par. 35). Only by virtue of my relation to my self, which logically should already exist, do I *then* begin to exist as a self. Hegel needs this paradox, this antithesis, as a basis for his subsequent dialectic. On the other hand, Locke's exposition is straightforward, involving a progression from a state of nature, to labor, to property, to ownership, to a civil state which protects property, etc. Hegel goes much deeper, to the ego which originates labor and which owns; yet that ego is paradoxical, since it is not the originator but the *result* of its acts of will.

Locke's picture is that of the rational primitive who discovers that there are things to be gotten through labor, and that these things must be protected by some human invention; the state is that invention. There is nothing problematic about the insight of this primitive individual. Hegel's dialectic, however, is not driven by anything so straightforward. Rather, Hegel's dialectic is driven by paradoxicality: it is the ego itself, in its self-relatedness, that is the engine of the dialectic. My self-relatedness is what gives me my sense of self, my sense of being complete in myself. It is a loop by means of which I have turned inward; that turn has a dimension of universality, for in turning back into myself I see what all human beings are. I am, therefore, an individual and at the same time a universal. I am, so to say, one of a kind—and one *and* a kind, a unit-class, solo yet complete.

Yet that very sense of self is incomplete, since my self begins to emerge only from my relation to the self which is also the *product* of my self-relation. Thus I would have an abstract right if I were a Lockean manager of my external world. But then my selfhood would still be far from established. My act of establishing it, now, is what propels my thoughts and rights in their paradoxicality. Let us examine the dialectics of this.

Social contract theorists—such as Hobbes and Locke—have portrayed a "state of nature" with human occupants. Each of these is a fully formed ego, with a will which has all of the attributes of the humans *we* know. Such a primordial ego has a will which is free and universal (universal in the sense of representing all humanity). Hobbes and Locke regard their protagonist as psychologically complete, endowed with the various personal characteristics shared by the rest of us (although Hobbes and Locke differ diametrically in regard to what those "common" characteristics are). Hegel, on the other hand, regards that picture of the primal human as incomplete: Rousseau introduced the

notion of that human as but half-human; Hobbes's and Locke's man is someone we would readily recognize; Hegel sees this creature as incomplete since he will only begin to define himself through his encounter(s) with others.

Prior to such encounter(s), therefore, the self is not yet in the process of self-formation, let alone the fully formed and recognizable product of that process. That self is abstract, so far. As Hegel says: "The universality of this consciously free will is abstract universality, the self-conscious but otherwise contentless and simple relation of itself to itself" (par. 35). Thus this is not a fully formed individual, but a case of bare self-relatedness, a purely formal narcissism—an abstraction.

From this perspective, it follows that such "rights" as are based on such an abstraction must be merely abstract rights as well. It may be that "in my finitude I know myself as something infinite, universal, and free," but these are still a "contentless" infinitude, universality, and freedom—i.e. not concretely real, but entirely abstract.

On the other hand, it is the very abstractness of these features that enables me to connect myself to others: for in acknowledging my personhood as the basis of my rights (however abstract that personhood and those rights), I grasp my link to others on the same basis. Thus, Hobbes and Locke see my need for personal security as my reason for entering into social relations; Hegel sees those relations emerging from a recognition of others as beings similar to myself. For this purpose he enunciates something like a Kantian imperative: "Be a person and respect others as persons" (par. 36). That is the basis of universality, to be sure. Yet that personhood is incomplete as long as it does not include my recognition of whatever it is that makes me a particular individual and unique. Over against the background of the universal, therefore, I become particularized. Over against the objectivity of the others who are there, I emerge as subjective (although this contradicts my own universality). Out of this struggle between the universal and the individual, and between the objective and the subjective, my own personality evolves (par. 39).

There are rights which I attach to myself on a subjective (i.e. infantile) basis: The world is *my* world, as Wittgenstein says. When I emerge out of my infantile solipsism, my rights take on an objective character, recognized by me as inherent in my very personhood. When I enter into a contract with another person, I implicitly recognize him or her *qua* person, and I am thus recognized in turn. The transfer of property from one to another serves as the medium of personhood.

Let us note how far we have come: i.e. from the rather primitive picture offered by Hobbes and Locke, of self-interested individuals desirous of securing what they have wrested from nature, to a far more ephemeral image of human beings engaged in the far more subtle activity

of self-recognition, and from that recognition giving form to selfhood and ego, both in personal and societal terms.

The ego must turn its attention outward, by externalizing the self in some property. But the paradoxical feature of such a thing is that it is both an extension of the self, yet is separable from the self, both different from the self, yet the same. Moreover, a piece of property may be material and inert, and yet the very vehicle of selfhood. "A person has as this substantive end the right of putting his will into any and every thing…thereby making it his," Hegel says (par. 44). We may go even further and say that not only does a piece of property become *his*, it becomes *him*. Man puts himself, his will, into a thing -but, in turn, the thing may come to encompass his very self. Property is thus the *embodiment* of personality, involving not only my possession of property but also the recognition of it, as mine, by others (par. 51). This entails their recognition of my will in it. This is so fundamental a feature of ownership that we may say that the fact that a thing is recognized as mine makes the thing take on a character that is external to it.

There are dialectical elements in all this as well, and these elements, in their very contradictoriness, actually propel the dialectic into creating a social fabric. Thus the fact that a thing is *mine* (dependent on me) and also *it* (an object that is independent of me) can be said to raise difficulties which only a society can be called upon to resolve. This piece of earth is mine, although it exists as something on its own; but the opposite is also true, that its being mine becomes an external feature of the object. (Thus slavery, the ownership of a "living chattel," had to be sanctified by society; but when the time came for the abolition of slavery as an institution, only society could be expected to undertake that task.) Similar contradictions obtain with regard to my body as both mine and it; and the social fabric both sustains and dissolves this contradiction. Such contradictions account for the manysided ambiguity in the use of terms such as "my body," "my person," "my self." In general, the ambiguities arise in the dialectics of those terms as reflecting the selfhood of the user. (Do I warm my "self" at the fire?)

With property, then, a fabric of recognitions emerges. That is to say, we may see society evolving around the mutual recognition of the property right. We might even say that Hegel regards property as the first step away from "abstract right" and into the creation of a social fabric, with "rights" moving in the direction of concreteness.

In discussing the alienation of property, i.e. giving it into the hands of another person, I can also alienate my time, my creativity or ability, etc. But Hegel points out—as Marx does in the section on alienated labor in his Paris Manuscripts of 1844—that with this I am also alienating "the substance of my being…my personality" (par. 67). My product may cease

to be strictly mine if someone copies what I have made, and uses it to express their own personality. We may also wonder whether, having put my will or ego into a thing, I must devalue myself when my product drops in value.

Since property involves a tacit agreement between the owner and all others (i.e. to respect the right of the owner), we may regard that relation as implicitly contractual. Now, whether I hold on to my property (and others respect it as such) or I do alienate it by transferring it to someone else, there is a conjunction of wills (for example, in regard to the sale price). Thus we have a conjunction of wills, but also a separation of wills, since each of us is out to serve our own interest by means of the transaction. Once again, we see property and the property relation leading both to a social configuration and to selfhood.

Although we have made mention of Hobbes and Locke, we are by no means proposing to consider Hegel as another social-contract theorist. Hegel does not speak of a social contract as anything like the formative nexus of society, the way they do. For him, society is based on a fabric of mutual recognition—and this is psychological and self-relating, rather than overtly contractual. A contract is therefore a reflection of such recognition, not the genesis of it. When Hegel does discuss the meaning of a contract, he is speaking quite literally of the way contractual relations actually function *in* a social setting; he is decidedly not speaking in a metaphorical sense of a social "contract" arranged prior to the formation of society and therefore the instrument of its formation. His primary aim is to examine the working of the wills of contracting parties. Thus, in the case of a contract for a sale or exchange, he says, value passes in both directions: the seller alienates their property, while the buyer appropriates it and (say) exchanges value for it. Value, therefore, remains as a constant throughout—always provided that there is a concurrence of wills: the seller asking a certain sum, the buyer agreeing to pay that sum (pars 76, 77).

The agreement of the two parties, the legality of their contract, the very notion of right—all these things are negated when the contract is broken or is fraudulent. Thus there is the appearance of legality and formal Tightness—and obviously there could be no appearance of right without the implied background-of Tightness, legality, etc. This Tightness is reasserted if the fraud is challenged as fraud, etc. (pars 82, 83).

What we see here is a further stage in Hegel's dialectic of society: a contract requires the concurrence of wills; one of those wills is now challenged, and the challenger asserts a claim on the basis of implicit right—which now becomes explicit—and thus may lead to a clash of rights. This clash is adjudicated on the basis of right, i.e. in the question as to who has the right to the property at issue. When the right is challenged,

even when it is negated altogether, the right is in some way asserted, implicitly or explicitly.

This being so, the criminal must be regarded as acting inside the fabric of right, even when he or she violates the right of another (indeed, especially so). Here, Hegel brings out a strange result of this dialectic: namely, that the penalty which is meted out to the criminal is implicitly *his* will, an embodiment of his freedom, his right, even a right established with the criminal himself, Hegel says, so that the criminal's punishment is *his* act: "his action is the action of a rational being…[thus] the criminal has laid down a law which he explicitly recognized in his action and under which he should be brought as under his right" (par. 100). In crime, there is a conflict between a universal law (or universal will) which is implicit and a single will (that of the offender) which is explicitly independent. With punishment, the injury done is negated, the law is asserted, and the offender's freedom is secured (that is, in their having determined the law which asks for their punishment).

MORALITY

We have offered some observations about consciousness becoming self-conscious, turning back into itself. This self-consciousness is the key to a society's freedom and autonomy; and it is therefore the key to its morality as well. We might wish to say, superficially, that morality is the product of a society setting up rules for the behavior of its members. This need not necessarily be a self-conscious process. Indeed, we might compare societies for the degree of self-consciousness involved in their choice of values: some societies have managed to develop a set of mores without involving much thought in the process; others more so. But at its best—when a society is entirely conscious of what it is doing, so that it becomes self-reflecting, and examines its values in the light of other values, deeper ones, in an effort at making such values consistent and coherent—then such a society is closest to being fully in control of itself and of its destiny as it exercises its freedom in choosing the values by which it will live.

Let us recall Hegel saying that the self-consciousness of a culture is the goal of history, and this is its freedom. Thus the maturity associated with such freedom is the product of the will which has turned back into itself. In the individual person, such self-reflection is what makes that person the *subject* of their own will; the same holds true for a culture when it becomes the subject of *its* will (par. 105). It is a striking metaphor—whereby social change is presented as a maturation of the individual—yet it is but a metaphor, and thus it has its characteristic weaknesses. Hegel

persists in using it—as when, in his *Philosophy of History*, he speaks of a society as though it were an individual growing up, becoming responsible, and so on.

The metaphor is used to its strongest effect in regard to morality. Now, we are not considering the growth of morality from primitive society to complex ones; nor is Hegel giving us a picture of primitive humans in action (as Hobbes and Locke do). Yet Hegel does concern himself with the intrinsic nature of moral values as such; and therefore he must concern himself with the question of how moral values as such; and therefore he must concern himself with the question of how moral values come into being (*as though* there were human beings engaged in creating values, à la Hobbes and Locke).

The point may be clarified methodologically: The analysis of moral values exposes their component elements; with these elements in view we may see how they fit together—as though someone had actually *put* them together, actually synthesized them. This returns us to the metaphor of the maturing individual, standing for the social mind in *its* development. It is a metaphor that prevails throughout Hegel's writing, even if he does not make that metaphor explicit at all points. Thus we can regard Hegel's account of morality as *genetic*, i.e. concerned with the *origin* of values in society (and in this respect he does resemble Hobbes and Locke, though only in an abstract and formal sense).

A further extension of the metaphor is reflected in Hegel's way of regarding morality as the creation of will: he addresses this concept as though it were the will of an individual person, although it is something like an abstract social will that is meant. This adds a further dimension to the dialectic of all this: namely, in that the will is something *subjective*, within the mentality of the individual, and yet its product is *objective*, in that it is given expression in the outer world of social values. Hegel can speak of the "self-determination of the will" in its subjective character (par. 107), yet he can pit against it the objectivity of the social will (par. 109).

It is the characteristic strategy of Hegel's, after setting up a dichotomy, to show the two sides to be identical. In the case of the subjectivity/objectivity dichotomy, this is precisely what he does when he speaks of the objectification of subjectivity. Each of us absorbs social values in our individual process of enculturation, and each of us makes those values private ones, as though each of us had created them for ourselves. It is in this light that we may say that there is therefore a private and a public will at work; it is my will at work, yet it is identical to the will of others (par. 112).

Further dichotomies are reflected in the fact that the subjectivity/objectivity stand-off is externalized (and thus is resolved) in activity, as

well as in the fact that the values of the individual are those of the universal, i.e. the intention behind the action (par. 119). In transactions between individuals, it is the shared meaning of the universal that makes mutual understanding possible. The aim of all action is to produce good, or benefit—again, understood in universal terms. There can be benefit without right, or right without benefit—but neither of these is good (par. 130). Only in their combination is good realized. The subjective will sees its object(s) as good, and this is its prerogative, i.e. to judge its object(s) as being right or wrong, good or ill, legal or illegal, etc. (par. 132). But in all this the process of judging is still rather abstract, as Hegel suggests.

All this has the Kantian caste of universalizability—down to the element of duty (and it would be more Kantian still, if not for the genetic dimension of Hegel's account). Thus the objective side is eventually united with subjective knowing, so that the subjective is given expression in ethical life, where the abstractness of mere contentless morality is overcome (par. 137). At this stage, morality subsists in good intentions alone, and the good heart is taken to justify all (p. 99). Yet the objective good is lacking here. As for the identity of the two terms of the dichotomy, it is the identity of objective good with the subjective will that makes for concreteness. Hegel says that the identity of the two is the "truth" of each, and as such it constitutes the Ethical Life.

ETHICAL LIFE

From what we have seen of the Morality discussion, the component values were not yet complete. True, there was the element of universality, i.e. the humanity to which we all belong and which we share as humans. But this was still abstract as a value-element and had not yet been given concreteness in a social form. The thrust of Hegel's discussion, hereafter, will be to show that our *moral* values are a function of our *societal* arrangement, and of the way(s) our societal life is actually run.

Hegel will turn his attention to the most rudimentary form of societal life—the family—to show what values are implicit in it and, further, what values can be expected to emerge from it. Then he will go on to discuss civil society, to show some of the workings of the law and its management of justice. And finally, there will be an extended discussion of the state—as the highest (i.e. the most moral) operation of our shared life.

With Ethical Life, we enter into the institutional aspect of societal life. This may suggest the unconscious organic side; yet in Hegel's view it is that part of societal life reflecting self-conscious knowing and willing—i.e. freedom. There are values made concrete as an "objective ethical

order"—with such objectivity transcending both the subjectivity of the individual and the mutability of social mores (par. 144). Indeed, the objectivity of these values exceeds (for the individual) the "authority" of nature.

From the very outset, the individual is in a secondary position vis-à-vis these life-regulating values, "as accidents to a substance" (par. 145). And yet, this ethical "substance" is not something external or alien to us, since it is the very element of our spirituality, amounting to a "second nature." As he says: "It is mind living and present as a world, and the substance of mind thus exists now for the first time as mind" (par. 151). This is objectified in institutions such as the family and the nation. It is here that rights and duties become reciprocal, so that having the one entails having the other.

The family is held together by bonds of love, despite the fact that (as a proto-state) its characteristic function is the exercise of power. In this light, the individual exists not as a totally independent entity but as a *member* (par. 158). This is why we may see the family as a state in embryonic form.

History is a process of the growth of freedom, the story of freedom (as we have seen). Hegel can therefore see each stage as mirroring the whole: just as marriage begins with the physical aspect and proceeds to the affirmation of love, so the cosmic process as a whole involves the transition from nature to Spirit. For Hegel, then, we may say that any and every segment of the historical process is the emblem for the entirety: at first, in the opposition between nature and Spirit; then in the transition from the individuality of the two persons to their unity as one (and in the process overcoming the transiency of love).

Monogamy is the essence of marriage, Hegel says, since it entails the total absorption of the individuals in the ethical bond. Thus the family itself becomes an "individual"—one whose personality is constituted by property (par. 169). This is also the basis for setting up further families in the newer generations. Just as the offspring become independent individuals, so do the new families, making their own transition from particularity to universality (par. 181). This transition culminates in civil society, wherein the ethical life of the family is absorbed in a broader context.

We may wish to find that broader context in the state, and to regard the state in terms of some of its services, such as water supply, the post, etc. For Hegel, all these necessary functions come under the heading of civil society. This is a subordinate classification, which allows Hegel to reserve the state for higher purposes: to serve as the vehicle of history, the medium of Spirit, etc.

In the most basic terms, civil society is a communal arrangement for the

mutual satisfaction of our fundamental needs. An interesting question, therefore, asks what social values are implicitly attached to that arrangement: Does it lead us to give conscious acknowledgment to our interdependence, so that we actually come to regard society in that way? If so, then the mere understanding is at work: i.e. we grasp the meaning of civil society in its *particularity*, whereby individuals are concerned with their private interests alone. On the other hand, to grasp the essence of the state, we must appeal to reason, which is in touch with *universality*. In regard to the personal needs satisfied by civil society, mere understanding will suffice, with its focus on subjectivity and particularity. Civil society can therefore be regarded as a system of needs; the state, as we shall see, goes far beyond this.

To illuminate the system of needs (and their satisfaction) Hegel speaks of class organization in civil society: \there is the agricultural class, the business class, and the universal class (i.e. the civil servants concerned with the needs of society at large). Through some measure of self-identification with the interests of the community, a morality is built up wherein one's wider responsibility is expressed, but where the closest one comes to a universality of interests is in the right to property.

The abstract right becomes objectified when we become *conscious* of its objectification. It becomes binding in our recognition of it as *law*. Obviously this cannot be enough: there are the ties established by positive law in regard to property in civil society; but there also are the ethical ties of the heart, of love and trust (par. 213). Since these ties touch us at the most private level, morals cannot be a matter of legislation. Laws do comprise a system—and, ideally, we ought to be able to expect such a system to fulfill the requirements of any system, namely, that the totality ought to exhibit consistency, coherence, and completeness. All this would come to a test when the universal principles are applied to particular individuals and cases. Here, too, law becomes objectified in our recognition of its objectification—primarily in regard to property and the infringement of the rights connected to it (par. 218).

When a crime is committed, it is the *universal* that is being injured, and when the law exacts its vengeance it goes beyond vengeance in the personal sense which is subjective and contingent. In punishment, an offense is annulled, the law is reconciled with itself. Accordingly, we may see in this an elevation of values to an objective and universal sense—a further reflection of the historical evolution of Spirit (par. 220).

The fact that the parties to a legal case have certain express rights, and that every legal case is established on the basis of argument and proof, also reflects the evolution of spirituality by way of the introduction of reason into public life. In this way, that public life is increasingly moralized—notwithstanding the fact that the legal process *can* turn into

lethal formalities. Above all, the fact that a judge applies a universal standard to a single case reflects the process of the rational moralization of society as a whole (par. 225). (Thus we may say that the development of positive law is what enables us, by its example, to think in universal terms and thus to apply the thinking appropriate to, say, the categorical imperative.)

From all this, we might hastily conclude that all social progress is a moralizing process. We have pointed to some clear examples in this regard. Thus, in pointing to some rudimentary forms of social existence, Hegel speaks of the family as the "first ethical root of the state" (par. 255). The continuity is fundamentally ethical.

Civil society can be seen as largely efficacious in providing for society's basic needs. But Hegel also points to some inevitable weaknesses associated with civil society; and he is not far from Marx in this criticism—except for the difference that Hegel does not trace these weaknesses to capitalist production but to civil society itself. Thus there is poverty, massive unemployment, illiteracy, a disparate distribution of wealth, economic imperialism and the search for foreign markets, colonialism, etc. (pars 244–8)—ills which he includes under the rubric of "this inner dialectic of civil society" (par. 246).

Where Marx, however, would condemn the source (capitalism) for its results, Hegel merely sees them as by-products of the larger framework which is civil society. But where Marx sees that source as dissolvable in revolution—so that an industrial society would be made more moral by the removal of capitalism's antisocial and destructive effects on human beings—Hegel goes back to civil society and its broader perspective of the role of power. The primary purpose of public authority, he says, is "to actualize and maintain the universal contained within the particularity of civil society" (par. 249). A further difference, therefore, is that Marx sees true morality emerging in the negating of capitalism's effects, while Hegel sees morality emerging from the social and legal functioning of civil society itself—in its lawlike effect of universalizing human judgment within a framework of law.

THE STATE

All of Hegel's prior discussion has been leading up to his treatment of the state; and indeed, this is the culmination of his *Philosophy of Right*. But here a caution must be noted: the state is the continuation of civil society, yet it is different from it. (This tactic is consistent with his dialectic, where two adjacent areas form a continuum or identity by virtue of their

difference from one another, and differ by virtue of their being identical.) Thus civil society is a collection of atomic individuals, each motivated by a private interest that excludes the interests of others; the state, on the other hand, is a collective entity wherein individuals fulfill their separate interests by merging them into the interests of the whole (much like the ideal of the Greek *polis*).

The libertarian tradition of Anglo-American thinking sees the individual as the most fundamental political entity; with this in mind, the state is seen as a device for serving the interests of individuals—and therefore the main stress is placed on the limits to be imposed on state power. Hegel, on the other hand, comes from a *holistic* tradition wherein state power is irreducible to the interests of individuals. The state is a higher entity—even something approaching the mystical—into which the goals of individual persons are to be dissolved. Let us recall Rousseau, who gives emphasis to a *volonté générale*, a consensus wherein all voices share; the libertarian tradition, on the other hand, must allow for a *dissensus* among its individual citizens.

As for the continuity between civil society and the state, this is to be seen in the different moral purposes to be served by each: i.e. the purposes of the individual as against those of the collective. Both are systems of value, existing tacitly in custom, and explicitly in the ideal of a rational self-consciousness. As Hegel says:

> The state is the actuality of the ethical Idea. It is ethical mind *qua* the substantial will manifested and revealed to itself, knowing and thinking itself, accomplishing what it knows and in so far as it knows it. The state exists immediately in custom, mediately in individual self-consciousness, knowledge, and activity, while self-consciousness—in virtue of its sentiment towards the state—finds in the state, as its essence and the end and product of its activity, its substantive freedom.
>
> (par. 257)

Presumably, since all this is reflective of a process *toward* rationality, such rational self-consciousness is not in the state's present, but only in its idealized future. And only when its implicit aim is fully realized—i.e. as "the actuality of the substantial will which it possesses in the particular self-consciousness once that consciousness has been raised to consciousness of its universality"—only then does the state exercise a supreme right over the individual. In other words, the fully realized aim is the right of the state *qua* Plato's *Republic* (nothing less), i.e. the state as "mind objectified" (par. 258). It is also freedom objectified in self-legislating consciousness, and thus closer to Kant's ethic.

At this point, the question that must present itself is this: How can a Platonic universal or a Kantian imperative, although fully rationalized, necessarily entail any socio-political modes common to a perfect state as such? In an Addition to par. 258, Hegel declares:

> The state in and by itself is the ethical whole, the actualization of freedom; and it is an absolute end of reason that freedom should be actual. The state is mind on earth…consciously realizing itself there…. Only when it is present in consciousness, when it knows itself as a really existent object, is it the state…. The march of God in the world, that is what the state is. The basis of the state is the power of reason actualizing itself as will…. In considering the Idea of the state, we must not have our eyes on particular states…. Instead we must consider the Idea, this actual God, by itself…. The state is no ideal work of art, it stands on earth and so in the sphere of caprice, chance and error, and bad behaviour may disfigure it in many respects. But the ugliest of men, or a criminal…is still always a living man. The affirmative, life, subsists despite his defects.
>
> (Addition, p. 279)

With this, we ought to stress the point that Hegel's Platonic/Kantian dimension is no piece of idle metaphysical theorizing; rather, it calls for a fully concrete realization of the essence of political life.

Up to now, what Hegel has said in regard to the state and its supremacy over all other interests has not seemed to contradict the widespread prejudice concerning his supposed sympathy for the totalitarian state. The point is, however, that Hegel does not leave it at that; instead, he clearly argues in favor of (a) the rule of law, (b) the fulfillment of the individual's goals through the political freedom that is guaranteed to the individual by means of a constitution, and (c) the absorption of particular interests into the universal.

Accordingly, it is in this light—i.e. in the light of an existing constitutional system—that Hegel says: "The state is the actuality of concrete freedom" (par. 260). Indeed, it is only by means of particular interests and actions that the universal is achieved. In civil society, the society stands opposed to the individual (who is usually seen in an adversarial position vis-à-vis society); with the state, we see the completion of the individual, and the fulfillment of their most private concerns in and through the social. Nothing less than this can be regarded as a proper state in Hegel's sense.

We may ask, therefore: How is the individual to find a personal fulfillment in a state? Only in the union of the individual with the universal can this be achieved—a union of public and private interests,

such that the public interest is that which is closest to the individual's heart. The *polis* alone provided the framework that made such an identity possible, and thinkers such as Rousseau and Hegel have been searching ever since for ways to make it real.

Accordingly, the two polar elements—namely, the public interest and the private interest—comprise an antithesis that demands resolution in a higher synthesis. It is the state that provides such a synthesis—i.e. by offering the individual their personal fufillment in the state, as well as that very concern as embodied in the words of Hegel's Preface: "What is rational is actual; what is actual is rational." We can now see this for the tautology that it is: When the term *wirklich* is translated as "real," we have some suggestion of the Platonic realism to which Hegel is sometimes prone, though not fully committed; but when we translate *wirklich* as "actual," we have the Aristotelian *entelechy* to which Hegel is fully committed in his notion of development.

Thus Plato seeks the perfect form of the state in its pure and unchanging permanence; Aristotle's emphasis, on the contrary, is on the dynamism of the historical state in its *becoming*. The state is not a finished entity but a process: its *telos* is its *arche*, its end is in its beginning. If we can see duty and right as a dualism of reciprocal entailment (so that where there is one there is the other), we will have grasped Hegel's concept in a nutshell. He stresses this point as being of vital importance, as the source of the state's "inner strength" (par. 261, p. 162).

In civil society the antithesis (of public vs private) is of a limited nature. But when these are resolved (i.e. absorbed) in a higher synthesis, they become "the firm foundation not only of the state but also of the citizen's trust in it" (par. 265). This involves, further, the unification of the opposed realms of freedom and necessity. Thus my personal interest is both preserved and negated *(aufgehoben)* in the state, and this organic unity is, as Hegel says, "the constitution of the state" (par. 269). It should be pointed out that the term "constitution," here, does not refer to a document, or a set of laws (written or unwritten), but is to be taken as the organizing principle(s) of a state, that by which it is constituted. This organizing principle, then, is the nascent reason inhering in the state. It is in this special light, therefore, that Hegel can say: "The state is the divine will, in the sense that it is mind present on earth, unfolding itself to be the actual shape and organization of a world" (par. 270, p. 166).

The task of civilization, over the centuries, has been the transfer of the inner into the outer, "the building of reason into the real world" (par. 270, p. 167). In the modern world, this manifestation of reason in the political has involved "the development of the state to constitutional monarchy" (par. 273, p. 176). Since all this is happening to *reason*, the diremption of that process has occurred to the universal, the particular, and the

individual—not as abstract and empty categories, but as the actual legislature, the executive, and the monarch, respectively.

Hegel points to the development of the state to constitutional monarchy as "the achievement of the modern world," and the "inner deepening of the world mind." There is a greater complexity here, whether in the mind of the individual or even in that of the cosmos. This has the consequence of producing diremption, polarization, conflict, and dialectic. Indeed, it is the developing complexity of mental and political life that actually fuels the engines of change and progress. Without such conflict, nothing much would be happening, and certainly no historical advance.

Hegel suggests that the constitution of the state (i.e. its actual organization) is not to be regarded as "made" by humans, but as *sui generis* or (as he likes to put it) "divine" (par. 273, p. 178). His reasoning is peculiarly Feuerbachian (although Feuerbach published his work two decades after Hegel published his *Philosophy of Right*): Anything regarded as having been made by humans can as easily be regarded as capable of being unmade by humans; only by being seen as "divine" does it retain its measure of authority over humans and beyond change.

This must surely introduce a measure of schizophrenia into the body politic (or the mental equivalent of that metaphor): i.e. the difference between the process of opening our political life to increased rationality and the closing of that rationality for the sake of myth. Political maturity (whether in the individual or in the state) involves a coming-to-self-consciousness; and in the light of this, the deliberate self-delusion that prompts us to see the state as "divine" is a piece of counter-rationality that cannot be expected to thrive. Why is this?

One thinks here of Marx's Feuerbachian Paris Manuscripts: With regard to the institution of monarchy (or, equally, the capitalist system), can one actually "tell" oneself that this is *not* an institution made by humans—and believe it? Rather, to take that step in the direction of demythologization, and to regard any institution as man-made, is to start on the road to dismantling it, denying its superhuman authority.

Yet the Crown embodies the element of subjectivity, although this is condensed into the individual human being. To say, "The state decides," is as much as to say "The Crown decides"—but for the fact that in Hegel the crown has the limited authority of a constitutional monarch. Implicitly, the Crown combines its three component elements: the legislative power embracing the universality of the constitution and its laws; the adjudication which subsumes single cases under the universal through the power of the executive; and the power of ultimate decision by way of the self-determination in which the subjectivity of just such determinations are made (pars 273, 275). Nevertheless, the element of self-delusion (as when we say, with the ritualism of the law court, "The state versus…" or "The

Crown versus…") is all too easily dispelled, once seen—and once this is grasped we can hardly resist the inclination to demythologize all our social myths, everywhere and on all sides.

This leads us into the most troubling—and controversial—part of Hegel's entire political edifice, that of the monarch. There is hardly a philosopher who is more of a rationalist; but while this entails the dissipation of myths, we ought not to overlook Hegel's profound respect for myths and their social purpose. In this respect Hegel is the tool of his own myth-making, and this is reflected in his theorizing on kingship. One might wonder why a monarch should be needed at all in Hegel's state, given Hegel's emphasis on constitutionalism and the rule of law. Further, one might ask why a monarch is needed, as Hegel says, to embody the element of subjectivity in the state, or why that subjectivity should need to be *embodied* at all.

Perhaps this is a result of Hegel's pervasive metaphor in all this: If history can be seen as a process wherein the state (as "mind") comes to self-awareness, to maturity and freedom, then that so-called "mind" would certainly require a subjective dimension for its completion.

But must we stay with that metaphor? (Since the main point of history is that it is to be compared to a mind "growing up," we may call it Hegel's "educational metaphor" of the state.) As a metaphor, it has its uses: the state, immersed in time, is necessarily dynamic in its process—just as human individuals are in their endless movement toward a *telos*. That *telos* holds out the hope of progress in history—i.e. human individuals learning from experience. (As Dewey says, experience doesn't merely exist, it *teaches*.) The state, in its various efforts to reconcile its inner contradictions, is what produces this human thrust into the future. The state thereby fulfills the potentialities embodied in the perennial human condition. (Here is the educational metaphor once again.) In so doing, the state can be said to *learn* through time, to improve on its own enlargement, etc.—in effect, to provide the equivalent of a *secular* salvation.

Yet the ubiquitous metaphor is hardly convincing when Hegel, as we saw, speaks of something as dubious as a World-Spirit *(Weltgeist)* coming to self-awareness. He is stuck with the metaphor; we are not. Here is where the monarch comes in: as a concept, the monarch serves to flesh out the metaphor, yet it does little more than leave it in its abstract form; *in concrete*, however, it provides the subjective aspect that a *Geist* ("mind" or "Spirit") would need in order for us to understand it.

The monarch, then, enables *us* to address the metaphor, to question it and to demand that it explain itself and account for itself. Clearly, the figure of the monarch can (in principle) be addressed in this way, while the

state cannot (so that we cannot literally speak of the state's "purposes," etc.) because it is entirely impersonal.

Yet the state, as something mental (i.e. spiritual, non material), is the bearer of a "soul," an identity (Addition to par. 275, p. 287). As such it may be seen as "sovereign" over all its component elements, and containing all differences in itself. As the "soul" can be said to unify its disparate elements, so the sovereign performs a similar function by containing all differences itself. Indeed, without a monarch, Hegel says, a people is but a "formless mass" (par. 279, p. 183). As a totality, the state is an organic whole of which the monarch is the "personality."

But here a further contradiction enters, stemming from Hegel's view of the state as the embodiment of reason—i.e. reason objectified: "The state is mind fully mature and it exhibits its moments in the daylight of consciousness" (p. 283). If so, then objectified reason must reflect the realm of the immutable and be unchanging; yet states do change. If it is "the way of God with the world" that there should be states, can the state be regarded as being the effect of temporal forces? To be sure, the person of the monarch is the effect of natural forces, as *this* individual; but the state itself is a nonnatural entity, designed to serve a higher-then-natural purpose. As such, the "immediate individuality" of the monarch must be irrelevant to the state's inherent rationality. And if individuality is the synthesis of the universal and the particular, cannot the state itself be such an individual in its sovereignty, i.e. without a king?

*

Hegel is one segment of the long tradition of visionary philosophers who (beginning with Plato) have sought to introduce reason into the concept of the political world. What we must realize, with Hegel, is that that vision is to be taken as a totality, in which its prismatic elements combine to form a unity wherein those elements are merely *seen* as individual but are actually unified. As he says:

> In the state, self-consciousness finds in an organic development the actuality of its substantive knowing and willing; in religion, it finds the feeling and the representation of this its own truth as an ideal essentiality; while in philosophic science, it finds the free comprehension and knowledge of this truth as one and the same in its mutually complementary manifestations, i.e. in the state, in nature, and in the ideal world.

CHAPTER 9

The Young Hegelians, Feuerbach, and Marx

Robert Nola

Largely through lectures delivered at the University of Berlin, Hegel built up a circle of followers, mainly contemporaries or pupils, who were intent on working out aspects of the philosophical system that their master had suggested but left undeveloped. After Hegel's death in 1831 this circle, later dubbed "the Old Hegelians," became the core of a group of philosophers whose task was to put the finishing touches to the Hegelian philosophical edifice. Though there were during Hegel's lifetime external critics of his philosophy, especially his theology, the work of his close associates was directed toward establishing the unity of his system rather than exposing its inner tensions. True to its dialectical character, Hegel's philosophy did contain contradictory tendencies which if taken too far would transform the apparent unity of his system into a clash of opposites. When "the Young Hegelians" emerged in the mid-1830s, they exploited in various ways these contradictory tendencies, thereby dissolving the unity of Hegel's system and bringing about what Marx called "the putrescence of the absolute spirit."

Though his followers were not united on every aspect of Hegel's philosophy, after his death the differences between them became more marked, first in theology then in political theory. Latent divisions became open disputes when the 27-year-old David Friedrich Strauss published his *The Life of Jesus Critically Examined* in 1835–6, thereby breaking with Hegel over matters to do with religion and philosophy. Strauss (1808–74), who had attended some of Hegel's lectures just before his death, differed markedly from his master over the role which was to be assigned to the Gospels and to the life of Jesus within speculative theology.

While Hegel did not pay much attention to the actual details of the life of Christ and the historicity of the Gospels, he did think that the basic tenets of Christianity, found in the doctrine of the Trinity and expressed in historical events such as the Incarnation, the Ascension, the Creation, and the Fall, could be given an independent philosophical foundation. There would be no need to appeal, for example, to miracles or to historical evidence to establish Christian doctrine. For Hegel the very content of Christianity is identical with the content of Hegelian philosophy, though the form of each is different. The difference in form is the difference between *Vorstellung* (representation) and *Begriff* (concept). In the case of the philosophical *Begriff*, Hegelian philosophy gives us the absolute content of Christianity in the form of pure thought, or as a "deduction" from pure thought. In the case of the *Vorstellung*, popular Christianity with its dogmas deals in pictorial or representational imagery or in figurative thought. These images are not logically particular, as are our sensuous experiences of our mental imagery, but are alleged to be of universal significance; aspects of pure thought contained in such imagery are to be made explicit within Hegelian philosophical theology.

During his time as a vicar in 1830–1 Strauss became acutely aware of this difference of form; the popular religious *Vorstellung* of his parishioners seemed far removed from the religious *Begriff* of the Hegelian philosopher-theologian. While not abandoning the latter, Strauss delved more into the former, particularly the historical genesis of the ideas of Christianity among its earliest devotees. This in turn led to a close study of the life of Jesus and the manner in which this was presented in biblical texts. When *The Life of Jesus* was finally published most of it was devoted to a densely argued critical examination of the historicity of the Gospels—with only a little devoted to philosophy and speculative theology.

The startling result of Strauss's research was that even though there was an historical Christ there was little that we could regard as true of him. Instead most of the biblical stories about him were to be understood as myths, constructed not by individuals but by the earliest Christian communities in response to the teaching of Christ and the Messianic tradition which they had inherited from the Old Testament. For Strauss an "*evangelical mythus* [is] a narrative relating directly or indirectly to Jesus, which may be considered not as the expression of a fact, but as the product of an idea of his earliest followers."[1]

Earlier theologians had accounted for much of the Old Testament in terms of myth. Strauss, who drew on their work, was one of the first to extend the mythical account to much that had previously passed as literal truth in the four Gospels and the rest of the New Testament. Though his mythical account of the Gospels still remains contentious, Strauss's critical work on their historicity stands at the beginning of the modern tradition

of scholarly and scientific study of the New Testament. For Strauss the Hegelian theologian, the important consequence of his research was that there was no longer any identity between Hegelian philosophy and the Christian religion. Hegel's philosophical theology still remained correct, but if the stories of the Gospels were no longer historical truths but myths, then there is nothing in the actual history of Christianity for Hegelian theology to capture and the theology stands quite independently. As Strauss says in the Preface to the First German Edition:

> The author is aware that the essence of the Christian faith is perfectly independent of his criticism. The supernatural birth of Christ, his miracles, his resurrection and ascension, remain eternal truths, whatever doubts may be cast on their reality as historical facts.[2]

At the end of his book Strauss also made another highly contentious claim: since God and man have the same essence, viz., spirit, then they are not genuinely distinct, and thus humanity is divine. Strauss even allowed himself to talk of the God-man as an expression of this unity.[3] The argument for the identity is a bad one; the Young Hegelians were not, on the whole, sensitive to the logical faults in their arguments. However, the rejection of a transcendent God and the identification of God with man underline the extreme humanism that characterized not only Strauss's thought but the thought of all the Young Hegelians.

The conclusion of Strauss's investigations would have been, at the time of their publication, sensational enough for ordinary believers. The notoriety of his book was such that Strauss was prevented from ever obtaining a permanent university position in Germany. The reaction of his fellow Hegelians was also sensational; many rejected his interpretation of the Bible and came to doubt his Hegelian orthodoxy. In reply to their criticism in his "Controversial Writings"[4] Strauss divided the Hegelians into the Right, Center, and Left—his model being the various political factions in the French National Assembly. The Right Hegelians, also called "Old Hegelians," tended to conserve as much of the doctrines of their master as possible, particularly the old doctrine of the unity of Hegelian philosophy with the historical truth of Christianity. The Right included such people as the old defender of Hegel against earlier criticisms, Karl Friedrich Göschel (1784–1861); the successor to Hegel's chair of philosophy in Berlin, Georg Andreas Gabier (1786–1853); and, very briefly, the young Bruno Bauer (1809–82). The Center included people such as Karl Rosenkranz (1805–79) who accepted most of what Strauss claimed about Christ and the Gospels but who insisted, contrary to Strauss, that Christ, not humanity as a whole, was divine. (It was

Rosenkranz who published in 1840 a comic drama about the dissolution of Hegel's School after his death.)[5] Strauss's supporters were on the Left—the Left Hegelians. This division of reactions to Strauss's work persisted even when other Left Hegelians subsequently developed their own critiques of Christianity in ways different from Strauss's mythological explanations.

Karl Ludwig Michelet (1801–93), a Center Hegelian who was in other respects sufficiently orthodox to be one of a panel whose task was to edit the works of Hegel, suggested that there was enough in common between the Center and the Left to make the distinction unnecessary. But this initial attempt to overcome one of the divisions among the Hegelians failed to touch the major division. The differences deepened when the terms "Old (i.e. Right) Hegelians" and "Young (i.e. Left) Hegelians" became a common mode of designation for the two factions in the late 1830s[6]—though such a bipartite division simplifies in many respects the complex relationships that existed among German philosophers in the two decades after Hegel's death. As Karl Löwith says of the Old Hegelians who eschewed any radical philosophical innovation:

> They preserved Hegel's philosophy literally, continuing it in individual historical studies, but they did not reproduce it in a uniform manner beyond the period of Hegel's personal influence. For the historical movement in the nineteenth century they are without significance.[7]

The Young Hegelians were more radical; they dared explore innovatively Hegel's philosophy for their own time, rejecting aspects of it as they saw fit.

The important Young Hegelians, some of whom had attended Hegel's lectures at the University in Berlin, include: Arnold Ruge (1802–80); Ludwig Feuerbach (1804–72); Max Stirner (1806–56); David Strauss (1808–74); Bruno Bauer (1809–82) and his younger brother Edgar Bauer (1820–86); Moses Hess (1812–75); August von Cieszkowski (1814–94); Karl Marx (1818–83); and Friedrich Engels (1820–95). As their dates indicate, they were all born within the first two decades of the nineteenth century, and most, if Engels and Marx are excluded, were born in the first decade. Despite appearances the Old/Young distinction is not based on age since many contemporaries of the Young Hegelians were sufficiently philosophically orthodox to be grouped with the Old Hegelians (e.g. Rosenkranz and Michelet). Nor should it be assumed that the Left/Right distinction carries its standard political connotations. Rosenkranz, who was active in politics, adopted a liberal rather than a reactionary stance despite his identification with the Old Hegelians. In contrast, even though

Strauss's views on religion were radical, he was conservative politically, especially in the period leading up to the revolutions of 1848 when he became involved (on the whole unsuccessfully) in practical politics.[8] In fact in the 1840s, even though Strauss's *Life of Jesus* was still an important work for unorthodox Hegelians, he ceased to be a leading Young Hegelian as the focus of the criticism of Hegel shifted from his speculative theology to his social and political theory.

Given the close alliance in the Germany of the time between religion and state, any criticism of religion inevitably brought in its train conflict with the state. For this reason alone none of the Young Hegelians were able to obtain permanent teaching positions in German universities and their work was often subject to the scrutiny of the censor. For many of the Young Hegelians their critique of religion in the late 1830s laid the ground for a critique of the state in the 1840s—though few took the bold approach of Marx and Engels in finally jettisoning much of the Hegelian theory of the state and in supporting revolutionary movements. The political and social changes in Germany in the 1830s and 1840s did shape some of the differences between the Old and the Young Hegelians. Löwith makes a suggestive point when he says that the divisions between Old and Young Hegelians can be traced back to Hegel's dictum that "the real is the rational and the rational is the real."[9] The conservative Old Hegelians put emphasis on the first part of this dictum, thereby supporting the status quo, viz., that the real existing state is also rational. In contrast the more radical

Young Hegelians put emphasis on the second half of the dictum, viz., currently existing conditions were irrational and would have to be transformed so that in the future the real would be the rational (a view quickly adopted by Marx and Engels). In respect of this dictum Hegel himself was more of an Old than a Young Hegelian. The Young Hegelian movement began after the European revolutions of 1830, reached its zenith in the early 1840s, and was over by the 1848 revolutions. Frederick-William IV, who ascended the Prussian throne in 1840, had the support of many of the Young Hegelians who looked forward to the reform of the bureaucratic Prussian state and to greater participation of a broader range of people in public life. Initially the Young Hegelians benefited from the relaxation of censorship and the creation of a freer press which allowed their ideas to gain wider circulation. But this was short-lived for by the end of 1842 the radical press had been suppressed and the monarch began to move Prussia in the direction of a conservative Christian state. For the Young Hegelians who had criticized received conceptions of religion and whose political thought was, in several cases, strongly influenced by the ideals of the French Revolution, this was a move in the opposite direction from the constitutional democracy which many favored.

It is thus not surprising that some of the Young Hegelians turned to a critique of Hegel's political and social theory. Among the first of these critics was Arnold Ruge whose "Hegel's *Philosophy of Right* and the Politics of Our Times" appeared in August 1842 in the *Deutscher Jahrbücher* which he edited. Ruge argued that there was a deep-seated contradiction between the theory of the state which Hegel developed and the actual state in which he existed. As he put the matter: "The abstract inwardness of Protestantism did not free even Hegel from the illusion that one could be theoretically free without being politically free."[10] According to Ruge this raised for Hegel an ethical question which had previously haunted Kant, viz., even though one should not state falsely what one believes, should one create controversy by publicly disclosing all of what one truly believes? In Ruge's view it might have been diplomatic for Hegel not to have publicly aired all that he thought. He commented: "If Hegel had been presented with an opportunity to stand up for his theory, his times would have had to have turned against him, as happened with Kant."[11] Even though during his lifetime Hegel's philosophical theories, including his theory of the state, had the support of the Prussian government, Ruge pointedly observed that Hegel passed over the contradiction between his theory and the actual Prussian state without acknowledgment.

Ruge also complained that

> Hegel undertook to present the hereditary monarch, the majority, the bicameral system, etc., as *logical necessities*, whereas it had to be a matter of establishing all of these as products of history and of explaining and criticizing them as *historical existences*.[12]

In Ruge's view there is a place both for the philosophical discussion of the purposes and aims of the state and for the historical (and social) investigation of any form of government. However, one should not conflate historical and logical categories. Ruge goes to the heart of his difficulty with Hegel's *Philosophy of Right* when he says: "[Hegel] wrenches the state out of history and considers all of its historical forms only under logical categories (thus, right from the start the categories of universality, specificity, and singularity are employed again and again)."[13] Ruge's complaint was to be repeated later by Marx.

In February 1844 Ruge published in the *Deutsch-Französische Jahrbücher* Marx's own critique of German philosophy and the German state in an article entitled "A Contribution to the Critique of Hegel's *'Philosophy of Right'*: introduction." This was only part of a much longer paragraph-by-paragraph critique of Hegel's *Philosophy of Right* which Marx had written in the previous year and which he had intended to revise

for publication; the surviving sections of this critique first saw the light of day only in 1927.[14] Though the published "Introduction" does not contain any detailed criticism of Hegel of the sort found in the unpublished drafts, Marx does use some Hegelian notions when, for the first time, he proclaims that the proletariat is the class whose revolution will bring about the emancipation of humanity.

For Marx the proletariat is a part of what Hegel had called "civil society"; at the time Marx was writing it was just beginning to emerge in Germany with the rise of industrial development. For Hegel civil society is the sphere of private interest in which each person pursues their own ends often in conflict with others; in contrast the state is that sphere in which the clash of private interests is transcended and there is unity and universality of interest. Whatever defects there may be in actual states, Hegel says in the Preface to his *Philosophy of Right*: "This book, then, containing as it does the science of the state, is to be nothing other than the endeavour to apprehend and portray the state as something inherently rational."[15] In criticizing Hegel, Marx sets out to show: there is no separation of the sort Hegel envisages between civil society and the state; the falsity of Hegel's supposition that in the state there is rationality and unity; and universality of interest masks the fact that in actual states the interests of one particular group dominate within civil society.

Though Hegel recognizes that there are various groups within society, such as civil servants, an agricultural class, an industrial/commercial class, etc., the notion of the proletariat developed in Marx's critique of Hegel is distinctively Marx's own—but without the theoretical depth that his later economic analyses would give the notion. However, the genesis of Marx's notion of the proletariat does have its roots in Hegel's notion of a universal class, i.e. a class whose interests are supposedly those of society as a whole. Marx rejects Hegel's idea that the universal class might be the class of civil servants or the bureaucracy. He also claims that Hegel's attempt to reconcile the differences between civil society and the state is misplaced; instead the historical role of the proletariat is to abolish the very ground which makes these differences possible. In answer to the self-posed question "Where is the positive possibility of a German emancipation?" Marx replies that it lies

> In the formation of a class with *radical chains*, a class of civil society which is not a class of civil society…a sphere which has a universal character by its universal suffering…a sphere, finally, which cannot emancipate itself without emancipating itself from all other spheres of society and thereby emancipating all other spheres of society, which, in a word, is the *complete loss* of man and hence can win

> itself only through the *complete rewinning of man*. This dissolution of society as a particular estate is the *proletariat*.
>
> (*MECW*, 3:186)[16]

The future evolution of the proletariat is also described in the "Introduction" in terms of Hegel's dialectic—the one prominent feature of Hegelian thought that Marx never abandoned. Marx speaks of the proletariat "demanding *the negation of private property*." For the proletariat private property is "the *secret of its own existence*"; by calling for its abolition the proletariat undermines the very condition that makes its own existence possible. Thus the quite thoroughgoing nature of the social transformation that Marx envisages, viz., "the *dissolution of the hitherto existing world order*" (*MECW*, 3:187). Marx's notion of the proletariat thus has its origin both in a critique of speculative Hegelian political theory and in Marx's observation of the social changes taking place within Germany at the time. Much later when writing *Capital*, Marx found a more secure basis for his views about the proletariat in his economic theory; they are the means whereby surplus value is created. But, as chapter 32 of *Capital 1* shows, Marx still maintained that the future evolution of the proletariat was best described using the notions of the Hegelian dialectic.

It was through Arnold Ruge's activities as an editor and publisher that many of the ideas of the Young Hegelians found a public outlet. In 1837 he started the highly influential *Hallische Jahrbücher für deutsche Wissenschaft und Kunst*. Owing to the pressure of censorship Ruge shifted to Dresden in 1841 and continued the journal under the new name *Deutsche Jahrbücher für Wissenschaft und Kunst*, However, early in 1843 even this journal was suppressed, along with Marx's daily newspaper *Rheinische Zeitung*. In 1844 a similar fate befell the *Allgemeine Literatur-Zeitung*, started by Bruno and Edgar Bauer in Berlin in the previous year, thus ending the sequence of journals that had been the main public vehicle for Young Hegelian thought. These journals helped give the Young Hegelian movement a semblance of identity. Their end was only partly due to censorship; by 1845 the movement itself had lost whatever unity it might have possessed and much of its impetus.

The Berlin wing of the Young Hegelians, also known as Die Freien, had its origin in the Doktorenklub, a group formed at the University of Berlin in 1837 for the discussion of radical Hegelian ideas (it was in this group that Marx became acquainted with Hegelian philosophy). The leading member of Die Freien was Bruno Bauer. As a student he had attended Hegel's lectures and had been deemed sufficiently orthodox to be asked to defend the Right Hegelian position against Strauss's *Life of Jesus*. Soon after reviewing the book Bauer was converted to its general themes and

took an even more radical position than Strauss on Christianity; he became an atheist, arguing in several works that not only was there no historical truth to be found in the Gospels but Christianity was a barrier to progress and it was an irrational doctrine that ought to be opposed.

Bauer's subsequent dismissal from his university position became a *cause célèbre* for the Young Hegelians during the early 1840s. With little to lose Bauer wrote an ironic attack on Hegelian philosophy in an 1841 pamphlet, *The Trumpet of the Last Judgment over Hegel the Atheist and Antichrist: An Ultimatum*, in which Hegel is exposed as a closet atheist and revolutionary. Even the apostasy of Young Hegelians, Bauer claimed, is not original to them, for Hegel too, when unmasked, is revealed to be one of them: "It cannot be believed that they [the Young Hegelians] have not recognized the destructive rage of this [Hegel's] system, for they have taken their principle only from their Master"![17] Thus the true heirs of Hegelian thought were not the Old Hegelians and their ilk (found in university and government circles) but the Young Hegelians, since Hegel himself, when properly interpreted, also espoused their subversive and radical doctrines.

Though Bauer continued his attacks on religion he slowly dissociated himself from Die Freien, whom he dubbed "beer literati"; after the 1848 revolution, which he thought seriously mistaken, he became politically conservative. By the early 1840s Marx, who had been close to Bauer when a student at the University of Berlin, had begun to reject many of Bauer's characteristic views, especially his development of a modified version of Hegel's theory of self-consciousness. The progress of man, Bauer alleged, occurred as the result of the development of successive levels of self-consciousness, criticism being the means whereby the development of self-consciousness took place. The term "criticism" was one of the buzzwords of the Young Hegelian movement, meaning many things to each of them; Bauer and his followers even referred to their own theoretical activity as "Critical Criticism."

Bauer became the object of sustained critical attacks by Marx in both his 1844 article "On the Jewish Question" and his first collaborative work with Engels, *The Holy Family, or Critique of Critical Criticism: Against Bruno Bauer and Company* (first published in February 1845). The "Holy Family" were Bauer and his contributors to the *Allgemeine Literatur-Zeitung*, many of whom wrote in opposition to the Communist movement as it was currently developing. They doubted whether any proletarian movement could ever be the means whereby the appropriate development of self-consciousness, whether personal or social, could be achieved. For example, in September 1844 Bauer wrote in his journal that the crowd (i.e. the masses or the proletariat) were in conflict with Spirit, i.e. with critical self-consciousness. Among others he attacks French communism because if

it were to achieve its aims "it would abolish freedom in the smallest things" and give rise to a "despotic condition of subdued atoms." His conclusion is that there is "an inevitable war of the multitude against spirit and self-consciousness, and the significance of this war is found in nothing less than the fact that in it the cause of criticism is set against the genus [human species]."[18] With much hindsight it might be thought that Bauer has anticipated the despotic communism of some recent Communist societies—forms of communism which Marx had already criticized in his unpublished *Economic and Philosophic Manuscripts of 1844*.[19] However, Bauer's article is obscure both in its argument and in its appeal to "spirit and self-consciousness" as opposed to "the crowd."

Marx became increasingly opposed to the use of self-consciousness as a fundamental category of analysis; along with this went his rejection of Bauer's Critical Criticism as the means whereby self-consciousness is to be developed. From Marx's perspective it is evident that Bauer's Critical Criticism applied to self-consciousness would represent a dead end in subjective idealism and even a regressive step away from the objective idealism of Hegel. Also in drafts of the unpublished *Economic and Philosophic Manuscripts of 1844* Marx had written of the need to criticize Bauer's views; Feuerbach, Marx claimed, had shown what was wrong with the mystical transcendental aspect of Hegel's dialectic which Bauer continued to use.[20] More significantly, while in Paris in 1844 Marx had attended meetings of a worker's society called the League of the Just and had closely aligned himself with the French Communist movement; consequently he was at odds with all the contributors to the *Allgemeine Literatur-Zeitung* concerning the role of "the crowd" that Bauer and others had denigrated.

The friendship that had developed between Marx and Engels from August 1844 gave them the opportunity to collaborate in producing *The Holy Family*. Beside the broadsides against the Berlin faction of the Young Hegelians and others, the book contains not only the further development of Marx's theory of the proletariat outlined in his earlier critical work on Hegel, but also the first outlines of what was to become Marx's theory of historical materialism. Unfortunately much of the dated polemics of *The Holy Family* obscures this aspect of the development of Marx's thought. Despite the considerable differences between Marx and Bauer, Marx absorbed much of Bauer's writings; as McLellan shows,[21] Marx uses one of Bauer's metaphors when he famously says that religion is the opium of the people.

One of the final works to be identified with the Young Hegelian movement was *Dir Einzige und sein Eigentum* (1845), written by another member of Die Freien, Max Stirner (his real name being the more prosaic Johann Schmidt). Stirner's fame rests on this one book, known in English

as *The Ego and its Own: The Case of the Individual against Authority*. The book, which initially attracted much attention, is in several places merely a collection of notes without an overall structure, as befits it anarchistic theme. However, Marx and Engels thought it sufficiently important to write their own book-length critique of Stirner, whom they dubbed "Saint Max"; this long, sometimes turgid, often insightful polemic remained unpublished during their life-time.[22] Though Marx adopted none of Stirner's views, McLellan argues that Stirner's criticisms of Feuerbach did play some role in Marx's final rejection of Feuerbach, the one Young Hegelian whose influence Marx acknowledged.[23] Commentators have often linked Stirner with Nietzsche in respect of both style and content, though there is no evidence that Nietzsche ever read him. During this century Stirner has had a strong influence upon many of those of the non-Communist left and anarchists. Two writers who have attested to his influence upon their work are Herbert Read and Albert Camus.[24] On the darker side, Stirner has not been without an influence on Fascist thought.

Stirner's work stands opposed to the abstractions of thought and the tendency to systematization found in Hegel and the Young Hegelians. It is also a plea for the totally unconstrained freedom of the individual person. The short introductory section of his book, whose title "All Things Are Nothing To Me" is a quotation from Goethe, ends with the claim:

> The divine is God's concern; the human, man's. My concern is neither the divine nor the human, not the true, good, just, free, etc., but solely what is *mine,* and it is not a general one, but is unique, as I am unique. Nothing is more to me than myself![25]

Since Stirner's theme is the exaltation of the individual above any abstraction such as God, the state, the party, man or mankind, etc., he presents the main body of his book in two parts, the first called "Man," the second "I"—the unique individual or ego.

From the stance of the unique individual not only is all consideration of pure thought or Spirit to be expunged from philosophy but also all talk of man. Even Feuerbach, who believed that all talk of God is really talk of man and man's essence, is still too abstract for Stirner and becomes the object of much criticism and even undergraduate ridicule. For example, in a section of his book entitled "The Spook" Stirner says: "To know and acknowledge essences alone and nothing but essences, that is religion; its realm is a realm of essences, spooks, and ghosts."[26] Elsewhere he adds: "*Man* is the last evil *spirit* or spook…the father of lies."[27] Continuing his criticism, Stirner inverts the entire thrust of Hegelian philosophy when he says:

> Feuerbach…is always harping upon *being*. In this he too, with all his antagonism to Hegel and the absolute philosophy, is stuck fast in abstraction; for "being" is abstraction, as is even "the I". Only *I am* not abstraction alone: *I am* all in all, consequently even abstraction or nothing; I am all and nothing; I am not a mere thought, but at the same time I am full of thoughts, a thought-world. Hegel condemns the own, mine—"opinion". "Absolute thinking" is that which forgets that it is *my* thinking, that *I* think, and that it exists only through *me*.[28]

Stirner replaces fantastic Hegelian abstractions with almost common-sense banalities about what is the proper subject of thought, viz., the person. As Stirner implores us to realize when reading Hegelian philosophy: "Man, your head is haunted; you have wheels in your head!"[29] This kind of criticism of Hegel, which Stirner could have found in the earlier work of Feuerbach (and, under Feuerbach's influence, is to be found in Marx's unpublished critique of Hegel), would have a sympathetic response from more nominalistically inclined twen-tieth-century analytic philosophers.

Even Stirner's Berlin associates of Die Freien are not spared when he criticizes various forms of society in a section called "The Free." He attacks the political liberalism of the bourgeoisie, the social liberalism of the Communists, and the humane liberalism of Bruno Bauer, all of whom had their representatives in the Berlin circles in which Stirner moved. In particular Stirner picks out some features of social (or Communist—Stirner did not distinguish) liberalism that have become all too evident in twentieth-century Communist states. He is deeply suspicious of "the Sunday side" of communism in which each man views the other as brother while masking an illiberal "workday side" in which men are merely laborers. He alleges that for communism it is of our essence to labor (strictly not Marx's view). Further he argues that under communism (as well as other forms of state) our labor takes place under the domination of the all-encompassing state with its regulation of life. From this Stirner draws the conclusion that under communism there will appear a new form of tyranny to dominate the individual: "Society, from which we have everything, is a new master, a new spook, a new 'supreme being', which 'takes us into its service and allegiance'!"[30] As he adds later: "Communism rightly revolts against the pressure that I experience from individual proprietors; but still more horrible is the might that it puts in the hand of the collectivity."[31]

In the second section, "I," Stirner explores his doctrine of the unique individual. What is left of the individual once he or she is liberated from the snares of philosophy, religion, culture, family, morality, the various forms of liberalism, the state, any political party, property—even love,

equality, and human rights? Concerning the last of these Stirner says: "Right—is a wheel in the head, put there by a spook; power—that am I myself, I am the powerful one and the owner of power."[32] Here the obscure and somewhat sinister side of Stirner's thought appears with its Nietzschean appeal to the power each individual possesses, its exercise, and the egoistic individual so created. He ends his book with a peroration to the power of the self-creating individual:

> I am *owner* of my might, and I am so when I know myself as *unique*. In the *unique one* the owner himself returns into his creative nothing, of which he is born. Every higher essence above me, be it God, be it man, weakens the feeling of my uniqueness, and pales only before the sun of this consciousness. If I concern myself for myself, the unique one, then my concern rests on its transitory, mortal creator, who consumes himself, and I may say: All things are nothing to me.[33]

In speaking of the property that the unique individual owns (viz., his or her own self-creative power), it is as if Stirner never got beyond the opening passages of Hegel's *Philosophy of Right,* summed up in, for example, § 47. There Hegel talks about the right of property which each has in their own person, i.e. in their body, and the will they exercise through their body. The ego and what it owns are both the beginning and end of Stirner's anarchistic political theory.

Even in his discussion of love Stirner adopts a completely egoistic position. Though he claims to love every other person he does so egoistically: "I love them because love makes *me* happy."[34] For an extreme individual egoist such as Stirner all forms of the state are to be resisted—the state, too, is a spook. However, he does feel the need to speak of an association or union of egoists; but it is hard to see what such a union is like for an extreme egoist. We are told: "it is not another State (such as a 'people's State') that men aim at, but their *union,* uniting, this ever-fluid uniting of everything standing."[35] Elsewhere he paints a bleak picture of what this ever-fluid union of egoists might be like:

> For me no one person is to be respected…but [each is] an *object* in which I take an interest or else do not…. And if I can use him, I doubtless come to an understanding and make myself at one with him, in order, by the agreement, to strengthen *my power,* and by combined force to accomplish more than individual force could effect. In this combination I see nothing whatever but a multiplication of my force, and I retain it only so long as it is *my* multiplied force. But thus it is a—union.[36]

Stirner may have raised some important critical points concerning Hegel and his fellow Young Hegelians and to have alerted us to the dangers in appeals to unanalysed abstractions such as "man" and "the state." However, he often bases his own positive theory of the freedom of the individual on a false inference from the need to be free of this and that particular thing (e.g. a political party, or the family, etc.) to the need to be free from everything. By combining the idea of absolute freedom from everything with the idea of the power that the individual can egoistically exert in making itself, Stirner is led to rather unsavory views about the kind of relationships people can have. Belatedly, Stirner recognizes the need for some association of egoists; but his theory of the union does not get beyond the Hobbesian state of nature. In the end he espouses views characteristic of twentieth-century right-wing and Fascistic movements:

> My intercourse with the world, what does it aim at? I want to have the enjoyment of it, therefore it must be my property, and therefore I want to win it. I do not want the liberty of men, nor their equality; I want only *my* power over them, I want to make them my property, *material for enjoyment*.[37]

No wonder a recent editor of an abridged version of Stirner's book thought it appropriate to include it in a general series with the title "Roots of the Right." Even Mussolini wrote: "Leave the way free for the elemental power of the individual; for there is no other human reality than the individual! Why shouldn't *Stirner* become significant again?"[38]

Marx and Stirner have, at a certain level, common themes; Stirner's graphic account of alienated labor is paralleled by Marx's own account of alienation given at the same time in his unpublished *Economic and Philosophic Manuscripts of 1844*. However, at a deeper theoretical level of the relationship between the individual and society Marx and Stirner are poles apart. For Stirner the states of mind of, and the powers exerted by, the egoistic individual are *sui generis* and are not to be further explained. In contrast, for Marx, as he developed his materialist view of history, the states of mind to which Stirner appeals are falsely treated as ultimate and are themselves things which stand in need of explanation. As Marx first said in *The German Ideology:* "It is not consciousness that determines life, but life that determines consciousness,"[39] where "life" is to be understood as people "developing their material production and their material intercourse" (*MECW, 5*:37). In particular Marx complains:

> Stirner regards the various stages of life only as "self-discoveries" of the individual, and these "self-discoveries" are moreover always reduced to a definite relation of consciousness. Thus the variety of

> *consciousness* is here the life of the individual. The physical and social changes which take place in individuals and produce an altered consciousness are, of course, of no conern to Stirner. In Stirner's work, therefore, child, youth and man always find the world ready-made, just as they merely "find" "themselves"…. But even the relation of *consciousness* is not correctly understood either, but only in its speculative distortion.
>
> (ibid.: 128)

Stirner's egoistic individual cannot merely be a person cultivating their unconditioned power unrelated to any circumstances whatever: "[Stirner] quite consistently abstracts from historical epochs, nationalities, classes, etc., [and] he inflates the *consciousness* predominant in the class nearest to him in his immediate environment into the normal consciousness of 'a man's life' " (ibid.: 129). Thus the unique I does not well up out of itself from nothing, as Stirner claims, but, according to Marx, is the product of circumstances to which the I remains blind.[40]

The only Young Hegelian to have exerted an influence on Marx was Ludwig Feuerbach. The nature and extent of Marx's relationship to the work of Hegel and the Young Hegelians have only been able to be fully assessed since the 1930s when the *MEGA* edition (1927–32) made available all of Marx's and Engels's early writings (i.e. before 1848). Before the 1930s the full range of Marx's thought on Hegel and the Young Hegelians and the extent of Feuerbach's influence were not known.

Marx says in his 1859 Preface to *A Contribution to the Critique of Political Economy* that in 1845 he and Engels had

> decided to set forth together our conception as opposed to the ideological one of German Philosophy, in fact to settle accounts with our former philosophical conscience. The intention was carried out in the form of a critique of post-Hegelian philosophy. The manuscript, two large octavo volumes, had long ago reached the publishers in Westphalia when we were informed that owing to changed circumstances it could not be printed. We abandoned the manuscript to the gnawing criticism of the mice all the more willingly since we had achieved our main purpose—self-clarification.
>
> (*MECW,* 29:264)

This manuscript, first published in full in 1932, is now known as *The German Ideology*.[41] The manuscript left to the mice was in Engels's hands again in 1886 when he leafed through it in the course of writing a review of a book on Ludwig Feuerbach. The review reappeared in 1888 as a separate pamphlet entitled *Ludwig Feuerbach and the End of Classical*

German Philosophy. In the Preface, Engels tells us that he had undertaken the earlier review willingly, since "a full acknowledgement of the influence which Feuerbach, more than any other post-Hegelian philosopher, had upon us during our *Sturm und Drang* period, appeared to me to be an undischarged debt of honour" (*MECW,* 26:520). In the first section of this work Engels treats us to his own brief version of the history of the development of German philosophy from Hegel until the 1848 revolutions. The crucial turning point for Hegelian philosophy was, according to Engels, the publication of Feuerbach's *The Essence of Christianity* in 1841:

> The spell was broken; the "system" [i.e. Hegel's] was exploded and cast aside, and the contradiction [between the Idea and nature], shown to exist only in our imagination, was dissolved. One must have experienced the liberating effect of this book for oneself to get an idea of it. Enthusiasm was universal: we were all Feuerbacheans for a moment. How enthusiastically Marx greeted the new conception and how much—in spite of all critical reservations—he was influenced by it, one may read in *The Holy Family*.
>
> (*MECW,* 26:364)

Engels's claim in the last sentence is at variance with the facts, as McLellan points out.[42] In *The Holy Family* Feuerbach's *The Essence of Christianity* is not mentioned, as a glance at the index will show. However the index lists two other works by Feuerbach published in 1843 that are arguably an equal or more important influence on Marx, viz., *Provisional Theses for the Reformation of Philosophy* and *Principles of the Philosophy of the Future*. Engels's 1888 pamphlet is important in another respect. In the Preface he also tells us that "in an old notebook of Marx's I have found the eleven theses on Feuerbach, printed here as an appendix. These are notes hurriedly scribbled down for later elaboration, absolutely not intended for publication" (*MECW,* 26:520). These, now known as the *Theses on Feuerbach,* along with *The German Ideology,* contain Marx's own critical evaluation of Feuerbach.

Marx had been aware of the work of Feuerbach from the time he wrote his dissertation (1840–1). At the beginning of 1842 he said in an article, comparing Feuerbach with Strauss, that "there is no other road for you to *truth* and *freedom* except that leading *through* the stream of fire [the *Feuer-bach*]. Feuerbach is the *purgatory* of the present times."[43] The significance of Feuerbach's work as a tool for the criticism of Hegel became apparent to Marx with the publication of Feuerbach's two 1843 works in which a program is set out for the future development of philosophy once Hegel's speculative philosophy had been abandoned.

However, Marx was aware of one important limitation of these works. He wrote to Ruge on 13 March 1843 concerning the *Provisional Theses:* "Feuerbach's aphorisms seem to me incorrect in only one respect, that he refers too much to nature and too little to politics. That, however, is the only alliance by which present-day philosophy can become truth" (*MECW,* 1:400). In the unpublished *Economic and Philosophic Manuscripts of 1844* Marx has only praise for the "theoretical revolution" that Feuerbach had wrought. The other Young Hegelians, especially Strauss and Bauer, are singled out for failing to appreciate that these two works have "in principle overthrown the old dialectic and philosophy." For Marx, "*Feuerbach* is the only one who has a *serious, critical* attitude to the Hegelian dialectic and who has made genuine discoveries in this field. He is in fact the true conqueror of the old philosophy."[44] It is only in subsequent, unpublished work that one can find Marx's criticisms of Feuerbach.

Feuerbach, who had met Hegel and attended some of his lectures, devoted much of his philosophical career to the study of religion. He gained notice with the publication of *Thoughts concerning Death and Immortality* (1830) in which he argued that there was no personal immortality and no transcendent God but, instead, only the immortality and transcendence of the human spirit. The reception of his book ended any hopes that he may have held for a permanent university position. With the publication of *Toward a Critique of Hegelian Philosophy* (1839)[45] Feuerbach became firmly identified with the Young Hegelians. This work is an attack on several major themes in Hegel's logic and metaphysics, particularly his idealism.

Among the many points concerning Hegelian philosophy that Feuerbach takes up in the *Critique* are the following, (a) In contrast to the idea that Hegelian philosophy is absolute because it is presuppositionless, he argues that, like all other philosophy, it too has its hidden presuppositions, (b) In contrast to Hegel's abstract notion of thought he claims that all thought involves interpersonal dialogue and that language itself is "the realization of the species." (c) Philosophy is bound up with communication and language and is not to be, as in Hegel, imprisoned and compressed into a system, (d) Even though Hegelian philosophy employs a critical method it fails to notice what Feuerbach calls the "genetico-critical philosophy" in which the causal origins of thought and ideas are traced, (e) Common Hegelian errors are to be rectified by turning the Hegelian subject into a predicate and, conversely, the predicate into a subject. This is the first statement of Feuerbach's famous *inversion principle* that so attracted Marx, (f) The Absolute is "a vague and meaningless predicate" and Hegelian philosophy is "rational mysticism." (g) Hegel's opposition of Being and Nothing is to be rejected (though Feuerbach's own arguments concerning Nothing sometimes fall into logical error).

The work which propelled Feuerbach into fame as the leading Young Hegelian was the publication in 1841 of *The Essence of Christianity*. The enthusiasm with which this work was greeted ranged from Engels's remark that "we were all Feuerbacheans for a moment" to Richard Wagner's claim that he "always regarded Feuerbach as the ideal exponent of the radical release of the individual from the thraldom of accepted notions."[46] While the body of the book illustrates how the genetico-critical method is applied to the analysis of religious belief, the Preface to the second edition tells us more about the manner in which Feuerbach's method differs from the approach of Hegel. Importantly Feuerbach views himself as "a *natural philosopher in the domain of the mind*" in applying his genetico-critical method not only to religious belief but to other sons of belief as well.

The genetico-critical method is not to be understood in the Humean manner in which *epistemological justifications* of our beliefs (i.e. thoughts) are to be sought by logically basing them in our impressions of experience. The method that Feuerbach employs has its roots more in the continental tradition of the interpretation of Locke. It is *genetic* in that it traces the *causal origin* of our beliefs back to their source in experience (but not in the sense of providing an epistemic justification by means of experience). It is *critical* in that it uncovers what is the real cause, as opposed to the commonly believed but false cause, of some of our beliefs. If a belief cannot be epistemically justified, the Humean response is to reject it as epistemically illegitimate; in contrast, such illegitimate beliefs are of prime concern for the genetico-critical method.

It is in this sense that Feuerbach sees himself as "a natural philosopher of the mind" investigating even the residue of our epistemically illegitimate beliefs. Feuerbach speaks in this context of the geneticocritical method being mainly concerned with "secondary" causes, citing as an example the theological view that comets are the work of God and contrasting this with the astronomer's or the natural philosophical view of their cause.[47] This example suggests that what we commonly take to be the cause of a phenomenon might be quite wrong and that there is some other "secondary" cause of the phenomenon which scientific investigation would reveal. It is Feuerbach's view that when it comes to the phenomenon of belief, particularly religious belief, we can be quite mistaken about what is the proper (i.e. secondary) cause of particular beliefs.

For Feuerbach religion provides a particularly fertile field for beliefs which have a causal origin in something quite distinct from their putative object. On Feuerbach's analysis, beliefs about God do not have their causal origin in God but in something quite different, viz., our human nature. As Feuerbach might say, human nature, not God, is the correct

"secondary" cause of our religious beliefs. Elsewhere Feuerbach talks of religious beliefs being *reduced* to beliefs about human essence and that God himself has been *reduced* to the essence of the human species. With hindsight the genetico-critical method can be viewed, in part, as an early exercise in the sociology of knowledge, or, much better, the sociology of belief, in which the origins of beliefs are traced to causes other than their putative objects.

Feuerbach's genetico-critical account of the source of our concept of God is at least as old as Xenophanes, who is reported to have said that if horses, cows, or lions could draw then they would draw their gods like horses, cows, or lions; i.e. we make our god(s) in our own image. For Feuerbach's reductive program every predicate of God is in fact a predicate of the human essence. It is we who then project God as an independently existing object onto the world; at the same time we believe that God created us—thus inverting the true but hidden causal relation.

In presenting his case for this inverted picture Feuerbach begins the first section of chapter 1 of *The Essence of Christianity* by describing the essential nature of man, i.e. those features which distinguish us essentially from other animals. We are told that the essence of man is such that each being "has consciousness in the strict sense"; such consciousness is "present only in a being to whom his species, his essential nature, is an object of thought." Feuerbach even claims that science, which has to do with species or kinds rather than individuals, is only possible for beings who can be conscious of their own species, i.e. their essential nature. Feuerbach continues his account of our essence by saying that such consciousness is also consciousness of the infinite. By means of a rather muddled argument he tells us that this means that "the conscious subject has for his object the infinity of his own nature." At best this cannot be the nature of the individual but of the species as a whole, though it does not strictly follow that even the species as a whole will necessarily have an infinite nature. In the course of this discussion Feuerbach introduces the notion of religion; this is, somewhat question-beggingly and without any accompanying argument, identified with our essence, i.e. "with the consciousness which man has of his nature."

When he comes to say what further properties our essential nature has it transpires that our essence is very Cartesian; the essential properties of the human species are reason, will, and affection. Thus our natures are such that we have the power to think, to act forcefully, and to love—and our power to do so as a species is allegedly infinite. Given that this is our essence, how does Feuerbach get from our essential nature to our concept of God? To ask this is to put the wrong question. Rather one must ask: given some feature alleged to be of God, how is this feature to be causally reduced, using the geneticocritical method, to features of our essence?

To assist in this Feuerbach appeals to his inversion principle, adapted to suit the special case of God: "the object [God] of any subject [man] is nothing else than the subject's own nature taken objectively."[48] That is, all the features we attribute to God, e.g. that God is loving, are nothing but features of our own nature—in this case the power we have of affection or love. We then project onto the world an independently existing object which has the power to love. From this Feuerbach concludes that our knowledge of God is nothing but knowledge of ourselves. However, he is careful to point out that the identity of God with man's essence is not something evident to us, for "ignorance of it [the identity] is fundamental to the peculiar nature of religion."[49] This is in effect Feuerbach's genetico-critical method applied to our beliefs about God. As Feuerbach himself later puts the matter, somewhat obscurely:

> Man—this is the mystery of religion—projects his being into objectivity, and then again makes himself an object to this projected image of himself thus converted into a subject; he thinks of himself is *[sic]* an object to himself, but as the object of an object, of another being than himself.[50]

At the end of Part I of his book Feuerbach does speak of his program in terms of reduction: "We have reduced the supermundane, supernatural, and superhuman nature of God to the elements of human nature as its fundamental elements."[51]

Feuerbach's attempt to be "a natural philosopher in the domain of the mind," especially for our beliefs about God, is not without its problems—not least of which is the use of the inversion principle to get his reductive account of God launched. Related to this is the alleged identity of God with the human essence. To establish this, what Feuerbach needs to show first is that our concept of God does not hold of any external being. Descartes recognized more clearly than Feuerbach the need to show, by argument, that our idea of God is an idea of some external existent entity (though it is generally recognized that Descartes's use of a version of the ontological argument does not prove this). Since Feuerbach is not fully aware of this Cartesian point he makes heavy weather in § 2 of chapter 1 of *The Essence of Christianity* of the question of whether God exists or not. Sometimes Feuerbach says that a God with features other than those of our human essence is not a God we would recognize, and so would not be a God for us. On other occasions he seems to suggest that where God lacks our human features then it follows that God does not exist, i.e. atheism is established.

Nor is Feuerbach particularly clear about whether, in reducing God to our human essence, he has shown that God is identical to our human

essence (somewhat in the style of Strauss) or that God does not exist and that he is a fantastic projection of ours upon the world. Often Feuerbach intends the latter, but sometimes his extreme atheism is tempered with the "divine humanism" of the former—this being the manner in which a number of contemporary theologians attempt to interpret Feuerbach. This is important because even if Feuerbach can show that our beliefs about God can be reduced to those about our human essence, it does not follow that there is no God. Whether or not God exists is left untouched by his genetico-critical method applied to religious concepts. Of course, for an already committed atheist the genetico-critical method might tell us something about why so much false religious belief still traffics its way through people's minds. This point brings out the important difference between the Humean *epistemic justification* of a belief and the genetico-critical method for tracing the *causal origin* of a belief. The justification for God's existence is quite independent of how people are caused to have the beliefs they do about God.

Setting aside these difficulties in his account of God, Feuerbach provides a bold and innovative attempt to employ the genetico-critical method to the case of our religious concepts. As will be seen, Marx did not accept Feuerbach's reductive account of religious belief; instead he put more emphasis on the functional role of our religious beliefs. But he did adapt the general reductive program, illustrated by Feuerbach's analysis of religion, to the concepts Hegel employs in expounding his theory about the state.

Feuerbach's two works published after *The Essence of Christianity* in 1843 exerted an important influence on Marx; these were *Provisional Theses for the Reformation of Philosophy* and *Principles of the Philosophy of the Future,* the latter being a more thoroughgoing treatment of themes of the former. Both works are set out in paragraphs, sometimes quite lengthy, and contain criticisms of Hegelian speculative philosophy while outlining a program for an alternative philosophy. The first paragraph of the *Provisional Theses* says:

> The secret of *theology* is *anthropology* but the secret of *speculative philosophy* is *theology,* the *speculative* theology. Speculative theology distinguishes itself from *ordinary* theology by the fact that it transfers the divine essence into this world. That is, speculative theology *envisions, determines,* and *realizes* in this world the divine essence transported by ordinary theology out of fear and ignorance into another world.[52]

This summarizes the project of *The Essence of Christianity*—but with the additional comment that the projection of God into another world is due

to our ignorance and fear. According to this thesis theology becomes part of anthropology, understood as the study of man and man's essence; the reduction of ordinary theology to anthropology is the province of what Feuerbach calls "speculative theology." Such a reductive'program also contains an important message for Hegelian speculative philosophy; it, too, can be reduced to anthropology:

> The method of the reformatory critique of *speculative philosophy in general* does not differ from the critique already applied in the *philosophy of religion*. We only need always make the *predicate* into the *subject* and thus, as the subject, into the *object* and *principle*. Hence we need only *invert* speculative philosophy and then have the unmasked pure, bare, truth.[53]

The *inversion principle* (as we have already called it), in which predicate and subject are interchanged, is not the most perspicuous of principles. Yet it is this principle, which some call Feuerbach's "transformative method," that most attracted Marx. It is unclear how the principle is to be applied in particular cases because what comprises the subject and predicate and the manner in which they are to be inverted are not always clear. Consider the following example of inversion given by Feuerbach in *The Essence of Christianity:*

> For, according to the principles which we have already developed, that which in religion is the predicate we must make the subject, and that which in religion is a subject we must make a predicate, thus inverting the oracles of religion; and by this means we arrive at the truth. God suffers—suffering is the predicate—but for men, for others, not for himself. What does that mean in plain speech? Nothing else than this: to suffer for others is divine; he who suffers for others, who lays down his life for them, acts divinely, is a God to men.[54]

It is obvious, contrary to what Feuerbach says, that "God suffers (for others)" does not mean the same as "whoever suffers for others is divine." However, in a slightly strained sense the subject "God" of the first sentence has become the predicate "divine" of the second sentence. Also the predicate "suffers" of the first sentence might be construed as the subject of the second sentence; but we must understand the subject of the second sentence not as Feuerbach expresses it, viz., as people (who suffer for others), but as suffering (which is other-directed). Whichever way we take the inversion we lose all reference to God as a subject of discourse. Instead what we talk of is either people who suffer for others,

i.e. sufferers (whose suffering is other-directed), or something slightly more abstract than individual people, viz., suffering, which is other-directed.

Feuerbach's reduction of the first sentence to the second via the inversion principle could be resisted on the grounds of lack of meaning equivalence. However, for those not ontologically committed to God, the reduction given might be acceptable, despite the lack of meaning equivalence. Feuerbach's procedure in this example is akin to those twentieth-century nominalists who eschew certain classes of abstract entity and who logically transform their discourse so that apparent references to undesirable abstracta are removed. While it would be out of place to see Feuerbach's inversion principle as an anticipation of some of the reductive or nominalistic moves of Russell or Quine, his procedure in the above example would not meet with their disapproval. We could without too much strain call Feuerbach's inversion a "nominalistic reduction" in that it relieves us of higher levels of abstract entity in favor of lower-level, more nominalistically acceptable items.

With this example of the inversion principle in mind, now consider the following two theses:

> The essence of theology is the *transcendent* essence of the human being, placed outside human beings. The essence of Hegel's *Logic* is *transcendent* thinking, the thinking of the human being *supposed outside human beings*.[55]

> "To abstract" means to suppose the *essence* of nature *outside nature,* the *essence* of the human being *outside the human being,* the *essence* of thinking *outside the act of thinking*. In that its entire system rests upon these acts of abstraction, Hegelian philosophy has *estranged* the human being *from its very self*.[56]

We have seen already how the inversion principle might work in the case of religious claims about God. It is also supposed to work in the case of thought and thinking; the apparent postulation of thought as a subject of predications becomes, by the inversion principle, a predicate, thinking, of other subjects, viz., people (who think) or thinkers. The reverse of the inversion principle is the process of abstraction, viz., the postulation of thought as a subject in its own right with an existence independent of people who think.

Feuerbach applies his inversion in detail only to religious beliefs but sketches ways in which it might be applied to Hegel's *Logic*. Toward the end of the *Provisional Theses* he suggests that the inversion principle can also be applied in political philosophy:

> All speculation about right, willing, freedom, personality without the human being, i.e. outside of or even beyond the human being, is speculation *without unity, without necessity, without substance, without foundation, and without reality*. The human being is the existence of freedom, the existence of personality, the existence of right.[57]

Feuerbach's programmatic claim that the inversion principle can be used to analyze Hegelian political philosophy attracted Marx when he read the *Provisional Theses*. Though Marx had been studying Hegel's *Philosophy of Right* before this, the *Provisional Theses* gave him a new critical tool with which to approach it. He also took to heart, as will be seen, the message of another thesis: "The beginning of philosophy is not God and the beginning of the absolute is not the absolute, not being as a *predicate* of the idea. The beginning of philosophy is the finite, the determined, the actual."[58]

It is impossible to deal adequately here with Marx's detailed paragraph-by-paragraph critique of Hegel's *Philosophy of Right* found in his Feuerbach-inspired *Critique of Hegel's "Philosophy of Right"*.[59] Instead a few examples must suffice. Marx's surviving manuscript begins with § 262 of Hegel's *Philosophy of Right:*

> The actual Idea is mind, which, sundering itself into the two ideal spheres of its concept, family and civil society, enters upon its final phase, but it does so only in order to rise above its ideality and become explicit as infinite actual mind. It is therefore to these ideal spheres that the actual Idea assigns the material of this its finite actuality, viz., human beings as a mass, in such a way that the function assigned to any given individual is visibly mediated by circumstances, his caprice and his personal choice of his station in life.[60]

Often Marx begins the criticism of a section from Hegel by translating it into ordinary prose, removing its stylistic peculiarities; this section is no exception. Marx notes that the actual Idea (mind as infinite and actual) is taken to be something, a subject, that has its own powers to evolve toward a determinate end; moreover it sunders itself into "two ideal spheres," viz., family and civil society. The Idea, which is distinct from family and civil society, makes these into dependent existences; they are finite determinations of the Idea which arise from the Idea's own processes. This Marx condemns as "logical, pantheistic mysticism."

Both following Feuerbach's directive to begin with the "finite and determined" rather than the Absolute, and using the inversion principle,

Marx begins instead with the mass of human beings. It is they who make up families and civil society and these in turn are modes of existence of the state: "family and civil society make *themselves* into a state. They are the active force."[61] Speculative Hegelian philosophy treats this wrongly as an achievement of the Idea-subject, its aim being to "become explicit as infinite actual mind." According to Marx: "The entire mystery of the *Philosophy of Right* and of Hegelian philosophy in general is contained in these paragraphs."[62] Marx demystifies § 262 when he rewrites it as: "The family and civil society are elements of the state. The material of the state is divided amongst them through circumstances, caprice, and personal choice of vocation. The citizens of the state are members of families and of civil society."[63]

It is hard to see in Marx's demystified rendering of Hegel's § 262 the precise application of the inversion principle. The Idea as a selfacting subject does not reappear as a predicate. It has disappeared and in its place are new subjects, viz., the masses of people, the family, civil society; they make up the state and, as Marx says, "are the active force." Rather it seems more accurate to view Marx's alleged use of the inversion principle in this case as a reductive nominalizing move in which mystifying abstracta, such as the actual Idea with its powers, are replaced by more concrete talk of the mass of people, the family, civil society, and their powers. The last item, civil society, may itself be somewhat abstract but it is not as obnoxiously so as the actual Idea. How does Marx's desire to rid social theory of abstracta affect his own social ontology? As is well known, the ontology of Marx's later historical materialism, first set out in *The German Ideology,* came to include not abstracta of the sort just mentioned but relational items such as relations of production, and, in some cases, forces of production. The postulation of such relational items in no way counts against Marx's reductive nominalism when used as a critical tool to demystify Hegel's theory which is populated by obscure abstract entities (or as Stirner would say, by spooks).

Sometimes Marx does not employ the inversion principle in his criticisms of Hegel. Thus he complains, in commenting on § 278, that where Hegel says "The sovereignty of the state is the monarch" the common man would say "The monarch has the sovereign power, or sovereignty." This is a straightforward nominalizing move in which the definite description of the first sentence is eliminated in the less mystifying second sentence said by the common man, thereby making it quite clear where the power lies. However, elsewhere in his lengthy comments on § 278 Marx quite explicitly formulates the inversion principle several times in the course of developing his criticism of Hegel on sovereignty. Thus he cavils at Hegel's reification of sovereignty when he says:

> Accordingly, sovereignty, the essence of the state, is here first conceived to be an independent being; it is objectified. Then, of course, this object must again become subject. However the subject then appears to be a self-incarnation of sovereignty, which is nothing but the objectified spirit of the state's subjects.[64]

And so on for other Hegelian reifications, for example, concerning patriotism or the constitution, that Marx ferrets out of *The Philosophy of Right*.

Marx has criticisms to make of Hegel's political philosophy that do not depend on Feuerbach's inversion principle; but its application does relieve one from much that is mind-numbing in Hegel's theory. As a number of commentators have pointed out,[65] the nominalizing moves leave untouched the empirical content of Hegel's claims. This is obviously the case in the above transformation of what Hegel says about sovereignty into what the common man would say. Even though Marx elsewhere makes empirical objections to Hegel's theory (e.g. about the function of primogeniture), the inversion principle, in leaving untouched empirical matters, exposes only the pseudo-profundity of Hegel's mystifying presentation of these empirical matters. As Feuerbach put it in another thesis:

> To have articulated what is *such as it is,* in other words, to have *truthfully* articulated what truly is, *appears superficial*. To have articulated what is *such as it is not,* in other words, to have *falsely* and *distortedly* articulated what truly is, *appears profound*.[66]

Often Marx and Engels assume in criticizing Hegelian speculative philosophy that they are entitled to drop the epithet "Hegelian speculative" and conclude that all philosophy-is similarly flawed. However, all they have shown is that one kind of philosophy, Hegel's, is defective. Marx's reductive nominalizing moves are of a piece with much of the logical critique of language developed in twentieth-century analytic philosophy.

Aspects of Feuerbachian, and even Hegelian, influence can be found in another work that Marx left incomplete and so unpublished in his lifetime, now known as the *Economic and Philosophic Manuscripts of 1844*. This is Marx's most humanistic work, particularly in its exploration of the notion of alienation. But within a year Marx explicitly rejected much of Feuerbach's philosophy, including his account of human essence, his critical analysis of religion, and his version of materialism. In *The German Ideology* (1845–6) Marx became impatient with all attempts to define the essential properties of human beings in terms of consciousness and its forms. Without referring directly to Feuerbach he says:

> Men can be distinguished from animals by consciousness, by religion or anything else you like. They themselves begin to distinguish themselves from animals as soon as they begin to *produce* their means of subsistence, a step which is conditioned by their physical organization.
>
> (*MECW,* 5:31)

But this is not adequate because it leaves out the possibility of humans living in hunter-gatherer societies in which there is no production of means of subsistence. Nor does it take into account the possibility of either biological attempts to specify the human essence, or biochemical attempts in terms of our DNA structure.

Marx did not entirely abandon all talk of necessary features of humanity even in *Capital:*

> So far therefore as labour is a creator of use-value, is useful labour, it is a necessary condition, independent of all forms of society, for the existence of the human race; it is an eternal nature-imposed necessity, without which there can be no material exchanges between man and Nature, and therefore no life.[67]

In the first sentence Marx speaks only of labor as a necessary condition for our existence, and not as our essence. However, in the second sentence he seems to make a much stronger claim when he talks of labor as "an eternal nature-imposed necessity" upon human beings. But all this means is that, given the way the actual world is, we humans must always labor if we wish to exist. Perhaps there are possible worlds in which nature itself is so bountiful that it produces all that would be needed for human existence without any labor on our part. If so, and if we take an essential property of a species to be one without which the species *cannot* exist, then labor is not an essential property of the human species; rather it is a necessary condition of our existence given that in the *actual* world we must work in order to live. Thus in the absence of a different theory of essence in Marx (and in Feuerbach) the above quotation does not entail that labor is an essential feature of human beings.

Marx makes no mention in the above quotation of consciousness. But elsewhere in *Capital* he does appeal to consciousness as that which differentiates us from the animals. In discussing "the labour process independently of the particular form it assumes under given social conditions" he says, when comparing human labor with spiders as makers of webs or bees as makers of cells: "But what distinguishes the worst architect from the best of bees is this, that the architect raises his structure in imagination before he erects it in reality."[68] However, not every laborer

raises the product of their labor in their imagination before they make it. This point aside, Marx claims that what distinguishes humans from animals is imagination—a form of consciousness. Even though the kind of consciousness that Marx appeals to is different from the consciousness Feuerbach alleges is our human essence, their claims have this much in common: there exists an essential feature which differentiates humans from the animals.

The above becomes significant when we consider the sixth and seventh of the *Theses on Feuerbach* (1845):

(6) Feuerbach resolves the essence of religion into the essence of *man*. But the essence of man is no abstraction inherent in each single individual. In its reality it is the ensemble of the social relations. Feuerbach, who did not enter upon a criticism of this real essence, is hence obliged:

1 To abstract from the historical process and to define the religious sentiment by itself, and to presuppose an abstract—*isolated*—human individual.

2 Essence, therefore, can be regarded only as "species", as an inner, mute, general character which unites the many individuals *in a natural way*.

(7) Feuerbach, consequently, does not see that the "religious sentiment" is itself a social product, and that the abstract individual which he analyses belongs to a particular form of society

(*MECW, 5*:4–5)

Thesis (6) begins with a pithy summary of Feuerbach's view of religion, but then challenges it by denying that there is any Feuerbachean essence and, more strongly, that there is a human essence at all. For Marx there is nothing intrinsic to each person, or to humanity as a whole, which is their individual or species essence. Rather, if Marx is going to admit talk of essences at all, then the "essence" of each person will arise from something external to each. According to Thesis (6) each member of the human species exists in some specifie ensemble of social relations, different ensembles of social relations existing at any one time and over time. Individual humans, among other things, are the relata, the items that stand in the relations in the ensemble. Moreover the items related do not retain their important characteristics from one ensemble of relations to another since the ensemble plays an important role in "shaping" the characteristics of the items in the relata. Both the relata and the ensemble of relations must be taken together and cannot be easily separated out into relata and relations. That is, the relations are, in some sense, intrinsic to the relata and not extrinsic. (This raises a problem about the extent to which the relata and the ensemble of relations affect one another, which Marx attempts to address in Thesis (3); it will not be discussed here.)[69]

The views Marx expresses in Thesis (6) are of a piece with the remark already cited from *The German Ideology:* "It is not consciousness that determines life, but life that determines consciousness." It follows that the forms of consciousness that people have are "determined" by the ensemble of social relations of which they are the relata, and the forms of consciousness change with change in the ensemble. Thus on Marx's view there can be no common forms of consciousness to which Feuerbach can appeal as the essence of humankind across all the ensembles of relations in which humans can exist—especially emotional features such as suffering for others which Feuerbach mentions. This is not the place to assess this central claim of Marx's materialist view of history; but it does highlight the reasons why Marx rejects essentialist views of human nature.

The two theses are also important for the light they cast on Marx's view of religion. For Feuerbach the reductive base of religion is the human essence. In contrast there is no such universal reductive base for Marx; so he must reject Feuerbach's genetico-critical analysis of religion. Since the ensemble of relations, i.e. society, is alleged by Marx to determine consciousness, the very features of human beings that Feuerbach alleges to be our human essence, i.e. our forms of consciousness, are not *sui generis* and stand in need of explanation. In effect Marx shifts the reductive base from human essence to the ensemble of relations, i.e. society as a whole. Marx expresses just this in his "Contribution to the Critique of Hegel's *'Philosophy of Right'*: introduction": "This state, this society, produce religion, an *inverted world-consciousness"* (*MECW,* 3:175). This is, in part, Feuerbach inspired; however, it is in the society that "produces" religion, not our human essence. A little further on Marx talks of religion as "the opium of the people" and of the abolition of religion as "the demand to give up illusions about the existing state of affairs" which in turn is "the demand to give up a state of affairs which needs illusions."

It is now commonplace to look for functional explanations of the role of religious belief in the overall fabric of society. For example, the function of religion might be to provide an illusion, e.g. religious consolation or the postulation of a better afterlife, for a state of affairs that needs an illusion, in this case the suffering that people experience as a result of poverty or war. Or religion might have, as Marx suggests in *The German Ideology,* the function of maintaining a form of the division of labor in a given society:

> When the crude form of the division of labour which is to be found among the Indians and the Egyptians calls forth the caste-system in their state and religion, the historian believes that the caste-system is the power which has produced this crude form.
>
> (*MECW,* 5:55)

It is a long-standing issue of interpretation to reconcile Marx's claim here that, on the one hand, the state of society "produces" or "calls forth" religion, and, on the other, the claim he makes elsewhere that religion (e.g. the religious caste system) can help maintain the state and its relations of production (in this case the division of labor represented in the caste system). Cohen has argued that the tension between "producing" and "maintaining" can be resolved by adopting a functional account of the explanation that social factors can give of religious belief [70] If this is the case then Marx's functional explanation of religious belief is quite distinct from Feuerbach's account of religion; however, both still hold that religion is a form of illusion.

Marx also rejects Feuerbach's version of materialism. Feuerbach provides an explicit, though muddled, statement of his empiricist materialism in his *Principles of the Philosophy of the Future,* § 32: "The real in its reality or taken as real is the real as an object of the senses; it is sensuous. Truth, reality, and sensation are identical. Only a sensuous being is a true real being."[71] Crudely put, this asserts that something is real if and only if it can be sensed (by us humans). When it comes to the theory of perception Marx understands Feuerbach to hold the simple *tabula rasa* view in which the mind is a passive receptacle for sense impressions produced by objects and by our feelings. Marx criticizes this, along with other "old" versions of materialism in contrast to his "new" version of materialism, in the first of the *Theses on Feuerbach:*

> The chief defect of all previous materialism (that of Feuerbach included) is that things, reality, sensuousness are conceived only in the form of the *object, or of contemplation,* but not as *sensuous human activity, practice,* not subjectively. Hence, in contradistinction to materialism, the *active* side was set forth *abstractly* by idealism—which, of course, does not know real, sensuous activity as such. Feuerbach wants sensuous objects, really distinct from conceptual objects, but he does not conceive human activity itself as *objective* activity. In *The Essence of Christianity,* he therefore regards the theoretical attitude as the only genuine human attitude, while practice is conceived and defined only in its dirty-Jewish form of appearance. Hence he does not grasp the significance of "revolutionary", of "practical-critical", activity.
>
> (*MECW, 5*:3)

Much critical ink has been spilt on this thesis.[72] For our purposes we need note only the following. In the second sentence Marx appeals to "idealist" theories of knowledge, such as those advocated by German Idealist philosophy from the time of Kant, in which the knower makes an active

contribution to perceptual knowledge; the knower actively synthesizes what the senses passively present to him or her in order that the knower can have knowledge of empirically given objects such as chairs or the moon. In this sense Feuerbach is out of step with the idealist tradition concerning ordinary perceptual knowledge in omitting reference to this activist side of idealist epistemology.

But Marx also adds that both Feuerbach and the idealist tradition miss an important aspect of the way in which human activity "constructs" the objects of which we are sensuously aware; this is a central feature of his materialist view of history. In a section of *The German Ideology* (for which editors of this work usually provide a heading such as "Feuerbach's Contemplative and Inconsistent Materialism"), Marx criticizes Feuerbach for having too "contemplative" or too passive a view of our relationship with the objects that exist in the world. The plain fact, claims Marx, is that even the ordinary chairs and tables commonly appealed to as objects of perception by the epistemologist are human creations. Most of the world in which we live is a human-created world; it is our industry over thousands of years that has produced most of the objects which surround us. Even the common cherry tree is a product of human husbandry, a result of "human activity" or "practical-critical activity" as Marx puts it in Thesis (I). Science is also an important part of this practical-critical activity transforming even more thoroughly and rapidly the world in which we live. This does not mean that there is no external world: "Of course, in all this the priority of external nature is unassailed" (*MECW,* 5:40); but, adds Marx, perhaps only a few Australian coral islands are untouched by human activity. It is the man-nature interaction, emphasized throughout all of Marx's subsequent writings, that has produced our everyday world. It is this that the old materialists and Feuerbach omit totally and that the idealists treat in a one-sided manner by ignoring *objective* human activity in producing the world in which we live. In summary Marx says: "As far as Feuerbach is a materialist he does not deal with history, and as far as he considers history he is not a materialist" (ibid.: 41).

As important as Marx's point is, it fails to address the traditional philosophical problem about the perception of ordinary objects, even if they are human-made chairs. The traditional epistemological problem was of little interest to Marx. Instead he was interested in our practical interaction with the world, how it "revolutionizes" the world and how this is reflected in our discourse about the world. (This is a reorientation of the traditional epistemological problem taken up in some respects by the later Wittgenstein.) The last two sentences of Thesis (1) emphasize this, but in a curious way. The reference to Feuerbach's *The Essence of*

Christianity takes us to Chapter 14 of that work in which a contrast is made between "the Greeks [who] looked at nature with the theoretic sense" and the Israelites who "opened to Nature only the gastric sense." In support of this Feuerbach quotes the Bible passage in which it is said that after Moses and the seventy elders ascended the mountain "they saw God; and when they had seen God they ate and drank." Since the sight of God excites in the Jews the appetite for food, Feuerbach claims that the Jewish religion involves "the most practical principle in the world—namely egoism."[73] Later Feuerbach goes on to praise the theoretical attitude of the Greeks as joyful, happy, and aesthetic, while the practical attitude, exemplified by the Jews, is unaesthetic and "is not pure [*schmutzig*—dirty], it is tainted with egoism."[74] Thus Marx was not making an anti-Semitic remark[75] in talking about practice in "its dirty-Jewish form"; rather he was having a dig at Feuerbach for failing to grasp that much of our relationship with the world is not theoretical but bound up in our practical activity, which may be "dirty" and in which egoism may play a part.

Feuerbach's contemplative epistemology omits any role for human practical activity. In contrast Marx's materialistic view of history puts strong emphasis on the practical activity of humans as they labor to produce their means of existence, activity which Marx calls "revolutionary" in Thesis (I). In the final thesis of his *Principles of the Philosophy of the Future*, Feuerbach's proposals for reform remain entirely within the realm of philosophy:

> So far, the attempts at philosophical reform have differed more or less from the old philosophy only in form, but not in substance. The indispensable condition of a really new philosophy, that is, an independent philosophy corresponding to the needs of mankind and of the future, is, however, that it will differentiate itself in its essence from the old philosophy.[76]

It is surely this passage that Marx has in mind when in the eleventh of his *Theses on Fenerbach* he rejects reform merely at the level of speculative philosophy and emphasizes not only human practical activity in transforming the world but also the revolutionary character of that activity: "The philosophers have only *interpreted* the world in various ways; the point, however, is to *change* it."[77]

For Marx the Young Hegelians provided a range of theories, many still current, about the individual and society which rivaled his own developing theory of historical materialism. His criticisms of the Young Hegelians, though often buried in now irrelevant polemical points, provide a useful survey of the responses a socialist might make to these rival theories. By

1846 the views of Marx and Engels on history and politics had matured to the point where they could fully distance themselves from not only Hegelian political theory but also the theories of all of the Young Hegelians. Marx declared not only that "the decomposition of the Hegelian system, which began with Strauss, has turned into a universal ferment" but also that the Young Hegelian movement was a "philosophic charlatanry," was "parochial" and "tragicomic" in its pretensions, and represented "the putrescence of the absolute spirit."[78] In his view the Young Hegelians had not comprehensively criticized Hegel's system; they had merely played off one part against another. Moreover they had not fully given up religious conceptions of people and their circumstances. Thus their thought was confined to merely ideological accounts of people and their circumstances:

> Since the Young Hegelians consider conceptions, thoughts, ideas, in fact all the products of consciousness, to which they attribute an independent existence, as the real chains of men (just as the Old Hegelians declare them the true bonds of human society), it is evident that the Young Hegelians have to fight only against these illusions of consciousness. Since, according to their fantasy, the relations of men, all their doings, their fetters and their limitations are products of their consciousness, the Young Hegelians logically put to men the moral postulate of exchanging their present consciousness for human [Feuerbach], critical [Bauer], or egoistic [Stirner] consciousness and thus of removing their limitations.
>
> (*MECW*, 5:30)

After this Marx continues in a manner not unrelated to his eleventh thesis on Feuerbach: "This demand to change consciousness amounts to a demand to interpret the existing world in a different way, i.e. to recognize it by means of a different interpretation." We are now familiar with such radical changes in the way we understand the world through Kuhn's talk of "paradigm shifts" or through recent French philosophy in which much is made of "epistemological breaks." Marx had undergone a change in his understanding of the connections between human beings and society more radical than any of his contemporary Young Hegelians. The above harsh judgments concerning his contemporaries sprang from the self-clarification he had achieved in setting out for the first time the materialist conception of history as opposed to the ideological conception of history in which he believed Hegel and the Young Hegelians were hopelessly enmeshed.

12 Ibid., p. 228.
13 Ibid., p. 230.
14 This material, which was untitled by Marx, is commonly, but not always, known in English as "Critique of Hegel's *'Philosophy of Right'*." It was published by D.Rjazanov in Vol. 1 of *Karl Marx, Friedrich Engels: HistorischKritisch Gesamtausgabe* (Frankfurt/Main and Berlin, 1927–32); henceforth referred to as *MEGA*. See also *Karl Marx and Friedrich Engels: Collected Works* (London: Lawrence & Wishart, 1975–), henceforth referred to as *MECW*, Vol. 3, "Contribution to the critique of Hegel's philosophy of law," pp. 3–129. The two Hegel critiques, the one Marx published and the drafts he left unfinished, are collected together, with a useful commentary, in Marx, *Critique of Hegel's "Philosophy of Right"*, ed. J.O'Malley (Cambridge: Cambridge University Press), 1970.
15 *Hegel's Philosophy of Right*, op. cit., p. 11.
16 *MECW: Karl Marx and Friedrich Engels: Collected Works*, op. cit.; citations are by volume and page number.
17 A few extracts from this work are available in English in Stepelevich, op. cit., pp. 177–86; the quotation is from p. 183.
18 B.Bauer, "The genus and the crowd," in ibid., pp. 204–5. The German title of the work is "Die Gattung und die Masse"; the term *"Gattung"* was extensively used by Feuerbach and is often translated into English as "(human) species" rather than "genus."
19 See Marx's distinction between crude communism and other forms of

communism in *MECW,* 3, pp. 294–7; see also S.Avineri, *The Social and Political Thought of Karl Marx* (Cambridge: Cambridge University Press, 1968), pp. 220–39.
20 See *MECW*, 3, pp. 231–4, Preface, and the concluding section p. 327.
21 D.McLellan, *The Young Hegelians and Karl Marx* (London: Macmillan, 1969), p. 78.
22 See "Part III: Saint Max" of Marx and Engels, *The German Ideology, MECW,* 5, pp. 117–450. In contrast Marx devotes only pp. 27–93 to a critique of Feuerbach, the Young Hegelian generally held to have had some influence upon him.
23 McLellan, op. cit., pp. 129–36.
24 For an account of Stirner's influence, see the Introduction by J.Carroll to his abridged edition of *Max Stirner: The Ego and Its Own* (London: Cape, 1971); this appeared in a series entitled Roots of the Right under the general editorship of G.Steiner.
25 M.Stirner, *The Ego and his Own* (1844), ed. J.Carroll, trans. S.T.Byington (London: Cape, 1971), p. 5.

CHAPTER 10

Arthur Schopenhauer

Kathleen M.Higgins

Despite a recent surge of philosophical interest, Arthur Schopenhauer remains one of the most underappreciated philosophers of modern times. He has arguably had a greater influence on subsequent philosophy and intellectual history than any other figure. The richness of Schopenhauer's thought is suggested even by a perusal of the intellectual world's reactions. Friedrich Nietzsche, Ludwig Wittgenstein, Sigmund Freud, Thomas Mann, Thomas Hardy, Richard Wagner, and Woody Allen all claim him as their intellectual and/or spiritual ancestor. Such influential concepts as Wittgenstein's "family resemblance,"[1] Nietzsche's "will to power"[2] and "eternal recurrence,"[3] and Freud's "libido"[4] all develop from ideas originally suggested by Schopenhauer.

Yet Schopenhauer's philosophy has often been dismissed as being of mere historical interest. One explanation is that Schopenhauer is an emphatically systematic thinker. In claiming that his philosophy is an "organic" whole, composed of elements that stand or fall together, Schopenhauer invites the reader who rejects a part of it to reject the theory *in toto*.[5] In light of his insistence on complete resignation, extreme asceticism, and sexual abstinence as the only alternative to a life of futile struggling, many readers understandably balk at embracing his theory wholesale.

Another explanation for Schopenhauer's unpopularity is the reaction of many readers to his personality. Bertrand Russell, who criticizes Schopenhauer's philosophy for "inconsistency and a certain shallowness," seems most indignant about Schopenhauer's character. After complaining about the internal tensions in Schopenhauer's doctrine of resignation, Russell continues:

> Nor is the doctrine sincere, if we may judge by Schopenhauer's life.

> He habitually dined well, at a good restaurant; he had many trivial love-affairs, which were sensual but not passionate; he was exceedingly quarrelsome and unusually avaricious. On one occasion he was annoyed by an elderly seamstress who was talking to a friend outside the door of his apartment. He threw her downstairs, causing her permanent injury. She obtained a court order compelling him to pay her a certain sum (15 thalers) every quarter as long as she lived. When at last she died, after twenty years, he noted in his account-book: "Obit anus, abit onus." ["The old woman dies; the burden departs."] It is hard to find in his life evidence of any virtue except kindness to animals, which he carried to the point of objecting to vivisection in the interests of science. In all other respects he was completely selfish.[6]

Russell's sense of virtue is probably quite different from Schopenhauer's. But even if Russell is not entirely fair in his attack, Schopenhauer's biography suggests grounds for *ad hominem* attack. Russell's anecdote alone suggests an impulsive, willful personality, a matter worth comment in one convinced, as is Schopenhauer, that Will is the fundamental metaphysical principle of the world.[7] Schopenhauer's system and, in particular, his denunciation of sex as the focal expression of the will and guarantor of human unhappiness prompt Nietzsche to remind his readers:

> In all questions concerning the Schopenhauerian philosophy, one should, by the bye, never lose sight of the consideration that it is the conception of a youth of twenty-six, so that it participates not only in what is peculiar to Schopenhauer's life, but what is peculiar to that special period of his life.[8]

Whether or not one considers such *ad hominems* to be legitimate in philosophical argumentation, Schopenhauer's writings present a psychological puzzle.[9] Although misanthropic and barbed in his tone, Schopenhauer advocates an ethic of compassion. Despite his elitism, he insists that all individuals are manifestations of the identical Will. Consistently analyzing the world's phenomena as manifestations of futility, Schopenhauer nonetheless describes them with voluptuous enthusiasm. He displays great wit and insight into human behavior—and yet he shows no sign of self-irony. Perhaps it was this last feature of Schopenhauer's work that moved the youthful Nietzsche to describe him as motivated by the need "for love above everything else."[10]

SCHOPENHAUER'S LIFE AND WORKS

Schopenhauer's biography at least sheds light on his intellectual breadth. Schopenhauer was born in Danzig on 22 February 1788 to a cosmopolitan couple, consisting of Heinrich Floris Schopenhauer, a prominent merchant, and Johanna Henriette Trosiener, a successful novelist. Heinrich's penchant for travel and unconventional views on schooling led to Schopenhauer's receiving a rather nomadic education. He lived in Hamburg from ages 5 to 9, spent the following two years in France, and subsequently spent two more years traveling the world with his parents and sister, briefly attending a British boarding school in Wimbledon. As a result of this globe-trotting lifestyle, Schopenhauer developed fluency in several languages and his own predilection for travel.

Schopenhauer's father died, apparently through suicide, when Schopenhauer was 17. Schopenhauer briefly attempted to fulfill a promise to his father that he would become a merchant; but concluding after two years that this career choice didn't suit him, he abandoned that career for classical studies. He began these at Gotha, but transferred to Weimar, where his mother lived. Schopenhauer and his mother were constant antagonists who could not bear to live in the same house. Indeed, Schopenhauer's misogynist comments, directed in particular at the modern "ladies" of Europe, may stem from this relationship to his mother.[11] Despite his dislike for her, however, Schopenhauer frequently visited her and her salon during this period, which included some of the most celebrated literary figures of the time (Goethe, Schlegel, and the brothers Grimm among them).

When he received his considerable inheritance at the age of 21, Schopenhauer began medical studies at the University of Göttingen. His growing interest in philosophy prompted him to transfer to the University of Berlin, where Fichte was professor. Schopenhauer found the lectures of both Fichte and his colleague Schleiermacher wanting, however, a conclusion reiterated in footnotes to virtually all of his subsequent works.

The proximity of battle during the Napoleonic Wars prompted Schopenhauer's next move, to a small town called Rudolstadt, near Weimar. There he wrote his dissertation, *On the Fourfold Root of the Principle of Sufficient Reason* (1813), which was awarded the doctorate by the University of Jena. Schopenhauer's private printing of the thesis did not win him a large readership. Nevertheless, Goethe read and praised it. In response to their subsequence conversations, Schopenhauer wrote a short book entitled *On Vision and Colors* (1815).

After returning to Weimar and briefly living with his mother, Schopenhauer completely severed his relation with her, never to see her

again. He moved to Dresden, where he wrote the central statement of his philosophical theory, *The World as Will and Representation* (1818). The book was by no means a bestseller, but Schopenhauer's publication record was strong enough to gain him a lectureship in philosophy at the University of Berlin. Hegel, object of Schopenhauer's considerable scorn, had inherited Fichte's chair. By scheduling his courses at times when Hegel was also lecturing, Schopenhauer forced his students to choose between himself and Hegel. The predictable result was that the students chose Hegel, with the consequence that Schopenhauer's lectures were canceled. The independently wealthy Schopenhauer never again sought an academic position; indeed, he consistently disparaged academic philosophy in his writings.

The cholera epidemic that killed Hegel in 1831 inspired the somewhat hypochondriacal Schopenhauer to make his final move, this time to Frankfurt. He devoted his remaining years to writing and traveling. His works of this period include "On the Will in Nature" (1836) and "On the Foundation of Morality," which were conjoined in *The Two Fundamental Problems of Ethics* (1841); the second edition of *The World as Will and Representation,* together with a second volume of supplementary essays (1844); a revised and enlarged edition of *On the Fourfold Root of the Principle of Sufficient Reason* (1847); and a collection of essays entitled *Parerga and Paralipomena* ("Supplementary Works and Omitted Material") (1851). Schopenhauer lived to see his works become popular in his waning years. He died on 21 September 1860.

SCHOPENHAUER'S GRAND SYNTHESIS

Schopenhauer's principal statement of his philosophical system is *The World as Will and Representation,* Volume I. Although he added subsequent essays in the years following its publication, these only elaborated on positions he initially stated in that volume. Schopenhauer never disavowed any detail of his initial formulations. As he announced in his Preface to the book's second edition: "I have altered nothing."[12]

Schopenhauer's Preface to the first edition of *The World as Will and Representation* reveals a demanding author. Schopenhauer insists that the book is the development of a single thought, and that the first chapters depend as much on the last as the other way around. Hence, he insists that the reader must read the entire book twice. In addition, since he is presupposing the work he had done in his dissertation, Schopenhauer also requires that his readers be familiar with *On the Fourfold Root of the Principle of Sufficient Reason* (and ideally with *On Vision and Colors* as

well). Finally, he requests that the reader have thorough familiarity with the writings of Kant, and preferably with Plato's dialogues and the *Upanishads* as well.

These last requirements give a hint as to what will follow. Schopenhauer's system aims to synthesize the philosophies of Kant, Plato, and India (in particular Buddhistic philosophy). The common denominator of the three is a distinction between the world of everyday appearances and a truer reality, ascertainable by the human mind. In order to accomplish his grand synthesis, Schopenhauer has to modify considerably the works from which he draws inspiration. Nonetheless, it is noteworthy that for all his curmudgeonly complaints about most other human beings, Schopenhauer expresses awe for his heroes.[13] (In fact, he decorated his rather sparse living quarters in Frankfurt with a bust of Kant and a statue of the Buddha.)[14]

The essential moves involved in Schopenhauer's synthesis are as follows. Schopenhauer accepts Kant's distinction between the phenomenal world and the noumenal world. The former is called, in Schopenhauer's idealistic scheme, the **world as representation,** for it is composed of objects constituted by the forms imposed by the conscious mind. The noumenal world, or thing-in-itself, is the reality underlying the world as representation. Schopenhauer disagrees with Kant that the thing-in-itself is inaccessible to us. Instead, he points out that each of us, in our own case, recognizes an immediate reality behind the phenomenal behavior of our own body. This inner reality is "will." Schopenhauer extends this inner reality to all phenomena, concluding that **"Will"** is the thing-in-itself.[15]

Although the entire phenomenal world is a manifestation of "Will," Schopenhauer maintains that the Will manifests itself to various degrees in different types of things. He invokes the Platonic Ideas (or Forms) to account for the different forms of the Will's manifestation. Following Plato, he argues that everyday human awareness usually focuses on particular things, not on their eternal, universal prototypes. However, in aesthetic experience, the individual sees the object as the Platonic Idea, and in the process raises him- or herself to the condition of "the universal subject of knowledge." In aesthetic experience, the willful character of our inner life is silenced. Aesthetic experience, therefore, affords the human being brief moments of inner peace.

Schopenhauer places high value on inner peace, and this valuation prompts him to incorporate insights from Indian philosophy into his system. Although the Will is the fundamental metaphysical principle behind all phenomena, its internal struggling character ensures that its phenomenal manifestations will themselves be characterized by struggle and suffering. Schopenhauer follows Buddhism in concluding that the only way to stop suffering is to stop desiring. Hence, he contends that

resignation and the asceticism that arises from it are the only alternative to a life of continuing suffering. Resignation is the outlook attained by the human being who fully grasps that the same Will is the inner reality within all phenomena. When one has fully incorporated this insight, one is no longer capable of competing or struggling with other phenomena. One achieves in this case the ideal that lies at the core of all religions—the ideal of compassion toward all other beings, in the full recognition that all are, in reality, one.

THE WORLD AS REPRESENTATION AND THE PRINCIPLE OF SUFFICIENT REASON

Let us now consider Schopenhauer's system in more detail. Schopenhauer begins *The World as Will and Representation* with a clear statement of his idealism." 'The world is my representation': this is a truth valid with reference to every living and knowing being, although man alone can bring it into reflective, abstract consciousness."[16] The existence of the world as it appears to us—the world as representation—is entirely contingent on consciousness.

True to his word, Schopenhauer begins his analysis of the world as representation by presupposing the account that he had given in *On the Fourfold Root of the Principle of Sufficient Reason.* Indeed, he asserts the world of representation is entirely governed by **the principle of sufficient reason,** a principle which he simply assumes. This principle, although variously formulated, essentially contends that there is a sufficient reason for every phenomenon. In one formulation Schopenhauer states that the principle holds that "every possible object… stands in a necessary relation to other objects, on the one hand as determined, on the other as determining."[17] The principle of sufficient reason establishes that all objects that are represented for the conscious mind stand in a nexus of connection with one another. Thus, every represented object can be entirely explained in terms of its relation to other objects.

In his dissertation Schopenhauer describes the different forms that the principle of sufficient reason takes in relating the four possible types of objects to their grounds. The four types of objects he analyzes are those of **being, becoming, knowing,** and **acting,** a list which he takes to be exhaustive of possible objects. By considering these sequentially, we can observe much about the structure of the Schopenhauerian world as representation.

As representation, the world is subject to the Kantian forms of intuition, **time and space.** These are forms essential to the constitution of

all objects by consciousness, and they individuate the world into particular, individual objects. For this reason, Schopenhauer sometimes refers to time and space as the *principium individuationis* (the principle of individuation). He also designates them "the ground of being" because of their fundamental role in securing the possibility of the world that we perceive. When Schopenhauer considers the principle of sufficient reason as it pertains to "being," he has time and space in mind.

The principle of sufficient reason pertains to our intuitions of time and space by establishing that positions within time and space exist in a nexus, mutually determining each other. In other words, the location of objects in time and space can be determined only in relation to other locations. Schopenhauer takes the existence of mathematics to reflect the lawlike interrelation of positions in the time-space continuum. Arithmetic focuses on relationships within time (for Schopenhauer sees it as originating in counting, which deals directly with succession in time). Geometry focuses on relationships within space. Geometric proofs depend on the principle of sufficient reason, for they draw on the fact that certain relationships imply others.

The representations of consciousness include both intuitive and abstract representations. Among the objects that are directly intuited are both objects of perception and the conditions of their possibility. These latter include time and space, and also causality. The **law of causality** is the form that the principle of sufficient reason takes in connection with perceptual objects, whose character Schopenhauer analyzes in terms of "becoming." Causes, for Schopenhauer, have to do with changes of states over time.

In order for change to occur within time, something must undergo the change. Schopenhauer considers the persisting object of change to be **matter.** He even defines matter as "the perceivability of time and space."[18] Matter and causality are conflatable, for "matter is absolutely nothing but causality…its being is its acting."[19] The "acting" that concerns Schopenhauer in this connection is the action of perceptual objects on our bodies. By means of these effects, we come to know causes. Causes provide the ground for given states of perceptual objects. Thus they are the form of connection that the principle of sufficient reason provides between representations of this type.

One might ask, at this juncture, how we come to know causes. Schopenhauer, like Kant, contends that perception is intellectual, for it essentially involves the **understanding** as well as sensation.[20] But Schopenhauer's conception of understanding differs from Kant's. Kant considers the understanding to be the faculty that applies principles of judgment to representations. Schopenhauer considers the understanding to be a faculty that leaps from a represented effect to its cause. At times Schopenhauer argues that apprehension of causality is the sole operation

of the understanding.[21] Schopenhauer attributes understanding to animals, as well as to human beings, maintaining that the "most sagacious animals" (e.g. dogs, monkeys, elephants, and foxes) give us an accurate picture of what the understanding can achieve without the assistance of reason.[22] Because causality is among the forms that constitute the world as representation, the world as representation exists only insofar as the understanding of at least one animal or human being is in operation.

Reason is the faculty, uniquely possessed by human beings, that enables them to form abstract representations, or concepts, the third possible object of consciousness that Schopenhauer considers. Concepts are "representations of representations." Thus, they are derived from perception. Many particulars (known through perception) can, at least in principle, be thought under a given concept, for concepts are essentially abstract and universal. Any concept can therefore be said to have a range. The faculty of **judgment** determines the relations among the ranges of various concepts.

"Knowing" is a matter of determining the truth of given judgments. The principle of sufficient reason ensures that every true judgment can be referred to a ground, and that truth can be established by this means. The particular form of the ground for a judgment depends on the type of judgment being made. Logical truths are grounded in other judgments; material truths are grounded empirically; transcendental truths are grounded in the conditions of the possibility of experience; and metalogical truths are grounded in the formal conditions of thought (the laws of identity, excluded middle, and contradiction, and the principle of sufficient reason).

Despite the fact that Schopenhauer credits judgment with the ability to interrelate concepts in a way that yields knowledge, he has little enthusiasm for the abstract articulation of such relationships in logic. "It is merely knowing in the abstract what everyone knows in the concrete."[23] Logic has no practical use, although Schopenhauer is willing to declare it "perfectly safe."[24] The only useful role of logic, according to Schopenhauer, is to assist philosophers in gaining insight into the nature of reason—and this should be their concern in their logical investigations.

The fourth type of object that Schopenhauer considers to be governed by the principle of sufficient reason, the object of "action," is the self as a willing being. In this case, the ground of action is a **motive.** Motives determine only the external results of willing—actions within the world as representation. The inner reality involved in willing will be discussed in connection with the world as Will.

In every case, the principle of sufficient reason pertains only to objects in the world as representation. It does not govern the thing-in-itself. Schopenhauer utilizes this distinction to dismiss a number of traditional

philosophical positions. Among these are all views regarding what Schopenhauer calls "the foolish controversy about the reality of the external world."[25] Because causality operates only within the phenomenal world, i.e. the world as representation, Schopenhauer argues, causality obtains only between objects, not between subject and object. The real object is always a representation of consciousness. Therefore, it is nonsense to seek (as do all who concern themselves with the problem of the external world's existence) a "real" object outside the phenomenal realm.[26]

Schopenhauer dismisses materialism on similar grounds. The materialist attempts to explain consciousness by reference to a prior material ground. But "matter" is, as we have seen, one of the forms fundamental to the thinking subject's capacity for representation. Without the thinking subject and the forms that it uses to constitute its representations, "matter" evaporates." 'No object without subject,' is the principle that renders all materialism for ever impossible."[27]

THE AMBIVALENCE OF REASON

Reason affords the human being unique possibilities, unavailable to animals. Through reason, human beings can transcend their own understanding. Unlike animals, who are motivated only by what they perceive directly, humans can be motivated by abstract ideas. They are also able to choose among motives because reason can represent several simultaneously. This transcendence enables the human being to have a sense of time, and to plan for the future. The use of words as tokens for concepts, an essential characteristic of rational beings, facilitates the formulation and preservation of knowledge, which in turn can be put to use in actualizing human plans.

Schopenhauer is less enthusiastic about reason, however, than most of his fellow philosophers. Reason introduces error, care, and doubt into human experience. By virtue of reason, human beings can lose touch with their perceptions and behave much more foolishly than animals can act. Along with consciousness of time, reason produces consciousness of death, and the dread that goes with it.

Schopenhauer considers reason's proper role in human experience to be relatively modest. Rational knowledge fixes "in concepts of reason what is known generally in another way."[28] Thus, reason does not, strictly speaking, yield knowledge; instead, it reproduces perceptual knowledge in an alternative form.

The value of reason's alternative mode of formulation is primarily that it enhances the communicability and preservation of knowledge. The

price, however, is a sacrifice of some of the fineness of perceptual knowledge, such as that which an expert billiard player or musician can employ in practice. The concepts of reason are also insufficient to produce art, which depends on the artist's perceptual acumen. Even in behavior, the concepts of reason are deceptively clear, lacking the finegrained character of perceptual knowledge.

Schopenhauer concludes that reason, while essential and useful in human life, must never gain the upper hand over perception. In this, he opposes not only the philosophical commonplace that reason is the pride of humanity. He also opposes the common ethical view that reason should be entrusted with control of one's behavior.

Reason is so far from being a trustworthy guide in behavior that Schopenhauer considers it to be an essential presupposition of folly. He analyzes the ludicrous, the ground of all humor, as arising from the incongruity of reason's concepts in relation to real objects. Behavioral foolishness, like other forms of humor, occurs when one interprets an object in terms of a single concept, but suddenly perceives that the object has one or more characteristics that are incompatible with that concept. Thus, to appropriate a joke from Kant's *Critique of Judgment,* the man who complained about the mourners at his loved one's funeral, on the grounds that they kept looking happier the more he paid them to look sad, makes a conceptual error. He interprets the mourners' expressions as being the services for which he pays them, and he ignores the fact that their expressions might literally "express" their pleasure at being paid.[29] Building on this analysis, Schopenhauer labels "foolish" those principled moralists who see reason as the appropriate ethical guide:

> Pedantry…arises from a man's having little confidence in his own understanding, and therefore not liking to leave things to its discretion, to recognize directly what is right in the particular case. Accordingly, he puts his understanding entirely under the guardianship of his reason, and makes use therefore on all occasion; in other words, he wants always to start from general concepts, rules, and maxims, and to stick strictly to these in life, in art, and even in ethical good conduct…. The incongruity between the concept and reality soon shows itself, as the former never descends to the particular case, and its universality and rigid definiteness can never accurately apply to reality's fine shades of difference and its innumerable modifications. Therefore the pedant with his general maxims almost always comes off badly in life, and shows himself foolish, absurd, and incompetent.

Even Kant, whom Schopenhauer largely admires, is convicted by this analysis:

> We cannot entirely exonerate Kant from the reproach of causing moral pedantry, in so far as he makes it a condition of the moral worth of an action that it be done from purely rational abstract maxims without any inclination or momentary emotion.[30]

Schopenhauer's insistence on the primacy of perception over reason extends to his analysis of science. Science aims at complete knowledge in the abstract of some particular species of objects. It is concerned with the form of knowledge, for it aims at facilitating and completing (i.e. systematically connecting and hierarchizing) what is known about its objects. Perception, however, being the ultimate source of knowledge, is also the basis of science. All scientific evidence derives ultimately from intuitive perception.

As a systematic employment of reason, science is subject to the limitations inherent to abstract thought. Frequently, science makes use of proofs, which involve the deduction of new consequences from previously accepted propositions. Proofs do not establish the certainty of their conclusions, for the truth of a conclusion depends on the truth of the premises. The conclusion of an abstract chain of reasoning, moreover, is never really new knowledge; it is only an exposition of what the premises already imply. "Proofs are generally less for those who want to learn than for those who want to dispute."

Schopenhauer is so thoroughly convinced that reason is subordinate to perception that he believes that every truth ascertained through proof or syllogism is, in principle, recognizable through direct perception as well.[31] He recommends a strategy of teaching geometric truths through direct observation of geometrical figures. This he prefers to Euclid's method of proof from axioms, "a very brilliant piece of perversity." Schopenhauer likens Euclid's approach to "a conjuring trick" that brings truth in "almost always…by the back door, since it follows *per accidens* from some minor circumstance."[32] Through direct perception we can see both *that* something is so and *why* it is so, according to Schopenhauer, while with Euclid's method, we see only the former.

Science, insofar as it aims to explain things, is concerned ultimately with the principle of sufficient reason. Explanation establishes the relations of phenomena with one another, a relation always determined by the principle of sufficient reason. In every case, however, the systematic pursuit of explanation stops, confronted either with the necessary truths fundamental to our basic forms of knowledge or with "an accepted *qualitas occulta* ('occult quality'), which is entirely obscure."[33] Primary concepts of science, such as weight, cohesion, and chemical properties, as well as the inner nature of a human being, are all *qualitates occultae*. Such occult qualities establish the limits of every science. Schopenhauer sees

these as indications of the thing-in-itself, which appears in them. The thing-in-itself is the inner reality that science cannot explain. It is thus the absolute limit that science cannot penetrate.

THE WILL AS THING-IN-ITSELF, THE INNER LIFE OF OBJECTS

Schopenhauer's account of the world as representation presupposes a third-person point of view. But what is the real significance of the world as representation? Schopenhauer observes, regarding the world's phenomena, that "these pictures or images do not march past us strange and meaningless…but speak to us directly, are understood, and acquire an interest that engrosses our whole nature."[34] Yet if we restrict our attention to what Schopenhauer considers in his account of the world as representation, our interest in these phenomena is mysterious. Our own position seems a bit like that of

> a man who, without knowing how, is brought into a company quite unknown to him, each member of which in turn presents to him another as his friend and cousin, and thus makes them sufficiently acquainted. The man himself, however, while assuring each person introduced of his pleasure at meeting him, always has on his lips the question: "But how the deuce do I stand to the whole company?"[35]

The key to resolving this question regarding our relationship to phenomena is the status of our own bodies. Each of us is not merely the consciousness for whom the world as representation exists. We are not only consciousness, but embodied. The body to which each consciousness is attached has an odd relationship to the world as representation. On the one hand, the body is itself a representation, which behaves much like other representations. On the other hand, the body seems to be moved by an inner mechanism. This inner mechanism, according to Schopenhauer, is aptly designated "will."

Schopenhauer takes sexual desire to be a paradigmatic manifestation of this inner will.[36] The will is demanding, persistent, discontented, and perpetually goal-oriented. Insofar as one has desires, one has will, according to Schopenhauer. The will connects us to the world as representation; it gives us "interests." We take an interest in our world because it provides objects, instruments, and obstructions in connection with our various desires and projects.

The individual's direct knowledge of his or her body has two aspects.

The individual experiences inner acts of will; yet these acts of will are simultaneously acts of the body. Schopenhauer concludes that the body is "nothing but the objectified will, i.e. will that has become representation." From the point of view of the world as representation, it is "the immediate object," but from the point of view afforded by one's inner awareness, it is "the objectivity of the will."[37]

Schopenhauer indicates several corollaries to his principle that the will and the body are one. First, willing and acting are one and the same. "Only the carrying out stamps the resolve; till then, it is always a mere intention that can be altered; it exists only in reason, in the abstract."[38] Second, pleasure and pain are not representations, but impressions of the will through the body. Such impressions are pleasure when they accord with the will, pain when they contradict the will. Third, every emotion, which Schopenhauer defines as a "vehement and excessive movement of the will," directly "agitates the body and its inner workings," thereby disturbing its vital functions.[39] Fourth, one cannot separate one's knowledge of the will from one's knowledge of the body and its individual acts in time. Thus, one cannot observe one's will as a whole, in its timeless reality.[40]

Schopenhauer considers the individual's direct knowledge of the will within the body to be knowledge of what the body is in itself. In this respect, our bodies afford access to the thing-in-itself, the realm that Kant denies to knowledge. Schopenhauer's approach here raises a conceptual problem. He accepts Kant's claim that the thing-in-itself does not admit of plurality. Yet in appealing to each individual's insight into the inner mechanism of his or her own body, Schopenhauer seems to have indicated an "inner reality" that still admits of plurality. He goes on to argue that the inner life that each individual recognizes in the body is a single life common to all. But how do we get from the plurality of inner "wills" to the unified thing-in-itself? Schopenhauer's statements regarding the relationship of particulars to the Will are not particularly illuminating: "only the will is thing-in-itself.... It is the innermost essence, the kernel, of every particular thing and also of the whole."[41]

Schopenhauer's argument for extending the concept of "will" to refer to the inner reality of all phenomena is similarly problematic. He defends this move by arguing that one has only two options. Either one can account for one's unique access to the inner life of one's own body by claiming that it is the *only* object that is both will and representation. This course would amount to solipsism, or theoretical egoism, the conviction that one's own being is the only real being. Or the individual can assume that all objects have a similar inner reality, and that while one's *relationship* to one's body is unique, the body itself is not. Serious theoretical egoism being a form of insanity, Schopenhauer dismisses the former alternative as a view that

requires "not so much a refutation as a cure."[42] He concludes that one is warranted in granting to every other phenomenal object a reality comparable to that of one's own body.

Thus, Schopenhauer exends the term "will," which seems apt for the inner life of our own bodies, to refer to the inner nature of all objects. Schopenhauer's primary defense of this extension is that we have no better alternative. He believes that we naturally tend to anthropomorphize our world because anthropomorphic metaphors convey the most to us. "Will," accordingly, conveys more to us than any other term we could use.

"Force" might be thought a viable alternative. But we have no insight into the basic forces of nature at all, Schopenhauer insists. They are *qualitates occultae,* completely unfathomable to us. By contrast, the word "will" refers to the most distinct form in which the reality underlying all phenomena appears to us. Thus, "will" is the most meaningful term we could use to name the inner reality of all things.

Schopenhauer considers the inner reality of other phenomena to be thoroughly comparable with our own. "Spinoza (*Epist*. 62) says that if a stone projected through the air had consciousness, it would imagine it was flying of its own will. I add merely that the stone would be right."[43] Schopenhauer points out, however, that in calling the inner nature of all objects, including inanimate ones, "Will," he does not mean to attribute sentience and conscious motives to all of them. Will operates differently in different types of objects. Only in humans and animals does it employ motives determined by knowledge. The stimuli that prompt most organic processes and the causes that occasion inorganic ones are mechanisms that do not involve knowledge. Nevertheless, despite the differences among these forms of causation, the Will is operative through all of them.

NO FREE WILL

Because he believes that motives determine the will in human beings, Schopenhauer denies that human beings have free will. An individual's actions are completely determined by motives in conjunction with his or her character. Schopenhauer follows Kant in distinguishing the **empirical character,** the character of the individual as it appears in phenomenon, from the **intelligible character,** the character as it is in itself, outside of time and space. Schopenhauer considers the latter to be a timeless, unalterable act of the Will, which is manifest in empirical behavior over time. The empirical character accurately objectifies the intelligible character: "the man…will always will in the particular what he wills on the whole."[44] But it does this gradually; and the precise forms through

which it manifests the intelligible character are in part determined by the entirely contingent features of circumstances.

Given that the empirical character, motives, and one's actions are all among the objects of representation, causality obtains among them. Hence, in principle, a causal account can be given to explain any of an individual's actions. However, in practice such accounts are limited. In the first place, human beings possess more striking individuality than do any other kind of beings. The range of human characters is considerable. Hence, one needs considerable knowledge of a particular person's character, in addition to knowledge of the motive, in order to predict what that person will do in a given case.

Moreover, the knowledge that one can have is knowledge of the empirical character, which is not the character of the individual in itself, but only the appearance of the latter over time. In the case of those whom we have known well for a long time, we may be fairly competent predictors of behavior. But we come to know the empirical character only through its actions, after the fact; thus, our knowledge is limited. This is as true of one's own character as of any other individual's. Knowledge even of one's own character is a considerable achievement. Schopenhauer labels such gradually accumulated knowledge of what one wills and what one can do **"acquired character."** Such knowledge enables one to direct one's actions consistently and effectively toward satisfaction of one's will, for it allows one to recognize in advance what courses of action are worth attempting, given one's own limitations.

Our ignorance, even of our own characters, leads many to believe that human beings have free will. Because we lack sufficient information to predict our own and others' behavior accurately, we cannot see that it follows absolutely from the interaction of character and motive. Moreover, because we engage in deliberation, the abstract contemplation of multiple motives, each of which recommends a different course of action, we tend to feel as though the ensuing action is in suspension until we choose. "But," claims Schopenhauer,

> this is just the same as if we were to say in the case of a vertical pole, thrown off its balance and hesitating which way to fall, that "it can topple over to the right or to the left"…this *"can"* has only a subjective significance, and really means "in view of the data known to us." For objectively, the direction of the fall is necessarily determined as soon as the hesitation takes place. Accordingly, the decision of one's own will is undetermined only for its spectator, one's own intellect, and therefore only relatively and subjectively…. In itself and objectively, on the other hand, the decision is at once determined and necessary in the case of every choice presented to it.[45]

The true situation is reflected by our own attitudes regarding freedom. Schopenhauer observes that

> everyone considers himself to be *a priori* quite free, even in his individual actions, and imagines he can at any moment enter upon a different way of life, which is equivalent to saying that he can become a different person. But *a posteriori* through experience, he finds to his astonishment that he is not free, but liable to necessity; that notwithstanding all his resolutions and reflections he does not change his conduct, and that from the beginning to the end of his life he must bear the same character that he himself condemns, and, as it were, must play to the end the part he has taken upon himself.[46]

The explanation lies in the fact that as individuals our actions are completely determined by our characters and a motive. However, because our own inner reality is the Will, which is not constrained by causality, we feel the Will's freedom within ourselves and mistakenly associate it with our own individuality. What the Will freely does, however, is to assign to each of us a character, which we have no power to alter. We are also incapable of explaining why an individual has the particular character he or she does, for the Will is not subject to causality, and thus is not constrained by anything in its selection of this character.

Thus, no explanation can be provided as to why an individual is motivated by the particular motive he or she is. Our account of human behavior is necessarily limited. In this respect, human behavior is akin to the behavior of everything else in the phenomenal world. All rests on *qualitates occultae* which cannot be further illuminated.

PLATONIC IDEAS

We have already observed that Schopenhauer's account of the unity of the thing-in-itself does not square easily with the plural points of departure we are told to use to infer it. Schopenhauer touches on the problem of bridging the noumenal and phenomenal realms in his appeal to the Platonic theory of the Forms, or "Platonic Ideas."

Schopenhauer attempts to clarify the Will's relationship to its plural manifestations by arguing that it does not make sense to say that "more" will is in the human being than in the stone. "More" and "less" depend on the spatial form in which the representation appears and have to do only with the will's objectification, not with the Will itself. The inner life of each thing is "present whole and undivided" within it.[47] However, it is

appropriate to say that the Will is objectified to a higher degree in the human being than in the stone. The Platonic Ideas are the immediate objectivity of the Will at particular grades, or degrees.

The Platonic Ideas are for Schopenhauer, as for Plato, the unchanging eternal patterns, or Forms, in which the innumerable, transient particulars of the phenomenal world participate. Every particular Idea, in Schopenhauer's usage, is a definite "grade of the will's objectification…related to individual things as their eternal forms, or as their prototypes."[48] These are, according to Schopenhauer, intuitively graspable by perception, not mediated by the abstractions of reason.

The "location" of the Platonic Ideas in relation to the noumenal and phenomenal worlds (i.e. the world as Will and the world as representation) is a bit confusing. The Platonic Ideas are outside time and space, and hence not in the world as representation. On the other hand, they are multiple, while the Will is not. Perhaps the best way to understand the Ideas' "bridging" of the world as Will and the world as representation is to envision the Ideas as windows through which the Will has access to the world as representation. Of course, the world as representation is entirely a manifestation of the Will, according to Schopenhauer. Thus, the window image is misleading, in that it makes the world as Will and the world as representation seem more distinct than they are in Schopenhauer's scheme.

Although the Platonic Ideas and the thing-in-itself are not identical, Schopenhauer considers them "very closely related," being two "paths leading to one goal."[49] He concludes that the most paradoxical concepts in the thought of Plato and Kant—the Forms and the thing-in-itself—are thus reflections of essentially the same insight:

> the inner meaning of both doctrines is wholly the same; that both declare the visible world to be a phenomenon which in itself is void and empty, and which has meaning and borrowed reality only through the thing that expresses itself in it (the thing-in-itself in the one case, the Idea in the other).[50]

The unity of the Platonic Idea in all its phenomena is, according to Schopenhauer, what is meant by "a law of nature." Laws of nature relate the Idea to the forms of representation. Because both the Idea and the conditions of its representability are constant, a law of nature holds for all the phenomena it governs, without exception. What acts in any such case is an inexplicable natural force. The "cause" involved determines only when and where a particular natural force has the occasion to exhibit itself in a particular piece of matter.

The Platonic Ideas, according to Schopenhauer, comprise a hierarchy of

discrete levels. The "lowest" grades of the Will's objedification are the universal forces of nature. Among these are gravity and impenetrability, which govern all matter. Schopenhauer also includes "rigidity, fluidity, elasticity, electricity, magnetism, chemical properties, and qualities of every kind," forces that govern some pieces of matter but not others.[51]

Individuality is a function of the hierarchy of the Platonic Ideas, such that the higher grades of the Will's objectification exhibit more individuality than the lower ones. Accordingly, higher animals have more individuality than lower ones. In the lower animals, one sees no trace of individuality, but only the general character and physiognomy of the species. Plants have little individual character, according to Schopenhauer, while inorganic objects have virtually none.

Human beings have more individuality than anything else in nature. Individuality is so extreme in human beings that every person can "to a certain extent" be described in terms of a particular idea. Schopenhauer identifies this "Idea" of the individual as the individual's intelligible character, the result of a unique act of the Will outside time. Nonetheless, Schopenhauer insists that human beings manifest a common form of humanity. Perhaps the best way of integrating these two claims is to see the "special" Ideas of each individual human to be facets of the more encompassing Idea of humanity. Indeed, Schopenhauer indicates that individuality in general amounts to partial expression of "the whole of the Idea."[52]

Because the same Will manifests itself in all Ideas, all phenomena manifesting the Ideas have an inner relationship with one another. One consequence is that the forms of the various plants and animals all bear a kind of analogy with one another. A family likeness prevails even between the Ideas of inorganic phenomena. Schopenhauer points to the analogies that can be observed between electricity and magnetism, and between chemical attraction and gravitation.

The levels of the Will's manifestation are also mutually dependent upon one another. The Ideas form a pyramid, with the Idea of humanity as its culmination. The manifestations of the higher Ideas, accordingly, presuppose the manifestations of the lower in external nature. Hence, the human being depends on animals; animals depend on other animals and plants; the plants need soil, water, sun, etc.; and all of nature depends on the inert mass of the planet. Every phenomenon adapts itself to its environment, while its environment similarly adapts itself to each phenomenon. This interdependence of all phenomena in nature reflects the fact that "the will must live in itself, since nothing exists besides it, and it is a hungry will."[53]

Despite such analogies, however, Schopenhauer insists that the Ideas should not be conflated with one another. Indeed, phenomena of different

Ideas can be seen as essentially at war with one another. Throughout the organic world, one organism eats or somehow assimilates another: "every animal can maintain its own existence only by the incessant elimination of another's."[54] The struggle among the various kinds of phenomenon assimilated in the organic body exemplifies a more basic struggle, that inherent to the nature of the Will. The Will, as Schopenhauer conceives it, is fundamentally at "variance with itself."[55] Even matter exists by virtue of a struggle among forces of attraction and repulsion, manifested as gravitation and impenetrability. Although the unity and oneness of the Will are manifest in the mutual adaptation of all natural phenomena, the harmony goes only so far as is necessary for "the continuance of the world,"[56] which requires only the continuance of species, not that of particular individuals.

The essential struggle among all phenomena corresponds to the fact that the Will operating within them is blind. Even in beings that have knowledge, knowledge is originally and fundamentally an expedient of the will. Only rarely, in aesthetic experience and ethical insight, does human knowledge do anything but assist the fulfillment of the will's demands. Thus, humans, too, with rare exceptions, struggle endlessly with other phenomena.

Although the Will struggles continually, we are not in a position to say why the Will wills. Even to ask the question is to confuse the Will with the phenomenon, for it amounts to asking what causes the Will's willing. Nothing can cause the Will's willing, for the Will is not determined by causality, which is only a form of the Will's objectification in the world as representation. As thing-in-itself, the Will is groundless. Schopenhauer concludes that the Will is aimless, and that aimless, endless striving is also characteristic of its manifestations.

AESTHETIC EXPERIENCE

Aesthetic experience provides, for most individuals, the sole respite from "the penal servitude of willing."[57] According to Schopenhauer, aesthetic experience involves direct knowledge of the Platonic Ideas. Because these Ideas are not subject to the principle of sufficient reason, they are not objects of knowledge in the phenomenal world. The individual is manifest as an individual only within the phenomenal world, however. Schopenhauer concludes that the Ideas can only become objects of knowledge "by abolishing individuality in the knowing subject."[58] This is what aesthetic experience accomplishes.

Schopenhauer describes aesthetic experience by means of a contrast

with everyday experience. In everyday experience, the individual experiences his or her body as existing in a world of other objects that stand in various relations to it, and by means of it, to the individual's will. The other objects of the phenomenal world are conceived by the individual as either potential means or potential obstacles to the fulfillment of the will's desires. These objects are known, in fact, only in terms of their relations to other manifestations of the will—for accounts in terms of the principle of sufficient reason are essentially relational accounts.

Aesthetic experience alters the individual's perception of objects and the individual's awareness of self. The individual ceases to be "merely individual" and becomes "a pure will-less subject of knowledge."[59] In aesthetic experience, the subject is no longer concerned with relations between his or her body and other objects, but instead restfully contemplates the object alone, outside of all relations. This contemplation is not mediated by abstract concepts; instead, one devotes one's mind entirely to perception of what is present. The distinction of subject and object drops away in this state of absorption; one does not differentiate the perceiver from the perception. In aesthetic experience, we are appropriately said to "lose ourselves."[60]

The "knowledge" involved in aesthetic experience does not involve knowledge of an object's relations. What is known, instead, is the Idea of the object. The object is rendered universal in this experience, for it becomes, for the perceiver, the eternal form of the will's objectivity at its grade. The subject, at the same time, also becomes universal as the "*pure* will-less, painless, timeless subject of knowledge."[61] Both subject and object have passed beyond the forms of the principle of sufficient reason. The timeless Idea that is the object's prototype becomes present to the observer as a timeless intellect, no longer engaged in projects of the will.

In arguing that aesthetic experience undermines desire, Schopenhauer accepts Kant's claim that aesthetic experience is essentially disinterested. Nietzsche indicates the controversial nature of this claim in his caricature of Schopenhauer's aesthetics:

> Schopenhauer speaks of *beauty* with a melancholy fervor.... Beauty is for him a momentary redemption from the "will"—a lure to eternal redemption. Particularly, he praises beauty as the redeemer from "the focal point of the will," from sexuality—in beauty he sees the negation of the drive toward procreation. Queer saint! Somebody seems to be contradicting you; I fear it is nature.[62]

Nietzsche rejects Kant and Schopenhauer's characterization of beauty as

inspiring contemplation that is "disinterested," arguing that nothing is of greater interest to human beings.

Although Schopenhauer follows Kant in his analysis of aesthetic disinterestedness, he breaks from Kant in his analysis of the difference between **the beautiful** and **the sublime**. According to Kant, appreciation of the beautiful and appreciation of the sublime involve different mental operations and even different faculties. Schopenhauer, by contrast, insists that the beautiful and the sublime differ rather slightly. Both aim, in his view, at contemplation of the Idea within phenomena.

The difference between the beautiful and the sublime lies only in the contemplated object's usual relationship to the will. In the case of the beautiful, the object contemplated seems almost designed for willless contemplation; its form is so well suited to the human senses that it invites tranquil observation. In the case of the sublime, however, the contemplated object has, by its very nature, a hostile relationship to the observer's will, and the observer is consequently aware of some inner aversion to it. One can achieve aesthetic contemplation of the sublime, therefore, only by means of forcibly subduing the will's aversion. In the case of the beautiful, on the other hand, the object itself soothes the will, and no effort is required to silence it.

Schopenhauer concludes that the beautiful and the sublime are two ends of the same continuum. Besides paradigm cases of each, certain cases fall in between. These Schopenhauer considers relatively sublime. For example, even the aesthetic appreciation of radiant sunlight on a snowy landscape is somewhat sublime; one must forcibly resist dwelling upon the inhospitable temperature of the snow in order to enjoy the visual spectacle.

Like experience of the beautiful and of the sublime, in Schopenhauer's analysis, aesthetic experiences of nature and art are essentially kindred. **Art** is "the work of **genius**."[63] Genius is a pre-eminent talent for engaging in aesthetic contemplation. The genius is able to "grasp the Idea of each thing, not its relation to other things."[64] Because this process involves forgetting one's own personal concerns, Schopenhauer describes genius as "the most complete objectivity, i.e. the objective tendency of the mind."[65]

The genius's talent is possessed in some measure by all human beings. According to Schopenhauer, this is why the average individual is able to enjoy art. In art the genius communicates his or her own recognition of Ideas. Aesthetic pleasure is always a matter of grasping the Idea, whether the phenomenon contemplated is a natural object or an artwork. For most individuals, however, "the Idea comes…more easily from the work of art." This is because "the artist, who knew only the Idea and not reality, clearly repeated in his work only the Idea, separated it out from reality, and omitted all disturbing contingencies."[66]

Through this analysis of the artwork, Schopenhauer suggests criteria for evaluating art. Good art is produced when the artist works from direct perception of the Idea, not from conceptual recipes. The success of an artwork also depends on the artist's technical skill at communicating this direct perception to the audience.

Like many aestheticians of his own and the previous century, Schopenhauer hierarchically classifies the types of an. His criterion for classification is the significance of the Platonic Ideas that are focal within a given medium. Thus, the arts that invite contemplation of the lower Ideas are ranked lower than those that invite contemplation of the higher Ideas.

Architecture is assigned the lowest place in Schopenhauer's hierarchy, because it brings "to clearer perceptiveness some of those Ideas that are the lowest grades of the will's objectivity." Among these, he includes "gravity, cohesion, rigidity, hardness," and also "light, which is in many respects their opposite."[67] Architecture reveals the way in which these basic forces oppose one another. Thus, rigidity opposes gravity in certain constructions. Schopenhauer classifies "artistic arrangements of water" on the same level as architecture, for fountains bring into prominence the Ideas of fluidity and gravity, again Ideas at the lowest grades of the Will's objectivity.

Landscape gardening and landscape painting comprise the level above architecture and fountain art in Schopenhauer's scheme, for these reveal the Ideas of the vegetative world. The next level includes animal painting and animal sculpture, which reveal the Ideas of animal life. Historical painting and sculpture reveal the Idea of the human being, and hence these occupy a still higher level. But a fuller revelation of the Idea of the human being occurs in poetry, where the principal object is the human being "in so far as he expresses himself not through the mere form and expression of his features and countenance, but through a chain of actions and of the accompanying thought and emotions."[68]

Schopenhauer believes that the most profound insight into humanity involves awareness that the same Will wars against itself in the conflicts among human beings. Presumably, this is why he classifies tragedy as "the summit of poetic art." Tragedy aims at "the description of the terrible side of life," and it reveals the profound insight "that what the hero atones for is not his own particular sins, but original sin, in other words, the guilt of existence itself."[69] Optimally, tragedy can bring home to its audience the true character of our interactions with one another. In the best type of tragedy,

> characters as they usually are in a moral regard in circumstances that frequently occur, are so situated with regard to one another that their position forces them, knowingly and with their eyes open, to do one

> another the greatest injury, without any one of them being entirely in the wrong.[70]

Thus far, no mention has been made of music. Schopenhauer sees music as being entirely unlike the other arts. All other arts aim to facilitate perception of the Ideas, on his account; but music copies the Will directly. As a consequence, "the effect of music is so very much more powerful and penetrating than is that of the other arts."[71] Not at all concerned to represent specific phenomena, as do the visual arts, music transcends particularity even in emotional expression:

> Therefore music does not express this or that particular and definite pleasure, this or that affliction, pain, sorrow, horror, gaiety, merriment, or peace of mind, but joy, pain, sorrow, horror, gaiety, merriment, peace of mind *themselves,* to a certain extent in the abstract, their essential nature, without any accessories, and so also without the motives for them.[72]

Because the world as representation itself, taken as a whole, is an objectification of the Will, music and the world have a parallel relationship to the Will. Thus, Schopenhauer concludes that a complete philosophy of music would "also be at once a sufficient repetition and explanation of the world in concepts, or one wholly corresponding thereto, and hence, the true philosophy."[73]

Schopenhauer elaborates on this suggestion by indicating points of analogy between features of music and characteristics of the world. These depend, to a certain extent, on the structure of the music with which Schopenhauer was contingently familiar. Thus, he compares the relatively hierarchical relationships among voices common in Western music of the eighteenth and nineteenth centuries to the hierarchical relationships among Ideas. The low voices, like the lowest Ideas, provide the ground on which all the others depend. Schopenhauer compares the melody to "the intellectual life and endeavor of man," for unlike the inner voices in his analogy (which he compares to animal and vegetable life), "*melody* alone has significant and intentional connexion from beginning to end."[74]

Despite Schopenhauer's analysis of music as a copy of the Will, he believes that music, like the other arts, affords escape from everyday awareness, which is constantly driven by will. This is because music expresses the nature of willing in universal form, without concern for particular phenomena. In this respect, the insight that music affords resembles that which Schopenhauer sees essential to ethics, the insight that the phenomenal world, with its apparently separate objects and individuals, is an illusion that veils the transcendent nature of the world.

LIFE IS SUFFERING

Because all individuals, and indeed all living phenomena, are objectifications of the Will, their essential tendency is to will. Striving continually, living beings gain one objective only to strive anew for another. Dissatisfaction of one sort or another characterizes life from beginning to end. The life of all humans and animals "swings like a pendulum to and fro between pain and boredom, and these two are in fact its ultimate constituents."[75]

Analyzing all striving as essentially "need, lack, and hence pain," Schopenhauer concludes that life is essentially suffering:

> The life of the great majority is only a constant struggle for this same existence, with the certainty of ultimately losing it. What enables them to endure this wearisome battle is not so much the love of life as the fear of death.[76]

Schopenhauer contends that fear of death is irrational. Only the human being as phenomenon is transient; as thing-in-itself the human being is eternal. Nevertheless, this is rarely consoling to the individual, who most often takes individual existence (understood through the forms of the world as representation) extremely seriously. Thus, the life of the individual human being is for the most part perverse and pointless:

> The life of every individual, viewed as a whole and in general, and when only its most significant features are emphasized, is really a tragedy; but gone through in detail it has the character of a comedy. For the doings and worries of the day, the restless mockeries of the moment, the desires and fears of the week, the mishaps of every hour, are all brought about by chance that is always bent on some mischievous trick; they are nothing but scenes from a comedy. The never-fulfilled wishes, the frustrated mistakes of the whole life, with increasing suffering and death at the end, always give us a tragedy. Thus, as if fate wished to add mockery to the misery of our existence, our life must contain all the woes of tragedy, and yet we cannot even assert the dignity of tragic characters, but, in the broad detail of life, are inevitably the foolish characters of a comedy.[77]

Sexuality, which most pointedly displays the Will in human beings, exemplifies this connection between desire and suffering. The Will deludes the individual into imagining that gaining the beloved will result in happiness. In fact, however, the Will is only concerned with the

preservation of the species, not with the happiness of the individual. Thus, while human sexual desire is extremely individualized, it is motivated only by the Will's concern that the species propagate a new generation of healthy children with relatively standard traits.[78] Schopenhauer concludes that the embarrassment surrounding sexuality stems from guilt at renewing the world's suffering by contributing to a new generation.

> If…we…contemplate the bustle and turmoil of life, we see everyone concerned with its cares and troubles, exerting all his strength to satisfy infinite needs and to ward off suffering in many forms, yet without daring to hope for anything else in place of it except just the preservation of this tormented existence for a short span of time. In between, however, we see in the midst of the tumult the glances of two lovers meet longingly; yet why so secretly, nervously, and furtively? Because these lovers are the traitors who secretly strive to perpetuate the whole trouble and toil that would otherwise rapidly come to an end. Such an end they try to frustrate, as others like them have frustrated it previously.[79]

SALVATION AND MORAL GOODNESS

The affirmation of the Will-to-live, which is fundamental to all living beings, necessarily results in a life of suffering. The only salvation from suffering, according to Schopenhauer, is the denial of the Will-to-live. This is possible only for human beings, for human beings alone are capable of inner knowledge into the reality behind phenomenon. In rare individuals this knowledge becomes so completely absorbed that particular phenomena come to seem merely illusory. In such a case, these phenomena no longer provide motives for the will. When this happens, the will is quieted, "and thus the will freely abolishes itself."[80] The suffering Will itself, in such an individual, attains peace. The saintly individual, therefore, fulfills the ultimate aim of the Will (the cessation of struggle), but precisely by denying the will within.

Although Schopenhauer's formulations of such ascetic salvation sound negative, the insight motivating the holy life is essentially the same insight that motivates all virtuous behavior. The basic knowledge fundamental to both is the knowledge that the Will driving all phenomena is essentially one.

When one perceives this truth, one is no longer motivated to do **wrong,** which Schopenhauer describes as being the denial of the will in another

individual. Egoism, the source of all wrongdoing, arises from the delusion that one's individual, phenomenal existence is tremendously important. Perception of the truth—that the same will is manifest in all beings—dispells this delusion.

Such perception, however, admits of degrees. Even the **bad** person, who is so little in control of the will within that he or she chooses to violate the will in other individuals, has a pained awareness that such action is wrong. This is because every individual dimly grasps that such action violates one's own true being. The person who recognizes the Will's oneness to a somewhat greater degree is **just**. Such a person refrains from affirming his or her own will at the expense of any other individual's right to a similar affirmation.

Moral goodness, in Schopenhauer's analysis, stems directly from knowledge and its quieting effect on the will. Schopenhauer denies that universal moral principles have any value, for virtue is achieved individually by means of insight. One might wonder how beings without free will can achieve moral transformation by means of insight. Schopenhauer's answer is that while motive and character together determine action, change of knowledge produces a change of motive, which in turn affects the action that results. All **repentance** arises from a change of knowledge, not from a change of will. When one recognizes that one has used an inappropriate means for obtaining one's object, for instance, this knowledge results in a change of behavior. In the case of radical transformation toward virtue, Schopenhauer would argue that one has recognized that no action directed against another's will could possibly enhance one's life. Hence, any such action is no longer seen as a viable means to achieve one's ends, so one comes to avoid such actions.

The **good** person goes further than the just person and is moved to **compassion** for all sentient beings by the recognition that they are all phenomena of the same will. A truly noble person "makes less distinction than is usually made between himself and others," and thus displays concern for others of the same degree as that concern directed toward the self.[81] Such individuals have penetrated the *principium individuationis,* which creates the illusion of individual separateness.

The ultimate penetration of the *principium individuationis* is achieved by the saint. A saint has seen through the delusions of the phenomenal world and responded with so much compassion that he or she no longer wants to have any part in inflicting suffering. This self-abolition of the will is the course taken by mystics of all traditions, according to Schopenhauer. No longer motivated by phenomena, these holy individuals abandon the usual expressions of will in human life. Thus, they abstain from sex, adopt voluntary poverty, fast, and in general mortify the body, which is objectified affirmation of the Will. Their

entire existence is characterized by **renunciation of the will,** and their lives are models of **resignation**.

True salvation stems from this complete denial of the will.[82] At its extreme point, the result is the extinction of character, for no motive still stimulates willful action on the part of the saint. The saint's will evaporates. But in addition, with the evaporation of the will, the entire world as representation, with its inherent distinctions among objects and individuals, vanishes. What remains is "empty *nothingness*" which the Buddhists have labeled *nirvana*.[83]

This nothingness is not, however, absolute. Indeed, the saints and mystics of the ages have described their state as full and blissful. Schopenhauer observes that we conceive of their condition as nothing only because our world of suffering and struggle complete absorbs us:

> we have to banish the dark impression of that nothingness, which as the final goal hovers behind all virtue and holiness, and which we fear as children fear darkness.... On the contrary, we freely acknowledge that what remains after the complete abolition of the will is, for all who are still full of the will, assuredly nothing. But also conversely, to those in whom the will has turned and denied itself, this very real world of ours with all its suns and galaxies is—nothing.[84]

SCHOPENHAUER'S INTELLECTUAL LEGACY

Schopenhauer did not really expect his theory of resignation and denial of the will to inspire enthusiasts. Indeed, he prided himself on his renunciation of popularity with his contemporaries.[85] Nevertheless, Schopenhauer would presumably be gratified by the extent to which his ideas have assumed prominence.

Most strikingly, Schopenhauer's conviction that knowledge is subordinate to will—as well as his suggestive remarks on the unconscious—have taken root in contemporary psychological theory. In these respects, as well as in his focus on the body as a philosophical starting point, he reverses Cartesianism and influences much twentieth-century thought. Schopenhauer is also pioneering in developing a systematic philosophy that is completely disconcerned with theology. His pessimistic theories offer a critical response to German romanticism within its own century. Schopenhauer is also closer to the following century in

valuing and engaging in comparative studies of the philosophical traditions of the East and the West. Finally, although the ethical claims that he would endorse are relatively traditional, Schopenhauer's denial of the efficacy of moral maxims and universal principles precurses later radical critiques of morality in general.

Ironically, given his doctrine of renunciation of the will, Schopenhauer's writings reveal an insatiable zest for life. Impatient with virtually all of his contemporaries, Schopenhauer seems nevertheless to delight in description and to take pains to move others through his prose. Perhaps his clarity of insight into phenomena is Schopenhauer's greatest philosophical legacy. Schopenhauer lends us his own perceptions of the world. Fittingly, in one who elevates perception over reason, Schopenhauer's perceptions continue to provoke and inspire many who reject every detail of his philosophical system. Although his system is "ingeniously elaborated,"[86] his perceptions are brilliant.

7 The German word *"Wille,"* like all German nouns, is consistently capitalized. Payne, in his translations of Schopenhauer, consistently translates this term as "will," with the "w" in lower-case type. I shall adopt the convention of using "Will" to refer to Schopenhauer's metaphysical principle and "will" to refer to the individual will in my own discussion. In citations from Payne's translations, however, I shall follow his usage.
8 F.Nietzsche, *The Genealogy of Morals,* in *The Complete Works of Friedrich Nietzsche,* ed. O.Levy, Vol. 13, trans. H.B.Samuel (Edinburgh: T.N.Foulis, 1910), p. 132.

11 See Schopenhauer, "On Women," in *Parerga and Paralipomena: Short Philosophical Essays,* 2 vols, trans. E.F.J.Payne, Vol. II (Oxford: Clarendon Press, 1974), hereafter referred to as *PP,* pp. 614–26. There, after insisting that

women have no talent for the arts, Schopenhauer compares contemporary "ladies" to "the sacred apes at Benares who, conscious of their sanctity and invulnerability, think that they are at liberty to do anything and everything" (p. 622). He also contends that unlike men, who feel rivalry only for other members of their profession, women feel hostility for all other women. The explanation he offers for this alleged phenomenon is that "with women" professional jealousy "embraces the whole sex since they all have only one line of business" (p. 619). Copleston observes that Schopenhauer's experience of women other than his mother was also "of a character hardly calculated to generate a real respect for and appreciation of the other sex." See F.Copleston SJ, *Arthur Schopenhauer: Philosopher of Pessimism,* Bellarmine Series, XI, ed. E.F.Sutcliffe SJ (London: Burns, Oates & Washbourne, 1947), pp. 39–40.

12 *WWR,* I, p. xxii.

13 This is reflected by his choosing to open his Appendix to *WWR,* I, entided "Criticism of the Kantian Philosophy," with Voltaire's comment: "It is the privilege of true genius, and especially of the genius who opens up a new path, to make great mistakes with impunity" (p. 413). This sentiment contrasts markedly with Schopenhauer's assessments of virtually every other philosopher in the Western tradition, with the exception of Plato. Consider, for example, his remarks on Aristotle in "Fragments for the History of Philosophy": "The fundamental characteristic of Aristotle might be said to be the greatest shrewdness and sagacity combined with circumspection, power of observation, versatility, and want of depth. His view of the world is shallow, although ingeniously elaborated." *PP,* I, p. 47.

14 P.Gardiner, *Schopenhauer* (Harmondsworth: Penguin, 1963), p. 21.

15 Julian Young has recently taken issue with the standard reading of Schopenhauer, which interprets the Will as the thing-in-itself. According to Young, the Will is another aspect of the thing-in-itself's appearance, but not the thing-in-itself. See J.Young, *Willing and Unwilling: A Study in the Philosophy of Arthur Schopenhauer* (Dordrecht: Nijhoff, 1987), pp. ix, 32ff.

16 *WWR,* I, p. 3.

17 Ibid., p. 6.

18 Ibid., p. 8.

19 Ibid., p. 8.

20 Kant also claims that perception involves imagination as well as understanding. Schopenhauer focuses exclusively on understanding when he considers the role of the intellect in perception.

21 See *WWR,* I, p. n. For an analysis of the many additional operations that Schopenhauer implicitly assigns to the understanding, as well as a comparison of Schopenhauer's analysis of perception with Kant's, see D.W.Hamlyn, *Schopenhauer,* Arguments of the Philosophers Series, ed. T.Honderich (London: Routledge & Kegan Paul, 1980), pp. 18–22.

22 *WWR,* I, p. 23.

23 Ibid., p. 45.

24 Ibid., p. 46.

25 Ibid., p. 13.

26 Schopenhauer does, as we shall see, believe that a thing-in-itself exists over and above representation. But the thing-in-itself, independent of the principle of sufficient reason, does not admit of duality. Hence, we cannot construe the

thing-in-itself to be the realm of "real" objects that are only represented in the phenomenal world.

78 Schopenhauer elaborates a theory of sexual attraction based on the principle that opposites attract. Opposites attract, according to Schopenhauer, because the Will aims to produce children that correspond more or less to the Idea of humanity. Thus, it tries to prevent individuals who are too similar from mating, lest they reproduce offspring who are too extreme in certain characteristics. See "The Metaphysics of Sexual Love," *WWR,* II, pp. 531–60.
79 *WWR,* II, p. 560.
80 *WWR,* I, p. 285.
81 Ibid., p. 372.
82 Schopenhauer sharply distinguishes denial of the will from suicide. Suicide, in his view, is an extreme expression of affirmation of the will and no salvation at all. See *WWR,* I, pp. 366, 398–9. See also Schopenhauer, "On Suicide," *PP,* II, pp. 306–11.
83 Schopenhauer's assessments that life is suffering, and that only an end to desire would put an end to suffering, are directly taken from Buddhist thought. For some of Schopenhauer's remarks on Buddhism, see *WWR,* I, p. 356, and II, pp. 169, 463, 508, 607f.

CHAPTER 11

Kierkegaard's speculative despair

Judith Butler

> Every movement of infinity is carried out through passion, and no reflection can produce a movement. This is the continual leap in existence that explains the movement, whereas mediation is a chimera, which in Hegel is supposed to explain everything and which is also the only thing he never has tried to explain.
>
> (Kierkegaard, *Fear and Trembling,* p. 42)

Kierkegaard's critique of Hegel concerns primarily the failure of a philosophy of reflection to take account of that which exceeds reflection itself: passion, existence, faith. The irony in Kierkegaard's challenge to Hegelianism is, however, minimally twofold. On the one hand, Kierkegaard will ask, where is it that Hegel, the existing individual, stands in relation to the systematic totality that Hegel elucidates? If Hegel the individual is outside the complete system, then there is an "outside" to that system, which is to say that the system is not as exhaustively descriptive and explanatory as it claims to be. Paradoxically, the very existence of Hegel, the existing philosopher, effectively—one might say *rhetorically*—undermines what appears to be the most important claim in that philosophy, the claim to provide a comprehensive account of knowledge and reality. On the other hand, Kierkegaard's counter to Hegel consists in the valorization of passion and existence over reflection and, finally, language. It is in relation to this criticism that a different sort of irony emerges, one which Kierkegaard appears not to know, but which attends his various claims to be writing on behalf of that which is beyond

speculation, reflection, and language. If Kierkegaard is right that Hegel omits the existing individual from his system, that does not mean that Kierkegaard maintains an unsystematic or nonspeculative view of the existing individual. Although Kierkegaard sometimes uses the speculative terminology of Hegelianism, he appears to parody that discourse in order to reveal its constitutive contradictions. And yet, in Kierkegaard's descriptions of despair in *Sickness unto Death* (1849), his use of Hegelian language works not only to displace the authority of Hegel, but also to make use of Hegelianism for an anlaysis that both extends and exceeds the properly Hegelian purview. In this sense, Kierkegaard *opposes* himself to Hegel, but this is a vital opposition, a determining opposition, one might almost say 'an Hegelian opposition,' even if it is one that Hegel himself could not have fully anticipated. If Hegel's individual is implicated in the very existence that he seeks to overcome through rationality, Kierkegaard constructs his notion of the individual at the very limits of the speculative discourse that he seeks to oppose. This appears to be one ironic way, then, that Kierkegaard's own philosophical exercise is implicated in the tradition of German Idealism.

DESPAIR AND THE FAILURE TO ACHIEVE IDENTITY

In the following, I will try to make clear why *despair* is a category or, in Kierkegaard's terms, a sickness and a passion, whose analysis is crucial to both the extension and critique of Hegel in Kierkegaard's work. Insofar as despair characterizes the failure of a self fully to know or to become itself, a failure to become self-identical, an interrupted relation, then despair is precisely that which thwarts the possibility of a fully mediated subject in Hegel's sense. That subject is documented in Hegel's *Phenomenology of Spirit* as an emerging set of syntheses, the subject as one who mediates and, hence, overcomes that which initially appears as *different from itself*. The success of this mediating activity confirms the capacity of the subject to achieve self-identity, that is, to know itself, to become at home in otherness, to discover that in a less than obvious and simple way it *is* that which it incessantly encounters as outside of itself.

Hegel narrates in *The Phenomenology of Spirit* the various ways in which this mediating relation can fail, but insofar as Hegel claims that subject is substance, he defends the ideal possibility of articulating the *successful mediation* of each and every subject with its countervailing world. The various failures to mediate that relation effectively are only and always instructive; they furnish knowledge that leads to more effective

proposals for how to mediate that apparent difference. Each time the subject in *The Phenomenology of Spirit* claims to discover the condition by which the mediating relation works, it fails to take into account some crucial dimension of itself or of the world which it seeks to bind together in a synthetic unity. That which it fails to comprehend returns to haunt and undermine the mediating relation it has just articulated. But that which remained outside the relation is always recuperated by the subject's synthesizing project: there is no final or constitutive failure to mediate. Every failure delineates a new and more synthetic task for the emerging subject of reflection. In a sense, Kierkegaard enters Hegel's system at the end of the *Phenomenology:* if Hegel thought that the subject of the *Phenomenology* had taken account of everything along the way which turned out to be outside the terms to be mediated, understanding *what* needed to be synthesized as well as how that synthesis could take place, then the last laugh is on Hegel's subject. In its mania for synthesis, the subject has forgotten to include that which can never be systematized, that which thwarts and resists reflection, namely, its very existence and its constitutive and mutually exclusive passions: faith and despair.

In Kierkegaard's view, despair is precisely that passion that can never be 'synthesized' by the Hegelian subject.[1] In fact, despair is defined by Kierkegaard as "a misrelation" (*SUD,* 14),[2] one which confirms the failure of any final mediation and, therefore, signals the decisive limit to the comprehensive claims of the philosophy of reflection. Despair not only disrupts that subject's efforts to become at home with itself in the world, but it confirms the fundamental impossibility of ever achieving the self's sense of belonging to its world. The Hegelian project is not only thwarted by despair, but it is *articulated in despair* (*"the category of totality inheres in and belongs to the despairing person": SUD,* 60). As we shall see, one form of despair is marked by the effort to become the ground or origin of one's own existence and the synthetic relation to alterity. A kind of arrogance or hubris, this conceit of the Hegelian project suffers a humiliation at Kierkegaard's hands. To posture as a radically self-generated being, to be the author of one's will and knowledge, is to deny that one is constituted in and by that which is infinitely larger than the human individual. Kierkegaard will call this larger-than-human source of all things human "God" or "the infinite." To deny that one is constituted in that which is larger than oneself is, for Kierkegaard, to be in a kind of despair. Toward the end of this essay, we will consider just how crucial this form of despair is for Kierkegaard's own authorship. Indeed, it may turn out that the despair that Kierkegaard diagnoses in *Sickness unto Death,* and which, in part, he attributes to Hegel, conditions essentially the very writing whose object it is to denounce and overcome despair.

So despair is a "misrelation," a failure to mediate, but what are the

terms to be mediated? And if Hegel fails to understand (his own) despair in the system he articulates, is it also true that Kierkegaard fails to understand the speculative conceptualization that inheres in the very notion of despair by which he counters speculation?

The opening page of *Sickness unto Death* appears to be a properly Hegelian exegesis populated with familiar terminology: 'self,' 'spirit,' 'mediation,' 'relation.' And yet, as the first paragraph proceeds it becomes clear that Kierkegaard is parodying Hegel's language; significantly, however, this is a parody that does not entail a thorough rejection of Hegel. On the contrary, through parodying Hegel, Kierkegaard both recirculates or preserves some aspects of Hegel's system and jettisons some others. Parody functions like the Hegelian operation of *Aufhebungy* set into motion this time, ironically, by Kierkegaard to preserve, cancel, and also transcend the Hegelian corpus itself. The crucial dimension of *synthesis* is, of course, absent from this Kierkegaardian redeployment of Hegel. Parody functions for Kierkegaard as an *Aufhebung* that leads not to synthesis between his position and Hegel's, but to a decisive break. Kierkegaard does not lay out his arguments against Hegel in propositional form. He re-enacts those arguments through the rhetorical construction of his text. If the issues he has with Hegel could be *rationally* decided, then Hegel would have won from the start. Kierkegaard's texts counter Hegel most effectively at the level of style, for part of what he wants to communicate is the limits of language to comprehend that which constitutes the individual. Let us, then, consider the way in which this argument is performed through the parodie reiteration of Hegel at the outset of *Sickness unto Death*.

Kierkegaard begins Part One of this text with a set of assertions and counter-assertions, splitting his own philosophical voice into dialogic interlocutors, miming the dialectical style which dates back to Socrates: "A human being is spirit. But what is spirit? Spirit is the self. But what is the self?" (*SUD,* 13). Then comes a ponderous sentence which one might expect to encounter at the hilarious limits of rationality in a Woody Allen film: "The self is a relation that relates itself to itself or is the relation's relating itself to itself in the relation; the self is not the relation but is the relation's relating itself to itself." The first part of the sentence is a disjunction, but it is unclear whether the disjunctive "or" operates to separate alternative definitions or whether it implies that the definitions that it separates are essentially equivalent to one another. Prior to the semicolon, there appear to be two definitions: one, the self is a reflexive relation (the self is that which takes itself as its own object), and two, the self is *the activity* of its own reflexivity (it is that process of taking itself as its object, incessantly self-referential). If this is an Hegelian exposition, then one expects that this self will achieve harmony with itself, but here it

seems that the more the possibility of a synthesis is elaborated, the less likely that synthesis appears.

In the above quotation, then, we might ask: can the self both be the relation and the activity of *relating*? Can the differently tensed definitions be reconciled? Is the first a static conception, and the second, a dynamic and temporalized one which is incompatible with the second? Or will we learn, Hegelian style, that the static notion is *aufgehoben* in the second, that the temporalized version of the reflexive self presupposes, transforms, and transcends the static one? After the semicolon, the sentence appears to contradict the definition of the self as static relation and to affirm the temporalized version of the self, thereby undermining the possibility of an emerging synthesis between the two versions: "the self is not the relation but is the relation's relating itself to the self." The original ambiguity over whether the "or" functions to set up a mutually exclusive set of alternatives or a set of appositional and equivalent definitions appears temporarily to be resolved into the first alternative.

The development of the sentence echoes the narrative logic of Hegel's *Phenomenology,* but in that text it is more often the case that mutually exclusive alternatives are *first* laid out only then to be synthesized as part of a larger unity. Already in Kierkegaard's style of exposition, we see how the expectation of an Hegelian logic is both produced and undermined. Indeed, as the paragraph proceeds, that failure to conform to Hegelian logic turns into a full-blown illogic, a kind of high philosophical comedy. The rest of the paragraph reads as follows:

> A human being is a synthesis of the infinite and the finite, of the temporal and the eternal, of freedom and necessity, in short, a synthesis. A synthesis is a relation between two. Considered in this way, a human being is still not a self.

Here the development of what appears to be an argument takes several illogical turns and seems by the propelling force of rationality to be spiraling into irrationality. By the end of the first sentence, we have concluded (a) that the self is temporalized, (b) that it is the *activity* of relating, and (c) that it is *not* a static relation. The possibility of a synthesis is therefore negated. This next sentence, however, poses as a logical consequence, but only to make a mockery of logical transition. Here we have the sudden and unwarranted shift from a discussion of the "self" to that of the "human being," and the announcement that the human being is a synthesis. Moreover, the terms of which that synthesis is composed are in no way implied by the static/temporal opposition that preoccupied the preceding sentence. Instead, we find wild generalizations asserted at once in the mode of a conclusion and a premise. As a conclusion that follows

from the earlier sentence, this second sentence makes no sense. As a premise, it is equally absurd: the synthesis is asserted and described, and then the appearance of a conclusion emerges, "in short, a synthesis," which can be read only as a flagrant and laughable redundancy.[3] A didactic sentence follows, which is itself nothing other than a repetition of the obvious: "a synthesis is a relation between two." And then a most curious sentence concludes the paragraph in which Kierkegaard appears to take distance from the Hegelian voice that he has both assumed and mocked. "Considered in this way," the sentence begins, suggesting that there might be another way, Kierkegaard's way, "a human being is still not a self." Here Kierkegaard offers a distinction to suggest that what is called "the human being" is not the same as the self. But interestingly, we are also recalled to the problem of the temporality and tense of the self. What is described as the human being is "still not a self," not yet a self, a self that has not yet been articulated, or, rather, cannot be articulated within the language of synthesis.

Kierkegaard proceeds to take issue with this self which seems never to coincide with itself. He remarks that any synthesis requires a third term. The second and third paragraphs proceed in a note of tentative seriousness, making use of an Hegelian schematic precisely in order to show the way beyond it. The second paragraph begins: "In the relation between two, the relation is the third as a negative unity, and the two relate to the relation and in the relation to the relation." The examples of the terms to be related are the "psychical and the physical" in this textual instance. Kierkegaard argues that if the self is a synthesis of psychical and physical dimensions, and if it is *also* the activity of relating its psychical aspect to its physical aspect, then that very act of relating will have to be composed of one of those aspects. Here he assumes that the activity of "relating," a term that seems to have been kept purposefully abstract in the previous discussion, calls now to be specified as a psychical activity. This more specifie determination of that relating activity will become even more significant as Kierkegaard's text proceeds to distinguish between *reflection,* the Hegelian way of understanding that constitutive relation, and *faith,* Kierkegaard's preferred way. As this semi-Hegelian exposition proceeds, Kierkegaard will show what is concretely at stake for the existing individual in this abstract logic.

Kierkegaard begins here to confound the distinction between the self as a static relation and the self as a temporal or active one. The two dimensions of the self to be related must already in some sense *be* the very relation, which is to say that psychical and the physical, as parts of the relation, are defmitionally related, that is, presupposed as related, and are constantly in the activity of becoming relating. These two dimensions of that relation cannot be captured by a logic of noncontradiction. The

reflexivity of this relation is what marks the relation as a self. For it is the distinguishing feature of a self to endeavor to become itself, constantly and paradoxically to be in the process of becoming what it already is. For one can always refuse to 'relate' to oneself, to endeavor to become a self, but even then that very refusal will still be a way of relating to the self. To deny that one has a self, to refuse to become one: these are not only modes of reflexivity, but specifie forms of despair.

This paradoxical view of the self, as that which incessantly becomes that which it already is, coincides partially with Hegel's view of the subject. Hegel argues that the subject of the *Phenomenology* will develop and become increasingly synthetic, including all that it discovers outside itself in and as the world. And this subject, which successively appears to be identified as life, consciousness, self-consciousness, Spirit, Reason, and Absolute Knowledge, discovers finally that *implicitly* it has always been what it has become. The *becoming* of the Hegelian subject is the process of articulating or rendering explicit the implicit relations which constitute that subject. In this sense, the Hegelian subject is successively discovering what it has always already been, but has not known that it has been. The development of constitution of the Hegelian subject is the process of coming to know what it is that that subject already is.

For Kierkegaard, however, this view of the subject is only partially true. For Hegel, the subject is every aspect of this relation: the subject is itself, the activity of relating, and that to which it relates (since the world, or Substance, turns out to be synthetically unified with the subject). It is precisely this circle of immanence, however, that Kierkegaard tries to break; he performs this break, however, by working Hegel's own logic to its own breaking point. A new paragraph following the above exposition graphically enacts the break with the Hegelian argument. Kierkegaard states an either/or question that cannot be asked within the Hegelian framework: "Such a relation that relates itself to itself, a self, must either have established itself or have been established by another." Here Kierkegaard raises the question of the genesis of this relation. It is not enough to know what the relation constitutes, nor to know that in some way it constitutes itself. The question remains: What has constituted this relation as a self-constituting relation? What put this circular relation into motion? Kierkegaard infers that there must be a relation that is temporally prior to the self-constituting self, that this prior relation must be reflexive and constituting as well, and that the self must be one constituted product of that prior relation. This prior relation appears to be God, although Kierkegaard almost never supplies a definition of God.

PASSIONATE SELVES AND THE AFFIRMATION OF FAITH

In *Concluding Unscientific Postscript* (1846), Kierkegaard makes clear that he is not interested in proving rationally that God exists, but only in the question of how to achieve faith as it arises for the existing individual: how do I become a Christian, what relation can I have to faith?[4]

If that which constitutes the self remains part of that self, then the self whose task it is to take itself as its own object will of necessity take that prior ground of its own existence as its object as well.[5] It is in this sense that for Kierkegaard the self which takes itself as its own object will of necessity take "another" as its object as well. In Hegel, this same formulation applies, but the "other" who constitutes the self will be the social other, the community of other subjects who collectively supply the common social and historical world from which the particular subject is derived. That move, however, is for Kierkegaard symptomatic of a refusal to see that which transcends the social and human world, namely, the transcendent or the infinite from which the social world in its concreteness is derived.

The task of the self, for Kierkegaard, is indissolubly twofold: self-constituting yet derived, the self is "a relation that relates itself to itself and in relating itself to itself relates itself to another" (*SUD,* 13–14). Insofar as "another" is infinite, and this prior infinity constitutes the self, the self partakes of infinity as well. But the self is also determined, embodied, and hence finite, which means that every particular self is both infinite and finite, and that it lives this paradox without resolution. Faith will be described by Kierkegaard as infinite inwardness, the unceasing and passionate affirmation of the infinite, and in this sense faith will be an occasion for infinity to emerge within the self: "that which unites all human life is passion, and faith is a passion" (*FT,* 67).[6] In yet another sense, that self, however capable of infinite faith, will never be equivalent to the infinity that is prior to the individual, which Kierkegaard calls "God," but which is sometimes figured in terms of infinite possibility.[7] However infinite in its passion and faith, the self is still *existing* and, hence, finite. Strictly speaking, the infinity prior to the self, the infinity from which the self emerges, does not *exist*. For unactualized and infinite possibility to exist, it would have to become actualized, which is to become finite and, hence, no longer to be definable as infinite possibility. This infinite possibility, this ground or God, cannot be known or affirmed as a finite object, but can only be affirmed by a passionate faith that emerges at the very limits of what is knowable.

This is an affirmation that cannot take place through rationality, language, or speculation; it emerges as a passion and a possibility only on the condition that reflection has failed. In Kierkegaard's *Philosophical Fragments* (1844), he refers to this crisis in speculative thought as "the passion of Reason" and "the passion in all thinking" (*PF,* 46).[8] Here passion carries the meaning of suffering and longing, and Kierkegaard appears to imply that passion is generated precisely at the moment in which thought fails to grasp its object. Because part of what is meant by comprehending an object is comprehending its origin, and because that origin or ground is the infinity of God, every act of knowing is haunted by the problem of faith and, hence, also by passion. Kierkegaard commentator Niels Thulstrup describes this passion as "something which reason cannot comprehend and which leads reason to founder in its passion, the passion which wills the collision, which strives to discover that which cannot be thought and cannot be comprehended in the categories of human thought."[9] In the face of the infinite, thought can only supply a finite concept or a word, but both of these are finitizing instruments which can only misconstrue and, indeed, *negate* that which they seek to affirm. This is, of course, also the problem with Hegel's reliance on the concept to grasp infinity.[10]

One might be tempted here to think that Kierkegaard proposes that the self overcome its finitude in order to affirm through passionate inwardness the infinity from which that self emerges. But that is, for Kierkegaard, an impossibility. And here is where he appears to take Hegel seriously, even as he finally disputes him: the self is inevitably both finitude and infinitude which the self lives, not as a synthesis, and not as the transcendence of the one over the other, but as a perpetual paradox. Inasmuch as the self is self-constituting, that is, has as its task the becoming of itself, it is finite: it is *this* self, and not some other. Inasmuch as the self is derived, a possibility actualized from an infinite source of possibility, and retains that infinity within itself as the passionate inwardness of faith, then that self is infinite. But to reconcile existence and faith, that is, to be an existing individual who, in its finitude, can sustain itself in infinite faith, that is the paradox of existence, one which can only be lived but never overcome. As Kierkegaard puts it with characteristic irony: "to be in existence is always a somewhat embarrassing situation" (*CUP,* 404).

Let us return then to the sentence from *Sickness unto Death* which suggests that the Hegelian subject, reconceived as a self (with the capacity for inwardness), and understood as derived from an infinite source, is both self-constituting and derived, "a relation that relates itself to itself and in relating itself to itself relates itself to another." This sentence, which appears logical and to some extent implicitly theological, leads to the introduction of despair as a psychological category:

> This is why there can be two forms of despair in the strict sense. If a human self had established itself, then there could be only one form: not to will to be oneself, to will to do away with oneself, but there could not be the form: in despair to will to be oneself.
>
> (*SUD,* 14)

Despair is the result of the effort to overcome or solve the paradox of human existence. If one seeks to be grounded in the infinite and to deny that one exists and is, therefore, finite, one falls into the despair of the infinite, willing not to be the particular self that one is. But if one denies the infinite and seeks to take full responsibility for one's own existence, viewing all of one's self as one's own radical creation, that is the despair of the finite.[11] It is this second form of despair, the despair of willing to be oneself, that is, to be the ground or sole source of one's own existence, that is more fundamental than the first. This second form constitutes a refusal to be grounded in that which is more infinite than the human self and so constitutes a defiance of God. The primary way in which human selves fall into despair is through the repudiation of their infinite origins. This despair is marked by a certain hubris or arrogance and, at its limit, becomes demonic, understood as a willful defiance of the divine. We will consider that demonic extreme of despair toward the end of our remarks when we consider Kierkegaard's ambivalent relationship to his own authorship.

What this means, of course, is that if one knows one is in despair and seeks *by one's own means* to extricate oneself from despair, one will only become more fully steeped in that despair. That self is still trying to refuse its groundedness in that which is greater than itself. Paradoxically, the self that refuses the infinite must enact that refusal *infinitely*, thereby recapitulating and reaffirming the infinite in a negative way in the very gesture of disbelief. If Hegel thought that the subject might be a synthesis of finite and infinite, he failed to consider that that subject, reconceived as a self with inwardness, can never mediate the absolutely qualitative difference between what is finite in that self and what is infinite. This failure of mediation is what underscores the paradoxical character of existence; the passionate and nonrational affirmation of that paradox, an affirmation that must be infinitely repeated, *is faith;* the effort preemptively to resolve this paradox is the feat of despair. In this sense, despair marks the limit of dialectical mediation or, rather, every effort at mediation will be read by Kierkegaard as symptomatic of despair. Every synthesis presumes and institutes a *repudiation* of that which cannot be comprehended by thought; infinity is precisely that which eludes conceptualization. That refused infinity returns, however, as the infinite movement of despair in the existing individual who seeks to resolve the

paradox of existence through thought. Through the invocation of despair, Kierkegaard marks out the limits of the Hegelian ideal of synthesis: "Despair is the misrelation in the relation of a synthesis that relates itself to itself" (*SUD,* 15).

The Hegelian ideal of becoming at one with oneself is achieved through one's social relations and through one's relation to everything that is outside the self. For Hegel, the subject discovers that other human beings and objects are part of its own identity, that in *relating* to others and to objects, the human subject enacts (or actualizes) some of its own most fundamental capacities. Hence, the subject achieves a certain oneness with itself through relating to that which is different from itself. This oneness, however, is not a possibility for the Kierkegaardian self. As much as that self might want to affirm itself as the ground or origin of its own relations with others, it is bound to fail. This self can take responsibility for its own capacities by denying that it is itself produced by that which is greater than itself. That is one kind of despair, the despair of willing to be oneself. On the other hand, if that self tries to relinquish all responsibility for itself by claiming that some greater and infinite reality, God, has produced everything about that self, then that self is in a different kind of despair, the despair of willing not to be oneself. There is no escape from this paradox. Hence, to be a self means either to be in one of these two forms of despair or to have faith. But in both despair and faith, this paradox is never resolved. In despair, one lives one side of the paradox and then another (one takes radical responsibility for oneself or not at all), but in faith, one affirms the paradox, taking responsibility for oneself at the same time affirming that one is not the origin of one's existence.

One might ask, is one always either in despair or faith? The answer for Kierkegaard is yes. For the most part, human beings live in despair, and they do not even know that they are in despair. In fact, this not knowing that one is in despair is a symptom of despair. The person who does not know that there is a task, a struggle to affirm oneself in this paradoxical way, makes some set of presumptions about the solidity of its own existence which remain unquestioned and, hence, outside the difficulty of faith. And there appears to be no way to faith except through despair. But faith for Kierkegaard does not provide a solution for the paradox of the self. Indeed, nothing provides such a solution. The self is an alternation, a constant pitching to and fro, a lived paradox, and faith does not halt or resolve that alternation into a harmonious or synthetic whole; on the contrary, faith is precisely the affirmation that *there can be no resolution.* And insofar as 'synthesis' represents the rational resolution of the paradox, and the paradox cannot be resolved, then it follows that faith emerges precisely at the moment at which

'synthesis' shows itself to be a false solution. This is, as it were, Kierkegaard's last laugh on Hegel. Whereas Hegel argues that the failure of any given synthesis points the way to a greater and more inclusive synthesis, Kierkegaard tries to show that synthesis itself, no matter how inclusive, cannot resolve the paradox of the self. Concretely, this difference between Hegel and Kierkegaard implies that the self will ultimately have a very different experience of and in the world. For Hegel, the subject will eventually find a unified and harmonious relation with what appears at first to be outside itself, so that it can, ideally, find itself at home in the world, 'of ' the world that it is 'in.' But for Kierkegaard, that which is 'outside' the finite self, namely, the infinite, is also 'within' the self as freedom and the dual possibility of despair and faith (all of which are 'infinite' passions, passions that can have no end); further, the infinite that persists as the ground of the finite self or within the self as its own passion will never fully belong to the finite self or the finite world in which it nevertheless exists in some less than apparent way. Hence, for Kierkegaard, the infinity that is the source of the self and which persists in the self as its passion will never fully be 'of' the world in which it dwells. The self, for Kierkegaard, will be perpetually estranged not only from itself, but from its origins and from the world in which it finds itself.

One might imagine an Hegelian rejoinder to Kierkegaard's affirmation of the paradoxical self. Hegel might argue that if there is something in the self which is infinite, that infinity must nevertheless *appear* in some way in order to be *known*. In Hegelian language, one might say that for the infinite to become actual and, hence, knowable, it must become determinate or appear in some form. And Hegel imagined that certain kinds of concepts could be both finite (particular, determinate, specific) and infinite (nonspecific, indeterminate, unbounded). Hegel wanted to arrive at a concept, understood as a kind of speculative thought, in which the finite and the infinite would not only coexist, but be essentially dependent on one another. Imagine a thought which would be *your* thought, specifically yours, and therefore determined and specific, but which would *at the same time* be a thought of that which is infinite and, hence, not bound to you at all, indeed, not bounded or limited by anything. Hegel imagined that the thought of the infinite depends on the determinate thinker, the place and existence of that thinker, at the same time that that infinite thought exceeds that determinate place and thinker. In this sense, the infinite thought depends on the finite thinker in order to be thought, in order to have its occasion and its form; and the finite thinker is no thinker, that is, is not really thinking, thinking thought through to its infinite possibility, unless that finite thinker is able to think the infinite. Hence, for Hegel, a mutual dependency exists between that

which is finite and that which is infinite in the human subject, where both the finite and the infinite form the project of thinking.

Kierkegaard's rejoinder is firm. If one tries to *think* the infinite, one has *already* made the infinite finite. There can be no thinking of the infinite, for the infinite is precisely that not only which cannot be thought, but which insistently forces a crisis in thought itself; the infinite is the limit of thinking, and not a possible content of any thought. To the Hegelian claim that the infinite must first *appear* before it can be known, Kierkegaard would have to respond that the infinite can neither appear nor be known. Hence, it is to some extent *against* Hegel that Kierkegaard formulates his notion of the infinite and, therefore, also of faith: the infinite eludes the dialectic, the infinite cannot be grasped or 'Understood' by any rational effort of thought or synthesis. The infinite can be affirmed nonrationally and, hence, passionately, at the limits of thought, that is, at the limits of Hegelianism.

FEAR, TREMBLING, AND OTHER INWARD PASSIONS

This opposition to Hegel puts Kierkegaard in a bind, for Kierkegaard is *a writer,* he puts his opposition to Hegel into words, and he produces concrete and determinate texts, finite things, which house his claims about that which is infinite. How do we understand Kierkegaard, the finite man or 'existing individual,' in relation to this notion of the infinite that can never fully be expressed by any finite or determinate statement or text. As finite expressions, Kierkegaard's own texts, the *Sickness unto Death* itself or *Fear and Trembling* (1843), can only *fail* to express the very notion of infinity that they seek to communicate. Whereas an Hegelian might argue that Kierkegaard's writing of the infinite is itself essential to the infinite that it expresses, Kierkegaard's response will be that if there is an infinite that can never be resolved with the finite, then Kierkegaard's own texts will always *fail* to communicate the infinite. Indeed, Kierkegaard's response will be: 'My texts *must* fail to express the infinite, and it will be by virtue of that *failure* that the infinite will be affirmed. Moreover, that affirming of the infinite will not take the form of a thought; it will take place at the limits of thought itself; it will force a crisis in thought, the advent of passion.'

So, for Kierkegaard to set about to write a book against Hegel, against synthesis, and in favor of passion and faith, he must write a book that fails to communicate directly the very passion and faith he seeks to defend. An author cannot embody or express the infinite, for that 'expression' would

inadvertently render finite that which must remain infinite. Indeed, the words "passion" and "faith" cannot express or communicate passion and faith; they can only *fail* to communicate, and in failing, *point the way* to an affirmation that is fundamentally beyond language. Aware of this paradoxical task of trying to write about that which cannot be delivered in language, Kierkegaard insists upon the necessity of indirect communication, a kind of communication that knows its own limitations, and by enacting those limits, indirectly points the way to that which cannot be communicated.

Evidence of Kierkegaard's views on indirect communication can be found in the fact that he often wrote and published under a pseudonym. *Sickness unto Death* was published with "Anti-Climacus" as its author. *Fear and Trembling* was written by "Johannes de Silentio," and *Philosophical Fragments* by "Johannes Climacus," also the author of *Concluding Unscientific Postscript*. Other pseudonyms include "Constantin Constantius" (*Repetition,* 1843) and "Victor Eremita" (*Either/ Or,* 1843). The use of a pseudonym raises the question of who is the author behind the author? Why is Kierkegaard hiding? What is it that is concealed in this writing, and what is it that is revealed? Does the author mean to say what he says, or does the pseudonymous author allow the 'real' author to write what he would not write under his own name. What does it mean to write under the name of another? I do not want to suggest that pseudonymous authorship always works in the same way or for the same reasons in Kierkegaard's work. But it does seem directly related to the problem of writing the infinite that we mentioned above. The false name suggests that whatever is written under that name does not exhaust the full range of what the author, Kierkegaard, might be. Something is not being uttered or expressed or made known. Minimally, it is Kierkegaard the man who to some degree hides behind the fictional author under whose name he writes. On an existential level, however, there is something in every self which *cannot be expressed* by any act of writing. There is that in every self which is silent, and Kierkegaard is clear that in the end faith, and passion more generally, is not a matter of writing or speaking, but of remaining silent.

If Kierkegaard's texts, then, are to be works of faith, they must not only be a labor of language, but a labor of silence as well. This is suggested by the pseudonym "Johannes de Silentio," the 'author' of *Fear and Trembling*. And in that text, we encounter the figure of Abraham whose silence cannot be understood by the author. Indeed, Abraham stands for faith; he is called "a knight of faith," and yet he does not speak and leaves us no clues by which we might be able to find reason in his faith. The author tries repeatedly to understand Abraham's faith, but fails.

What is the story of Abraham, and what is the nature of Abraham's faith? Abraham receives a sign from God that he is to take his son to the top of a mountain, Mount Moriah, and there to slay his son as an act of faith. According to the Bible, Abraham does not tell Isaac, his son, what he is about to do, and neither does he tell Sarah, his wife. Through the pseudonym of Johannes de Silentio, Kierkegaard opens *Fear and Trembling* by telling the story of Abraham several times. Each effort to narrate what happened with Abraham is also an effort to fathom how it is that Abraham could prepare himself to act in such a way. If Abraham were willing to slay his son, he risks becoming a murderer according to conventional ethical norms; he destroys his own son, his own family, breaking the most cherished of *human* bonds. Johannes de Silentio tries to fathom how it could be that Abraham, who loved his son, was nevertheless willing to defy, resist, or suspend that love as well as one of the most fundamental laws of ethics in order to perform his faith. What kind of faith has God exacted from Abraham such that he must prepare himself to sacrifice that worldly connection that is most important to him. Is this a cruel God, one to be disobeyed? And why does Abraham persist in his course, silently bringing Isaac to the top of Mount Moriah, and draw his hand only *then* to have his hand stayed by God?

The example is, of course, a shocking one, but Kierkegaard rehearses that scene of Abraham climbing Mount Moriah, drawing the sword, and he tries to understand how any human being could turn against that which is most important to him in the world. Abraham supplies no explanation, and Kierkegaard leads us to the point of understanding that there can be no explanation in words. In the name of what? For what higher good? For Johannes de Silentio, the answer never comes, but the questions repeat themselves insistently, exhausting language and opening out into the silent void of faith.

Kierkegaard imagines how it would be for Abraham to feel the full force of his love for Isaac and at the same time follow the dictate of a faith that requires the sacrifice of Isaac. This is surely a paradox, and in the story of Abraham we receive from Kierkegaard something like an allegory of the paradoxical self. There is no way to reconcile the profoundly finite and worldly love of a father for his son with a notion of faith which is infinite, 'in' the world but not 'of ' it. This is precisely the kind of paradox that cannot be thought, cannot be resolved into some harmonious solution, but which wrecks thought, forces an exposure of thought itself. In Kierkegaard's indirect words: "I cannot think myself into Abraham" (*FT*, 33); "For my part, I presumably can describe the movements of faith, but I cannot make them" (*FT*, 37); "faith begins precisely where thought stops" (*FT*, 53).

But Kierkegaard is not only horrified by the sacrifice that faith has exacted from Abraham. He is also appalled by the fact that Abraham appears to get Isaac back, that God not only asks for a sacrifice, but returns what has been lost, and all this *without reason*. Furthermore, it appears that Abraham does not turn against the God who has, it seemed, played so cruelly with the most precious object of Abraham's human love:

> to be able to lose one's understanding and along with it everything finite, for which it is the stockbroker, and then to win the very same finitude again by virtue of the absurd—this appalls me, but that does not make me say it [faith] is something inferior, since, on the contrary, it is the one and only marvel.

On the one hand, Kierkegaard is appalled by the *arbitrariness* and whimsical character of the way in which God is figured here as giving and taking away. On the other hand, Abraham's faith is a marvel, since it does not waver in the face of the alternating beneficence and cruelty of this ultimate authority. Abraham is not shrewd with respect to God. Abraham does not figure that if he only acts as if he is willing to sacrifice Isaac, God will stay his hand: "he had faith by virtue of the absurd, for all human calculation ceased long ago" (*FT*, 36). If faith designates the limit of thought, if faith emerges precisely when thought fails to comprehend what is before it, then Abraham climbs the mountain and draws the sword *without knowing* that God will return Isaac to him. What is awesome in Abraham is that he sustains his faith *without knowing* that he will receive Isaac back. Faith is not a bargain; it is that affirmation that emerges when all bargaining has failed. This is what Kierkegaard means when he claims that Abraham has faith by virtue of the absurd. And if faith is a leap, it is a leap beyond thought, beyond calculation, a leap made from and with *passion* that can be neither comprehended by thought nor communicated through language.

In *Fear and Trembling,* Kierkegaard claims that he cannot yet make this leap, but that he can only trace its steps and applaud that movement as a marvelous thing. He knows enough to recognize that Abraham must have been in anxiety at the moment in which he drew that sword. And whereas there are those who would defy God and return to the ethical world, refuse to draw the sword, and allay their anxiety in that way, Abraham is not one of them. And whereas there are those who would turn against their love for Isaac and deny the importance of that bond, Abraham is not one of them. He turns against neither the finite (Isaac) nor the infinite (God), but prepares for the paradoxical affirmation of both. In preparing to sacrifice Isaac, however, Abraham performs "the teleological suspension of the ethical" (*FT,* 54). This is not the denial of ethics, but the

suspension or post-ponement of the ethical domain in the name of that which is higher, namely, the infinite or the divine. The human and finite world is grounded in that which is larger than itself, namely, the infinite, and there are occasions in which the affirmation of that infinity takes priority over the affirmation of that finite and ethical domain which is the product of that infinity. But this suspension of the ethical entails anxiety, and faith does not resolve anxiety, but exists with it. Any finite individual can have faith only by contracting anxiety, for all faith involves some loss or weakening of worldly connections, including the worldly connection to one's own finite, bodily self. There is in faith a dying away of the finite self, this body, this name, these worldly connections to family, friends, lovers, this belonging to a time and a landscape, a home, a city. Faith underscores that all those finite things in which we are invested are perishable, and that there is no necessary reason or assurance that they will remain as we know them or survive at all.

If the story of Abraham is an allegory of faith, and if Abraham himself is a figure for faith, then we can read the story for its more general philosophical implications. Aristotle once claimed that philosophy begins with a sense of wonder, the wonder that there are things rather than no things. Aristotle's 'wonder' is not so different from Kierkegaard's sense of the marvelous in his encounter with Abraham's faith. For Aristotle, wonder emerges over the fact *that* there are things, not over *how* things came about—although that interested him, too—but that things came about at all. Kierkegaard writes of "the emotion which is the passionate sense for coming into existence: wonder" (*PF,* 99). In Kierkegaard's terms, it is, on the one hand, a marvel that these specific finite beings, humans, the elements, objects of all kinds, came into the world rather than some other set of beings. On the other hand, it is terrifying that all that exists appears to come into the world for no necessary reason at all. For if there is no necessary reason that things came into the world, there is no necessary reason that sustains those very things in the world, and there is no necessary reason that keeps those things from passing out of the finite world. If these finite beings came into the world from a set of infinite possibilities, then why is it that, of all the myriad and countless beings that came into the world, *these* came into being? There appears to be no necessity that *these* beings came into existence, and that others did not, if we consider that the source or origin of all things is infinite possibility, another name for God. But the wonder or marvel is provoked by another realization as well. If that which exists in the finite realm is the actualization of a set of possibilities, and this set of possibilities is only a subset of the infinite possibilities that are not actualized in the existing world, then how do we account for which possibilities made the *passage* from infinite possibility into that which exists in the finite world? No

reason can be supplied: there is no necessity for what exists to exist. In fact, not only is there no necessity for the infinite, God, to create the finite, the human world, but it is perfectly absurd that he did at all.

The finite is grounded in the infinite: we know this from Kierkegaard's analysis of despair. But the finite never fully expresses the infinite which is its origin. Precisely to the extent that an existing individual, for instance, is finite, that is, limited, mortal, located in space and time, and bodily, that individual is clearly not infinite and, hence, does not fully express the infinity out of which he or she (absurdly) arises. This passage from the infinite to the finite cannot be thought; it is wondrous and a marvel, but also quite terrifying, for there is no necessary reason for anything to exist or, for that matter, to persist in its existence, that is, to stay alive. Whatever God is for Kierkegaard, 'he' (Kierkegaard tends not to personify God) is not that which supplies a reason or a necessity for that which exists. On the contrary, the postulation of the Kierkegaardian God underscores that existence itself is absurd.

The story of Abraham suggests that whatever exists in this world does so by virtue of a kind of grace, an arbitrary and irrational act. Existence can be understood as a kind of unexpected gift, one which comes just as easily as it is taken away. To have faith means to affirm this contingency, this absurd coming-into-being of existence, regardless of the suffering that recognition of absurdity causes. To transform the terror produced by the recognition of existence in its absurdity is no easy task. Indeed, the aesthete and the ethicist cannot find relief from this terror; they are in despair to the extent that they are run by this terror and involved in sensuous or ethical endeavors which seek to quell the anxiety produced by the fact of human contingency. The Knight of Resignation in *Fear and Trembling* can be understood as a figure at the limit of the ethical domain, tracing the movements of faith, but not able to make the necessary leap. As a consequence, he is *horrified* by the prospect of Abraham's 'sacrifice' of his own son; indeed, the Knight of Infinite Resignation can understand Abraham's intended act as a murder—and not a sacrifice or offering to God.

We might then understand the movement from the ethical domain to that of faith as the transformation of terror into a sense of grace. The difficulty with making this movement, however, is that the prospect of losing one's worldly attachments, indeed, one's own finite existence for no necessary reason, is not easy to face with anything other than terror. Kierkegaard understood that the task of faith would be especially difficult to accomplish by those who lived according to the romantic impulse to invest existing individuals with such enormous value that they cannot imagine themselves continuing to exist in a world without them. This was the anguished predicament of the young man in *Repetition,* and there is good evidence to support the view that Kierkegaard himself felt just this

way about Regine Olsen with whom he broke off an engagement to be married. This broken engagement can be understood as Kierkegaard's own 'sacrifice' which, from an ethical point of view, appeared to be the emotional equivalent of murder.

In the midst of Kierkegaard's discussion of Abraham's faith in *Fear and Trembling,* he remarks with due irony that if Hegel's philosophy were right, then Abraham would, indeed, be a murderer. For Kierkegaard, Hegel represents the ethical domain, for in Hegel's *Phenomenology of Spirit* and *Philosophy of Right,* he argues that the individual realizes his or her true and proper purpose in a community bound by *ethical* laws. Indeed, Hegel argues that if an individual holds him- or herself to be above the ethical law, that individual is sinful. Kierkegaard objects to Hegel's characterization of the assertion of individuality as sin. According to Kierkegaard, Hegel fails to understand that the individual is higher than the universal ethical norm, that there are times when ethical laws must be 'suspended' or 'surrendered' so that a higher value can be affirmed, namely, the value of faith—which, of course, for Kierkegaard, is always an *individual* affair. The relation to God cannot be mediated (this belief aligns Kierkegaard with Luther). Hegel would believe that God is present in the ethical law, and that individuals, by submitting to the ethical law, come into a mediated relationship to God. This happy reconciliation of the ethical (called 'the universal') and the religious (called 'the absolute') is one that Kierkegaard firmly rejects. The middle term, the ethical or 'universal,' which Hegel understands to mediate between the individual, on the one hand, and the divine, on the other, is, for Kierkegaard, precisely that which must be subordinated and suspended for the absolute and immediate relation of faith to take place between the individual and God: "this position cannot be mediated, for all mediation takes place only by virtue of the universal; it is and as such remains for all eternity a paradox, impervious to thought" (*FT,* 56).

In Kierkegaard's view, Hegel's ethical community requires the sacrifice of the individual to an anonymous law. As law-abiding citizens, we are interchangeable with one another; each of us expresses our true and proper self through the same acts by which we conform to a law which applies to all human beings regardless of our differences. In this sense, none of us are individuals before the law or, rather, each of us is treated by the law as an anonymous subject. Insofar as Abraham takes distance from the ethical law which prohibits murder, he becomes an individual, and the more he refuses to honor the authority of that law over his own existence, the more individuated he becomes. This act of putting into question the ethical law as a final authority over one's life engages Abraham in anxiety, for in questioning the law, Abraham encounters his own being apart from the ethical community in which he stands.

Opposing himself to Hegel's notion of individuality as sin, Kierkegaard values this anxiety as human freedom, the demand to make a decision whether or not to comply with the law or whether to follow a higher authority. Although Hegel appears to worry about such a moment in which the individual stands apart from the ethical community, suspending the power of its laws to govern his or her life, Hegel also appreciates fear and trembling as necessary moments in the development of the human subject.[12] Significantly, Kierkegaard does not acknowledge that moment in Hegel in which fear and trembling are considered to be necessary experiences in the acquisition of human freedom. We can find that moment at the end of Hegel's well-known chapter in the *Phenomenology* entitled "Lordship and Bondage." There the bondsman who has been the property of the lord has cut himself loose from his own enslavement. What we might expect is the jubilant celebration of freedom, but what we encounter in the emerging bondsman instead is a shattering fear. Consider the following description of the emancipated bondsman from Hegel's *Phenomenology of Spirit* as an example of the fear and trembling produced by the experience of human freedom temporarily untethered by authority. The bondsman labors on objects, and for the first time *recognizes* his own labor in that which he makes. In the recognition of *himself* in the object of his making, he is struck with fear:

> the formative activity…has the negative significance of *fear*. For, in fashioning the thing, the bondsman's own negativity [his freedom] becomes an object for him…this objective *negative* moment is none other than the allen being before which it has trembled.
>
> (*PS*, 118)[13]

Whereas the bondsman has been afraid of the lord, he is now frightened of his own freedom now that that freedom has become that which 'lords' over his own existence. A few lines later, Hegel continues with a passage that further links the expression of freedom through work with the experience of fear:

> Without the formative activity, fear remains inward and mute, and consciousness does not become explicitly *for itself*. If consciousness fashions the thing without that initial absolute fear, it is only an empty self-centred attitude…. If it has not experienced absolute fear but only some lesser dread, the negative being has remained for it something external [its freedom still appears to belong to another and is not yet its own], its substance has not been infected by it through and through.
>
> (*PS*, 119)

Hegel goes on to remark that if the bondsman has not been shaken by fear in the very fiber of its being, it will remain "a freedom enmeshed in servitude."

We can begin to see here that Kierkegaard's characterization of Hegel is not always fair. Hegel is clearly not in favor of the enslavement of the individual to the ethical law, for the fear and trembling associated with the moment of emancipation will inform the individual as he or she enters ethical life in the following chapter in the *Phenomenology.* Indeed, one might well ask the question of whether Kierkegaard's very language of "fear and trembling" is not derived from Hegel's description of the emerging bondsman in *The Phenomenology of Spirit.* How far is the bondsman's trembling at the sight of his own freedom from Abraham's anxiety in the face of his own potential act? How do these 'tremblings' differ?

Whereas Hegel's bondsman trembles before that which he has created, the external confirmation of his own power to create, Abraham trembles (inwardly) before that which he is compelled by God to sacrifice and destroy. Whereas the bondsman is frightened of his own capacity to create, a capacity which in its apparent limitlessness makes the bondsman into a figure with enormous responsibility and power, Abraham is compelled to act according to a divine demand that he cannot understand. In this sense, Abraham's freedom is not guided by reason, but by that which is irrational, beyond reason, and which requires an obedience to that irrationality over any human law. The bondsman, on the other hand, appears to legislate a law for itself, expressed in its own 'formative activity' or labor. The bondsman appears to be temporarily without an authority, a 'lord,' who is other to himself. But Abraham, he is enthralled to a Lord who is so radically different from himself that he cannot understand him at all. That the bondsman is compelled to be free without the guidance of a supervening authority is an unbearable situation which leads to the development, in the following chapter on the "Unhappy consciousness," of a *conscience,* the self-imposition of an ethical law, what Hegel himself understands as a form of self-enslavement. Hence, Hegel's bondsman retreats from the fearful prospect of his own freedom through enslaving himself to ethical projects and practicing various rituals of self-denial. Abraham, on the other hand, must bind himself to an authority whose demands are incomprehensible, an act which leaves him frighteningly detached from the ethical community and from his own rational capacities. Kierkegaard tells us that it is through this persistence in fear and trembling that Abraham comes to the full and gracious experience of faith.

The task of faith is to continue to affirm infinite possibility in the face of events which appear to make existence itself a radically impossible

venture. What astonished Kierkegaard about the Abraham story is that Abraham faced the prospect of losing what was most precious to him in the world, and he still did not lose faith and curse God: he maintained his faith not only in the face of that loss, but in the face of having to make the sacrifice himself.[14] Abraham loves Isaac, but that human bond cannot be the most important passion of his life, for what merely exists can come and go, and that transience can never be the object of faith. If in the throes of romantic love or in the complicated emotional ties of family life, we say that our existence is meaningless without some existing individual, that is a symptom that we are in despair. For Kierkegaard, if any existing individual becomes the fundamental reason to live, that individual must be sacrificed so that faith can return to its proper object: the infinite.

In *Repetition,* published simultaneously with *Fear and Trembling,* Kierkegaard relates the story of how a young man, a thinly veiled substitute for Kierkegaard himself, breaks off an engagement with a girl he loves. The sacrifice appears absurd, for he has not fallen out of love with her. And yet, if the girl has become the ultimate reason for living, the source of all affirmation, then the young man has transferred and invested the boundlessness of his passion onto an existing individual: this is, for Kierkegaard, a kind of despair and a failure of faith. Precisely because she has become an object he is not willing to lose, he must demonstrate his willingness to lose her altogether. His sacrifice is not unlike Abraham's, except that Abraham, being a "Knight of Faith," receives Isaac back again, whereas the young man, a veritable "Knight of Resignation," appears to orchestrate and suffer an irreversible loss. He knows how to sacrifice finite things, and to avoid the despair that characterizes the life of the aesthete as well as the ethicist, but he does not know how to affirm that infinity which appears to make existence utterly absurd.

What does it mean that whereas Abraham receives Isaac back, the young man in *Repetition* fails to have his love returned? To have faith means no longer to invest absolute meaning in what is finite, whether it is an individual person, a set of objects or possessions, a homeland, a job, a family. All of these sites of investment are finite and perishable, and when we transfer religious passion onto those things, according to Kierkegaard, we turn away from God and invest the things of this world with a displaced religious meaning and, hence, fall into despair. If one makes the leap of faith, then one invests absolute passion and meaning in the infinite; this entails a suspension not only of the ethical, but of the finite realm altogether, for any finite object of passion will now be understood as emerging as a gift from the infinite and passing back eventually into the infinite. For Kierkegaard, it is only once we affirm the transience and contingency (nonnecessity) of that which we love in this world that we are

free to love it at all. If Abraham gets Isaac back, it is because he has suspended his attachments to that which is finite, affirmed the infinite, and so understood that nothing that exists in this world can sustain an absolute passion. It is in this sense that Isaac was *always* a gift from God; one's own existence is a gift, and that of every other existing thing.

Of course, to recognize that there is no necessary reason that some beings exist and other possible beings do not produces not only a sense of wonder, but a sense of terror as well. The thought of an existing life as a contingency, as an arbitrary event which just as well *could not* have happened, or which could without reason pass away, this is a thought that, strictly speaking, cannot be maintained; it is a thought which founders on itself, for how can a thought think the contingency of the thinker who thinks it? But it is this thought that leads to the anxiety over existence that leads to the question of faith. To witness the existing world this way, as a terrifying and wondrous gift, is to know that one is not the author of that world, that the father, strictly speaking, is not the 'origin' of the son, and that not only do all things originate—absurdly, wondrously—in the infinite, but all existing things return there as well.

For Kierkegaard, this problem of the contingency of existence has implications for human love, a passion that verges on faith, but which becomes despair when it becomes too much like faith, an absolute or infinite passion. To love that which exists without at the same time knowing the fragile and contingent nature of existence is to be in despair; if one tries to love a human object as if it were absolute, one projects a religious passion onto a human object. The result, for Kierkegaard, is to become wracked with displaced passion and a constant sense of loss. Kierkegaard describes this problem at some length in the first volume of *Either/Or.* Considered to be part of Kierkegaard's early writings, *Either/Or* is composed of two volumes. The first offers writings that enact and explore the *aesthetic* point of view; the second volume offers sermons and treatises in the *ethical* point of view. Neither of these perspectives is the same as faith, but Kierkegaard, in unmistakenly Hegelian fashion, suggests that these two spheres, these two ways of approaching the world, have to be experienced in order to understand the limits of each and the superiority of faith. There is no writing in the perspective of faith in either of these volumes, but it is unclear that such a writing could exist; faith is nevertheless there in the writings as the path not chosen, the way to affirm the paradox that emerges between the aesthetic and ethical perspectives.

The vain effort to make of a human being an object of absolute and infinite passion is the fateful predicament of the aesthete in *Either/Or.* The alternative in that text is to become a purely *ethical* being, one who makes no attachments to anything finite, but acts in accordance with a universal law, a law that applies to everyone, and which makes of its obedient

subject an anonymous and impersonal subject. The aesthete, on the other hand, values what is most immediate and finite as if it were absolute; the ethical person (also termed the "Knight of Infinite Resignation") treats the human law as if it were absolute, and invests his or her full passion into the application of that law. The one in faith, however, lives fully in the finite world, but affirms its contingency at the same time. This is the marvel that Kierkegaard claims he cannot perform, to love that which exists and to affirm that it might be lost, that it cannot serve as the ultimate object of passion, that for which one lives. Human love requires the knowledge of grace, that what is given for us to love is not ours, and that its loss refers us to that which is the origin of all things finite, including ourselves. This means that for the one who has faith, love is always an anxious and ironic affair, and there is no way to see directly how that infinite faith in that which is infinite lives alongside the finite love of that which exists. In Kierkegaard's terms, "absolutely to express the sublime in the pedestrian—only that the knight [of faith] can do it, and this is the one and only marvel" (*FT,* 41).

One implication of Kierkegaard's paradoxical view of faith is that it is *not* a form of asceticism. Kierkegaard does not advise a turning away from the finite world. On the contrary, he imagines that the Knight of Faith will be one who dwells among the ordinary world of things, a "tax collector" he suggests in *Fear and Trembling*. One would not be able to see from the outside that this individual has faith, for faith, by virtue of its radical inwardness, is inexpressible. The entirety of the finite realm would be 'returned' to such an individual for the paradoxical reason that, through faith, he or she no longer fears the loss of what exists; in faith, the individual affirms the absurdity and arbitrariness by which the existing world comes into being and passes out again. That affirmation is not a kind of wisdom or knowledge, but an irrational passion that emerges at the limits of all thinking.

THE PARADOXICAL LANGUAGE OF FAITH

Although it is clear that Kierkegaard writes in favor of faith, there are at least two remaining questions that trouble any reader of his works. The first question concerns the 'what' of faith: in what does Kierkegaard have faith? What is this God which appears to be the infinite or, more specifically, infinite possibility? The second question is intimately related to the first: how could we have received an answer to the question 'in what does Kierkegaard have faith?' if we expect the answer to arrive *in language*? After all, we have already learned that faith cannot be expressed in language, that it is the infinite passion of the inwardness of the self. But what is the status of Kierkegaard's own texts, if we understand the purpose of these texts to be an incitement to faith? How do these texts work? How do they achieve their purpose, if from the start we know that they can never express faith or, if they claim to have expressed faith, they have failed in that very task?

Kierkegaard's God is in-finite which means that this God can never be identified with one of his products. This God is said to be the origin of the existing world, but this is not a God who, in a personified form, at some point in history—or prior to history—said 'Let there be light' and light suddenly there was. And it is not that Kierkegaard disputes the truth of the Bible, but he insists that the truth of the Bible is not to be found in the language of the text. In this sense, Kierkegaard is against a literal reading of the Bible, one which takes every word printed there to be the transmitted word of God. On the contrary, the 'truth' of the Bible is not, properly speaking, *in* the text, but is to be found *in the reader,* in the various acts by which the various injunctions to faith are *appropriated* and taken up by those who read the text. The truth of the Bible is to be found in the faith of those who read the Bible. The text is a *condition* by which a certain kind of instruction in faith takes place, but faith can never be achieved by learning what the Bible says, only by finally turning away from that text and turning inward to discover the infinite passion that emerges from the demand to affirm contingency. In *Philosophical Fragments,* the Bible and biblical scholarship are treated with irony: these texts can deliver no *historical* truth of interest to the person interested in faith, for no historical documentation regarding the existence or teachings of Jesus Christ can ever convince a person into faith. Faith does not arrive as the result of a persuasive argument; faith (along with its alternative, despair) is precisely what has the chance to emerge when all argumentation and historical proof fail.[15]

But there is a further difficulty with an historical approach to faith. Some Christian scholars argue that it can be proven that Jesus Christ lived,

that he came into the world, and that he was the son of God. The proof 'that' he existed is, however, not enough for Kierkegaard. That assertion simply prompts him to ask a series of philosophical questions which the historical enquiry cannot answer: what does it mean for anything to 'come into existence'? If something can be said to 'come into existence,' then at some early point in time, it did not exist at all. How, then, can something which is nonbeing become transformed into being? This is, of course, the question that preoccupied us above when we considered how philosophical wonder focuses on the apparent absurdity that some things exist rather than not, that certain possibilities become actual or finite, whereas other possibilities remain merely possible. Possibility and actuality are mutually exclusive states, that is, a thing is either possible or actual, but it would make no sense to say that it is both at once. Therefore, to say that a given thing has come into existence implies that it has moved from a state of possibility to one of actuality. This transition cannot be 'thought,' says Kierkegaard, but is a contradiction, one that accompanies all 'coming into being.'

In *Philosophical Fragments,* Kierkegaard considers the highly significant paradox that in the person of the Savior (whose historical status remains uncertain or, at least, irrelevant), it appears that what is Eternal has come into time, and that what is infinite has appeared in finite form. Whereas Hegel would claim that the finite appearance in this consequential instance expresses and actualizes the infinite, that this person in time, aging and mortal, expressed that which can never die; Kierkegaard takes issue with such a notion, arguing that this occurrence is utterly paradoxical, that the human and divine aspects of the figure of Christ can never be reconciled; insofar as he is infinite, he cannot appear in finite form, without losing his status as infinite; and insofar as he is finite, he cannot become infinite, for finitude implies mortality.

What is striking about Kierkegaard's writing in *Philosophical Fragments* is that the so-called miracle of God coming into existence recurs at every moment that some finite thing 'comes into being.' Christ is no exception to this paradoxical movement, but neither is he singular. After all, every human self emerges from a set of infinite possibilities and so moves from the infinite (which is nonbeing, that which is not yet finite and does not yet have a specified kind of being) to the finite (or being). Indeed, anything that comes into existence is miraculous for the very reasons we set out above in our discussion of wonder. In making this move, Kierkegaard appears to be taking an almost arrogant distance from the church authorities, the Scriptures, and the religious authorities whose task it is to settle historical details about Christ's sojourn on earth. Indeed, Kierkegaard goes so far as to subject the key concepts of Christianity to a

new set of definitions, ones that are devised by him. Kierkegaard is not interested in testing his interprerations against the Bible or against earlier interpretations; he devises and sets forth his own. Throughout the introductory chapter of *Philosophical Fragments,* Kierkegaard appears to take over the power to name that properly belonged to God in the book of Genesis. In Genesis, God spoke and said, 'Let there be…light, man, woman, beasts, etc.,' and the very power of his voice was sufficient to bring these entities into being. Kierkegaard appears to appropriate this power of naming for himself, but the entities he brings into existence through his writings are Christian concepts. As a result, he *names* these concepts and, in the naming, revises their meaning according to his own inter-pretive scheme: "What now shall we call such a Teacher, who restores the lost condition and gives the learner the Truth? Let us call him *Saviour*…let us call him *Redeemer*" (*PF,* 21). Further definitions are offered for "conversion," "repentance," "New Birth," and more (*PF,* 22–3).

What are we to make of this Kierkegaardian willingness to fabricate new meanings for the orthodox terms of Christianity? Is it not a kind of arrogance or pride to offer new interpretations for such words? By what right does Kierkegaard proceed with such obvious enthusiasm to create new meanings for old words? Is this creative way with words related to Kierkegaard's enigmatic career as an author?

What is the authority of the author? For Kierkegaard, faith cannot be communicated, so that any effort to write a book that communicates faith will, by definition, have to fail. In this way, then, Kierkegaard must write a book which constantly fails to communicate faith, a book which insistently renounces its own authority to state what faith is, a text which turns back upon itself and effectively wills its own failure. If the reader of his book knows that the book cannot offer knowledge of faith, then that reader will be seduced by the promise of that knowledge only to be disappointed in an instructive way. Kierkegaard's language must, then, perform the paradoxical task of enacting the limits of language itself. The author who wishes to point the way to faith must resist every effort to communicate faith directly; in other words, that author must will the failure of his own book, and in that very failure, know its success.

In *Sickness unto Death,* Kierkegaard considers the peculiar kind of despair that afflicts "poets" and makers of fiction. We can read in this diagnosis a thinly veiled autobiographical confession. Consider that Kierkegaard is a kind of poet,[16] one who produces a fictional narrator for most of his early texts through the construction of various pseudonyms. He then produces "examples" of faith and despair, fabricating "types" of individuals, embellishing on biblical and classical characters: Abraham, Don Juan, etc. And now consider Kierkegaard's diagnosis of the person

who suffers from defiant despair, the will to be oneself, that is, the will to be the sole ground and power of one's own existence and, therefore, to take the place of God:

> this is the self that a person in despair wills to be, severing the self from any relation to a power that has established it, or severing it from the idea that there is such a power…the self in despair wants to be master of itself or to create itself.
>
> (*SUD,* 68)

Kierkegaard then explains that this kind of despairing individual regularly fantasizes that he or she is all kinds of things that they are not: "the self in despair…constantly relates to itself only by way of imaginary constructions" (*SUD,* 68). This fiction-producing self can make itself into "an imaginatively constructed God," but this self is for that reason "always building castles in the sky…only shadowboxing" (*SUD,* 69). At an extreme, this defiant form of despair becomes *demonic* despair, and here the will to fabricate and fictionalize asserts itself in clear defiance, even hatred, of God. Is there, for Kierkegaard, a stark opposition between the life of faith and that of fiction-making? And can Kierkegaard himself give up his imaginary constructions in order to live the life of faith, one which we know, from the consideration of Abraham, is a life of silence?

Demonic despair, which Kierkegaard calls the most intensive form of despair, is rooted in "a hatred of existence": "not even in defiance or defiantly does it will to be itself, but for spite" (*SUD,* 69). And what evidence does such a person have against existence? The one in demonic despair is himself the evidence that justifies his hatred of existence. This appears to imply that the one in demonic despair, that incessant maker of fictions, *hates himself* for producing an imaginary construction of himself, but nevertheless persists in this self-fabrication. This is a self which, through fiction-making, postures as the creator of its own existence, thus denying the place of God as the true author of human existence. But this demonic self must also despise itself for trying to take over the power of God. This self in demonic despair alternates between self-fabrication and self-hatred. Inasmuch as this demonic one is an author, and is Kierkegaard himself, he produces a fiction only then to tear down the construction he has just made. The one in demonic despair can acknowledge the divine authorship that enables his own fiction, his pseudonymous work, only by admitting that what he has produced is a necessary fraud.

At the end of Part One of *Sickness unto Death,* Kierkegaard appears to begin this disavowal of his own production, clearing the way for an

appreciation of God as the only 'first-rate author' in town, acknowledging that Kierkegaard's own work must always be under-stood as derived from the power that constitutes him, a power that precedes and enables his own imaginary production:

> Figuratively speaking, it is as if an error slipped into an author's writing and the error became conscious of itself as an error—perhaps it actually was not a mistake but in a much higher sense an essential part of the whole production—and now this error wants to mutiny against the author, out of hatred toward him, forbidding him to correct it and in maniacal defiance saying to him: No, I refuse to be erased; I will stand as a witness against you, a witness that you are a second-rate author.
>
> (*SUD,* 74)

Written thus in 1848 and published in 1849, we can see here the fruition of Kierkegaard's intention to resist the seduction of authorship. Two years earlier, he wrote in his journal: "My idea is to give up being an author (which I can only be altogether or not at all) and prepare myself to be a pastor."[17] It appears that Kierkegaard gave up his career as a literary and philosophical author after *Sickness unto Death,* and persevered in writing purely religious tracts. Had he achieved faith? Did he overcome despair? Was his writing as compelling after the leap or did it turn out to require the very despair he sought to overcome?

NOTES

1 It would be interesting to compare this claim with Freud's efforts to address the question of 'anxiety' through analysis.

4 "In order to avoid confusion, it is at once necessary to recall that our treatment of the problem does not raise the question of the truth of Christianity. It merely deals with the problem of the individual's relationship to Christianity. It has nothing whatever to do with the systematic zeal of the personally indifferent individual to arrange the truths of Christianity in paragraphs; it deals with the concern of the infinitely interested individual for his own relationship to such a doctrine." Ibid., p. 18.
5 Descartes, Fifth Meditation. God is perfect and can only make that which is equally perfect or less perfect than him-/her-/itself, for nothing can be more perfect than God. If there is something which has some degree of perfection in it, that thing must be produced by that which is at least as perfect or more

perfect than the thing itself. There is nothing in the world that is more perfect than human beings even though human beings are imperfect in some ways (they sin, they are ignorant). This implies that human beings must be created by that which is equally or more perfect than themselves. And it is perfect being that is called God.

10 See Kierkegaard's discussion of the limits of speculative thought in *CUP,* ch. 2, "The speculative point of view."

11 This is a view which is falsely attributed to existential philosophy generally, but which we can see ought not to be ascribed to Kierkegaard.

12 It is interesting to note that Kierkegaard takes the phrase "fear and trembling" from the New Testament, Philippians 2:12–14, but applies it to an Old Testament figure, Abraham. Hegel's placement of "fear and trembling" in relation to work is perhaps slightly closer to the meaning of the New Testament use: "Wherefore, my beloved, as ye have always obeyed, not as in my presence only, but now much more in my absence, work out your own salvation with fear and trembling: For it is God which worketh in you both to will and to do of his good pleasure." *The Dartmouth Bible,* ed. R.B.Chamberlin and H. Feldman (Boston: Houghton Mifflin, 1961).

13 PS: Hegel, *The Phenomenology of Spirit,* trans. A.V.Miller (New York: Oxford University Press, 1977).

14 Imagine if Hegel's bondsman were to have created a son with a woman, and that he was then compelled to sacrifice that son, how would Hegel's analysis have to change in order to take account of Abraham's anguish?

15 Note Kierkegaard's ironic tone in his writing against the historical efforts to supply a proof of God's existence: "And how does the God's existence emerge from the proof? Does it follow straightway, without any breach of continuity?...As long as I keep my hold on the proof, i.e. continue to demonstrate, the existence does not come out, if for no other reason than that I am engaged in proving it; but when I let the proof go, the existence is there. But this act of letting go is surely also something; it is indeed a contribution of mine. Must not this also be taken into account, this little moment, brief as it may be—it need not be long, for it is a *leap*. However brief this moment, if only an instantaneous now, this 'now' must be included in the reckoning." *PF,* p. 53.

Kierkegaard here plays on the double meaning of the act of letting go being "a contribution of mine." On the one hand, this is his philosophical contribution to the critique of rationalism, and "the leap" is a concept he introduced into philosophical and religious discourse. On the other hand, he is suggesting that no person, including himself, can arrive at faith without making a contribution of him- or herself. And this contribution, being one of passion, has to come from the inwardness of the self, and be directed toward a faith which no 'proof can automatically produce.

Glossary

***a priori*—**In the early eighteenth century, knowledge was called *a priori* if it was acquired by reason, not observation, or by deduction, not induction. Opposite: *a posteriori*. Kant introduced a new meaning, described under "*a priori* knowledge."

***a priori* knowledge—**what can be known independently of any (particular) experience.

Absolute—the complete, all-encompassing whole of reality. In Hegel's philosophy, the term refers to knowable reality.

absolute idealism—the metaphysical position that mind and reality share the same categorical structure, and thus that understanding the nature and fundamental structures of thought is the same enterprise as understanding the nature and fundamental structures of the world. To be distinguished from epistemological idealisms of any kind.

absolute knowledge—unbiased, undistorted knowledge, without inconsistencies. In Hegel's philosophy, this term does not refer to knowing every detail, but to having an adequate understanding of knowlege and the Absolute, and to recognizing that knowledge and the Absolute are not epistemologically separate.

abstract—in Hegel's philosophy, that which is empty and devoid of content. Abstract knowledge focuses on certain aspects of a thing at the expense of other aspects and the thing's context.

acquired character—in Schopenhauer's philosophy, the gradually accumulated knowlege of what one wills and of one's abilities. Such knowledge has transformative impact on behavior, for it provides new motives to the individual's will.

analytic judgment—a judgment or assertion the predicate of which is implicit in the concept of the subject. Example: a bachelor is an unmarried man.

***ars charactenstica*—**a form of symbolic logic invented by Leibniz, in which numbers replace concepts of things, and combinatorial arithmetic is applied to the numbers. Leibniz believed that in this way a universal language could be established.

atheism controversy *(Atheismusstreit)*—a famous public dispute over the relationship

between philosophy and religion, provoked by Fichte's assertion that what is truly divine is the moral world order itself and that there is no need to posit a "moral law-giver" or personal God as the creator of this moral order.

Aufbeben, Aufhebung—a German word variously translated as "to supersede," "to sublate," "to sublimate," or, more colloquially, "to pick something up." In Hegel's *Phenomenology of Spirit,* the term is used to refer to history moving forward while preserving what has come before. The term also implies improvement, so that the original is "lifted" into something better.

autonomy (positive freedom)—the ability to determine for oneself the principles in accord with which one determines one's will.

principle of autonomy—the categorical imperative.

check *(Anstoß)*—in Fichte's philosophy, the name for the inexplicable thwarting of the outwardly directed, practical activity of the I, in consequence of which one becomes conscious of a "feeling."

cogito—"I think," supposed by Descartes to be a sort of direct intuition of self, by Kant to express the unity of apperception.

compassion—according to Schopenhauer, the orientation that proceeds from the recognition that all beings are manifestations of the same will. A person who fully recognizes this no longer feels any inclination to assert his or her will against those of others and is, accordingly, a saint.

concept—an objective, though often implicit, humanly graspable ideal unity of a "many-ness." A prescriptive ideal that is part of a system of such ideals that the world is striving to realize and in terms of which what happens in the world can be made sense of.

concrete—in Hegel's philosophy, the whole, the thing-in-itself. Knowledge of an entity is concrete to the extent that it comprehends the entity in its entirety.

concrete universal—See "concept."

Critical philosophy, the—another name for transcendental idealism or Kantianism.

dialectic—development through apparently contradictory sequential stages. In Hegel's philosophy, this is the way in which the human Spirit has evolved through history. It is the means by which human beings attain an adequate conception of the world, drawing and carrying forward the conclusions of various conceptions of the world characteristic of the stages sequentially achieved through history.

dogmatism—Fichte's name for philosophical realism, understood as an attempt to derive consciousness from things in themselves.

duty—how one ought to act.

perfect duty—a duty with which one's every act ought to accord.

imperfect duty—a duty with which one ought to adopt a principle of acting in accord, but for which the individual has latitude in deciding exactly when the principle ought be acted upon.

ethical duty—all of one's duties comprehended as ways that one ought to act exactly because they are duties, i.e. because they follow from the categorical imperative. The only incentive for acting in accord with one's duties, so comprehended, is. the internal incentive that follows merely from the recognition that they are duties.

juridical duty—those duties that one can be coerced to fulfill through external incentives.

elementary philosophy—the name given by K.L.Reinhold to his own systematic revision of Kantianism.

empirical character—the individual's character as it appears phenomenally.

end of nature—nature's purpose. **ultimate end of nature**—the most comprehensive purpose that can be realized within nature and in accord with its laws. Kant thinks that this is human culture, by which he means the development of aptitude of human beings to accomplish their chosen ends. **final end of nature**—that purpose for which the entire system of nature functions as an enabling condition, but which cannot be realized within nature. Kant thinks that this is the development of humanity toward moral perfection.

entelechy—an Aristotelian conception concerned with completion. Entelechy is a thing's actuality when it is fully complete, no longer possessing any potentiality. Entelechy is also the directing agent of a thing's natural activity toward the fulfillment of its natural end.

extended—spatial, as in "bodies are extended."

extension—space.

extra mentem—existing outside (independent) of the mind.

faculty—an ability of the mind; for example, "Human beings have an imaginative ability, or faculty."

form of consciousness ***(Gestalt des Bewusstseins)***—a self-sufficient conceptual framework. In Hegel's philosophy, a stage of the human Spirit's development.

freedom positive—See "autonomy." **negative**—independence from determination through the laws of nature. **internal**—freedom with respect to the determination of one's will. **external**—freedom with respect to one's ability to effectuate one's will, especially thought of as independence from constraints that come from the will of other rational beings. **innate right to external freedom**—the right that all rational beings have, by virtue of their nature as rational being, to so much external freedom as is compatible with the same for others.

genius—in Schopenhauer's philosophy, an exceptional talent for heightened perception (specifically aesthetic experience) and for communicating this state to others.

Grundbegriff—a simple concept which admits no further analysis. For example: substance, cause.

historical materialism—From 1845 Marx developed the view that the driving force of history was the growth of the productive forces at the disposal of humans and the productive relations into which humans entered. This "economic base," he maintains, "shapes" other aspects of society such as the state and our forms of consciousness. Such a theory of history Marx called "materialist" in opposition to other theories, called "idealist" or "ideological," in which the economic base either was ignored or played hardly any role.

Identity Philosophy (or "System of Identity")—Schelling's name for a system which embraces both transcendental idealism and speculative *Naturphilosophie* and

is based upon the idea of "the Absolute," understood as sheer identity, that is, as the undifferentiated unity of the ideal and the real (also called "objective idealism" or "absolute idealism").

imperative—the formula that expresses a command that constrains the will of a rational being whose will is influenced by both pure reason and material incentives. **hypothetical imperative**—presents an action as the necessary means to some particular end. **categorical imperative**—presents an action as of itself necessary, without regard to any other end. Kant thinks that the categorical imperative is best formulated as "Act only according to that maxim by which you can at the same time will that it become a universal law."

indifference, point of—the first principle or starting point of Schelling's Identity Philosophy; another name for "the Absolute."

intellectual intuition—(a) in Kant, the name for a nonexistent faculty of knowledge, through which one would have direct experience of an object; (b) for Fichte, another name for the original self-positing (or *Tathandlung*) of the I, an act within which the I as an object is directly present to itself as a subject; (c) for Schelling, a higher faculty of direct, nonsensible knowledge of reality, hence a special "faculty of truth" employed by artists and philosophers.

intelligible character—the individual's character as it is, outside time and space. In Schopenhauer's philosophy, the intelligible character is akin to a Platonic Idea for the individual.

justice—the aggregate of those conditions in which everyone's will is completely compatible in accordance with universal law. The condition of justice is identical to the universal realization of the innate right to external freedom.

leap of faith—the nondialectical act of will by which an individual leaves his or her previous stage of experience and achieves the highest stage possible for human beings, the stage of religious faith.

maxim—the general principle according to which an individual acts (e.g. "When I'm hungry, I'll eat").

meta-language—a language used to discuss a language. A meta-language is often a theoretical language. The language being discussed through a meta-language is called, by contrast, "the object language."

moment—a partial but essential aspect, a stage.

monad—in Leibniz's philosophy, a simple spiritual substance whose activities are representation and appetition.

monadology—Leibniz's theory that the world consists of monads.

natural right *(Naturrecht)* or theory of right *(Rechstslehre)*—that portion of Fichte's *Wissenschaftslehre* which examines the ways in which individual freedom must be limited in consequence of (and, at the same time, as a condition of) the recognition of the freedom of the others. The "theory of right" is equivalent to social and political philosophy and is, according to Fichte, entirely independent of ethics.

***Naturphilosophie* ("philosophy of nature")**—Schelling's name for that branch of philosophy which interprets nature as a single, hierarchically organized, and self-developing whole, and thus, not as the opposite, but rather as the

complement or "analogon" of the realm of spirit and consciousness; whereas transcendental idealism proceeds from subjectivity to objectivity, Schelling's philosophy of nature begins with objectivity and proceeds toward subjectivity.

negative philosophy—the name by which Schelling, during his final period, designated the transcendental philosophy of Kant and Fichte, as well as his own earlier philosophy.

nominalism—the position that words do not refer to the essences of things (for essences do not exist); instead, they are simply names that we assign to things. On this view, abstractions are all fictions (albeit useful ones). Only particular things exist.

odium theologicum—a special kind of hatred sometimes said to be characteristic of theologians who do not agree.

ontology—the division of metaphysics which deals with the most necessary and universal concepts of being, like Aristotle's enquiry into "being as being." Also called "first philosophy" and "general metaphysics."

pantheism—the doctrine that the world (i.e. the physical universe) is God or a mode of God's being. A Christian heresy which, in the eighteenth century, was usually ascribed to Spinoza.

particular—an entity that is definite and locatable with space and time. This term may refer to an individual person, as well as a thing.

Platonic Ideas—Plato's Forms. In Schopenhauer's philosophy, Platonic Ideas are grades of the will's objectivity. The universal prototypes of phenomenal objects accounting for natural kinds. As the universal forms that are instantiated in particulars, Platonic Ideas are the objects beheld in aesthetic experience.

positive philosophy—Schelling's name for the philosophy of revelation and mythology which he developed during his final period, a philosophy which, he believed, was genuinely capable of dealing with the mystery of existence.

powers, or potencies *(Potenzen)*—Schelling's term for the various levels of systematic organization exhibited within nature, as well as for the various levels of expression of the indifferent absolute.

practical philosophy—that division of transcendental idealism which is concerned with freedom and the will, and hence with "what ought to be" rather than with "what is."

practical philosophy, primacy of—For Fichte, this Kantian maxim implies that theoretical cognition must be grounded in willing and that freedom is thus a determining principle of all experience.

practical reason—reason employed with respect to action, i.e. with respect to bringing about conditions in the world.

pre-established harmony—In Leibniz's philosophy, the apparent causal connections between changes in different monads is denied, and it is asserted that these changes are pre-established (by God) so as to make a harmonious whole.

principium individuationis—principle of individuation. In Schopenhauer's philosophy, the *principium individuationis* is equivalent to time and space, the essential forms through which individuation becomes apparent in the phenomenal world.

pure will-less subject of knowledge—the condition of the individual during aesthetic experience, according to Schopenhauer. The individual becomes, as it were, the universal subject, contemplating the universal forms (or Platonic Ideas) evident in the object observed.

rationalism—a philosophical orientation which considered *A priori* reason capable of ascertaining significant truths about the world, and which considered natural science to be primarily a rational, deductive system only secondarily concerned with sense experience. In this sense, Kant is a rationalist. However, the term is principally associated with Descartes, Spinoza, and Leibniz, who are known as "the Rationalists." Rationalism is frequently contrasted with empiricism, which takes sense perception to be the fundamental basis for knowledge.

reductio ad absurdum—a mode of argument in which one shows that a thesis held by one's opponent, however reasonable it may seem to be, implies an absurdity and is therefore itself absurd.

repentance—According to Schopenhauer, repentance amounts to change of knowledge (and consequently motive), with the result that behavior is transformed.

resignation—in Schopenhauer's philosophy, the renunciation of the will that is characteristic of the saint. This renunciation results from full recognition that the entire phenomenal world, and every object in it, is a manifestation of a single will. In Kierkegaard's philosophy, the condition of being reconciled to tragedy in one's situation, without yet being capable of faith. The person in this condition is Kierkegaard's "Knight of Infinite Resignation," in contrast to the "Knight of Faith."

right in oneself—the right to have others not exercise any control over one's body, i.e. to not be assaulted in any manner.

rightful possession—possession that is consistent with justice.

semantics—the interpretation of a symbolic system.

***Sittenlebre* (“theory of ethics”)**—The specifically "practical" portion of Fichte's *Wissenschaftslehre,* the "theory of ethics" provides an account of both the form and the content of the highest principle of morality (the categorical imperative) and derives specific duties from one's general obligation to posit one's own freedom.

social contract theory—the theory that people are subject to political obligations because they have contracted with others to subject themselves to such obligations (presumably because of some benefit that they thereby expect to receive).

solipsism—the theory that "I alone exist." This theory has probably never been held by a sane philosopher, but it is conceptually interesting as a *reductio ad absurdum* of some forms of idealism.

speculative—In the eighteenth century, "speculative" often meant "theoretical." Thus "speculative philosophy" did not mean speculative in the sense of fanciful dreaming, but theoretical as opposed to practical (moral) philosophy.

Spirit *(Geist)*—the subject in a universal sense. In Hegel's philosophy, the Spirit includes every individual and every object of human experience. It amounts

to the human world, conceived as self-conscious and a comprehensible unity.

stages—in Kierkegaard's philosophy, a particular orientation or lifestyle that characterizes an individual's pursuits. Kierkegaard describes three distinct stages: the aesthetic, the ethical, and the religious stage. These stages do not automatically or dialectically give way to one another. Instead, an individual must "leap" from one to another by means of an inner response to his or her situation. Such a move is usually precipitated by the individual's recognition that he or she is in despair.

sufficient reason, principle of—the principle that there is a sufficient reason (or cause) of everything that exists or happens. According to Schopenhauer, this principle applies only to phenomenal objects. Each such object stands in a necessary, mutually determining relationship to all other phenomenal objects.

summons ***(Auffordentng)***—in Fichte's *Wissenschaftslehre*, the term designating one's inner awareness of the freedom of others, as a consequence of which one is called upon to limit one's own freedom.

syntax—a purely formal specification of the legal strings of a symbolic system.

synthetic judgment—a judgment or assertion which is not analytic.

system—an interconnected set of propositions, demonstrably related. In the eighteenth century, the term referred to a deductive system, a set of first principles and theorems deducible from them.

Tatbandlung **("fact/act" or more literally, "deed/act")**—a term coined by Fichte to designate the original, self-positing act of the I, an act which is postulated by the philosopher as underlying the experienced separation between the subject and object of consciousness.

teleological suspension of the ethical—in Kierkegaard's philosophy, a condition in which die ethical law, which is universally applicable to human individuals, is suspended in a particular individual's case because that person's religious vocation places more specific demands upon him or her.

theoretical philosophy—that branch of transcendental idealism which accounts for human cognition, that is, for our experience of "representations accompanied by a feeling of necessity."

transcendent, transcendental—These words were used loosely in the eighteenth century before Kant to refer to metaphysical concepts common to all the branches of special metaphysics. For example, "Cause is a transcendent concept." Kant gave specific technical meanings to these words. (See "transcendental argument.")

transcendental argument—according to Kant, an argument in support of one claim, because the truth of this claim can be shown to be a necessary condition of the truth of another claim that is (necessarily) recognized as true.

transcendental unity of apperception—Kant's principle that, necessarily, any conscious state must be so unified with the other states of that consciousness as to make it possibly self-conscious.

transformative method (also called "the inversion principle")—Feuerbach proposed that God was merely a projection of idealized human qualities onto the world in the form of an allegedly independently existing being who

is then believed to have the power to create us. As a consequence of this, Feuerbach proposed to trace all our talk of God back to some human quality or qualities. We may say that God is a "reification" of idealized human qualities. Marx adopted Feuerbach's method in political theory to criticize Hegel's reification of features of the state and society above the human relations of production. He transforms the Hegelian reifications into more concrete talk of humans and their productive relations.

universal—what is nonparticular, not specifically located in time and space, and logically accessible to every individual. In Hegel's philosophy, Spirit is universal; it includes all possible particulars, including every individual human being.

veil of Maya—the Vedantic "veil of illusion," a term that Schopenhauer appropriates as descriptive of the phenomenal world.

will—(according to Schopenhauer) the thing-in-itself, the reality that underlies phenomenal appearances.

***Wissenschaftslehre* (literally "theory of science" or "doctrine of scientific knowledge")—**Fichte's name for his entire system of philosophy; not to be confused with any particular book or presentation of this system, and, especially, not to be confused with the presentation of the mere "foundations" of this system (as presented, for example, in *The Foundations of the Entire Wissenschaftslehre*).

world as representation—(for Schopenhauer) the world as it appears as a consequence of the forms imposed by our minds; the phenomenal world.

world as will—(for Schopenhauer) the world as it is in itself; the noumenal world.

Routledge History of Philosophy Volume VII

The nineteenth century was a period of intense intellectual activity with advances being made in the sciences, in mathematics and in psychology which gradually established itself as a discipline independent of philosophy. Philosophical disputes arose about the nature of scientific method and about whether, or to what extent, the understanding of human conduct and human society required the adoption of the methods of observation and experiment common to the natural sciences. Different philosophical theories about the nature of reality, the foundations of knowledge and of morality, and the limits of individual freedom were systematically developed, and many such theories are still very much alive in contemporary philosophical debates.

The philosophers discussed in this volume include those belonging both to the 'analytic' and the 'continental' traditions, as well as the now influential American pragmatists. Each chapter is written by a different author who presents the issues in the context of the period in which they arose, while also keeping an eye on their relevance to current philosophical interests. A few philosophers are discussed in more than one chapter, in different but mutually illuminating contexts.

Each chapter in *The Nineteenth Century* is self-contained and makes a distinctive contribution to a set of philosophical problems. This volume provides a broad, scholarly introduction to nineteenth-century philosophy. It also contains a glossary of philosophical terms and a chronological table of philosophical and cultural events.

C**.L.Ten** is Visiting Professor of Philosophy at the National University of Singapore and holds a Personal Chair in Philosophy at Monash University, Australia. He has published widely on nineteenth-century philosophy and is a Fellow of the Australian Academy of the Humanities.

Routledge History of Philosophy

General Editors—G.H.R.Parkinson and S.G.Shanker

The *Routledge History of Philosophy* provides a chronological survey of the history of Western philosophy, from its beginnings in the sixth century BC to the present time. It discusses all major philosophical developments in depth. Most space is allocated to those individuals who, by common consent, are regarded as great philosophers. But lesser figures have not been neglected, and together the ten volumes of the *History* include basic and critical information about every significant philosopher of the past and present. These philosophers are clearly situated within the cultural and, in particular, the scientific context of their time.

The *History* is intended not only for the specialist, but also for the student and the general reader. Each chapter is by an acknowledged authority in the field. The chapters are written in an accessible style and a glossary of technical terms is provided in each volume.

I *From the Beginnings to Plato*
C.C.W.Taylor

II *Hellenistic and Early Medieval Philosophy*
David Furley

III *Medieval Philosophy*
John Marenbon

IV *The Renaissance and C17 Restoration*

General editors' preface

The history of philosophy, as its name implies, represents a union of two very different disciplines, each of which imposes severe constraints upon the other. As an exercise in the history of ideas, it demands that one acquire a 'period eye': a thorough understanding of how the thinkers whom it studies viewed the problems which they sought to resolve, the conceptual frameworks in which they addressed these issues, their assumptions and objectives, their blind spots and miscues. But as an exercise in philosophy, we are engaged in much more than simply a descriptive task. There is a crucial critical aspect to our efforts: we are looking for the cogency as much as the development of an argument, for its bearing on questions which continue to preoccupy us as much as the impact which it may have had on the evolution of philosophical thought.

The history of philosophy thus requires a delicate balancing act from its practitioners. We read these writings with the full benefit of historical hindsight. We can see why the minor contributions remained minor and where the grand systems broke down: sometimes as a result of internal pressures, sometimes because of a failure to overcome an insuperable obstacle, sometimes because of a dramatic technological or sociological change, and, quite often, because of nothing more than a shift in intellectual fashion or interests. Yet, because of our continuing philosophical concern with many of the same problems, we cannot afford to look dispassionately at these works. We want to know what lessons are to be learned from the inconsequential or the glorious failures; many times we want to plead for a contemporary relevance in the overlooked theory or to consider whether the 'glorious failure' was indeed such or simply ahead of its time: perhaps even ahead of its author.

We find ourselves, therefore, much like the mythical 'radical translator' who has so fascinated modern philosophers, trying to understand an author's ideas in their and their culture's eyes, and, at the same time, in our own. It can be a formidable task. Many times we fail in the historical undertaking because our philosophical interests are so strong, or lose sight of the latter because we are so enthralled by the former. But the nature of philosophy is such that we are compelled to master both techniques. For learning about the history of philosophy is not just a challenging and engaging pastime: it is an essential element in learning about the nature of philosophy—in grasping how philosophy is intimately connected with and yet distinct from both history and science.

The *Routledge History of Philosophy* provides a chronological survey of the history of western philosophy, from its beginnings up to the present time. Its aim is to discuss all major philosophical developments in depth, and, with this in mind, most space has been allocated to those individuals who, by common consent, are regarded as great philosophers. But lesser figures have not been neglected, and it is hoped that the reader will be able to find, in the ten volumes of the *History*, at least basic information about any significant philosopher of the past or present.

Philosophical thinking does not occur in isolation from other human activities, and this

History tries to situate philosophers within the cultural, and in particular the scientific, context of their time. Some philosophers, indeed, would regard philosophy as merely ancillary to the natural sciences; but even if this view is rejected, it can hardly be denied that the sciences have had a great influence on what is now regarded as philosophy, and it is important that this influence should be set forth clearly. Not that these volumes are intended to provide a mere record of the factors that influenced philosophical thinking; philosophy is a discipline with its own standards of argument, and the presentation of the ways in which these arguments have developed is the main concern of this *History*.

In speaking of 'what is now regarded as philosophy', we may have given the impression that there now exists a single view of what philosophy is. This is certainly not the case; on the contrary, there exist serious differences of opinion, among those who call themselves philosophers, about the nature of their subject. These differences are reflected in the existence at the present time of two main schools of thought, usually described as 'analytic' and 'continental' philosophy. It is not our intention, as general editors of this *History,* to take sides in this dispute. Our attitude is one of tolerance, and our hope is that these volumes will contribute to an understanding of how philosophers have reached the positions which they now occupy.

One final comment. Philosophy has long been a highly technical subject, with its own specialized vocabulary. This *History* is intended not only for the specialist but also for the general reader. To this end, we have tried to ensure that each chapter is written in an accessible style; and since technicalities are unavoidable, a glossary of technical terms is provided in each volume. In this way these volumes will, we hope, contribute to a wider understanding of a subject which is of the highest importance to all thinking people.

Notes on contributors

Robert Brown has been a member of the History of Ideas Unit of the Australian National University since 1973, is a former editor of the *Australasian Journal of Philosophy*, and has published extensively in philosophical journals and collections. Recently he has contributed a chapter to Blackwell's *A Companion to Contemporary Political Philosophy* (1993) and edited *Classical Political Theories, Plato to Marx* (1990).

C.A.J.Coady is Boyce Gibson Professor of Philosophy and Director of the Centre for Philosophy and Public Issues at the University of Melbourne, Australia. He has numerous academic publications, including his book, *Testimony: a Philosophical Inquiry*. He has an abiding interest in ethical and conceptual problems to do with war and other forms of political violence.

Gerald F.Gaus is Professor of Philosophy and Political Science at the University of Minnesota, Duluth, USA. He was formerly Research Fellow in Philosophy in the Research School of Social Sciences of the Australian National University, and has been Visiting Research Fellow at the University of New England and Visiting Scholar at the Social Philosophy and Policy Center, Bowling Green State University. He is the author of *The Modern Liberal Theory of Man* (1983) and *Value and Justification* (1990). With Stanley Benn, he edited *Public and Private in Social Life* (1983). His latest book is entitled *Justificatory Liberalism*.

Jagdish Hattiangadi is Professor and Chair, Department of Philosophy, and Professor, Division of Natural Science, York University, Toronto, Ontario, Canada. His degrees are B.A. (Bombay 1962), M.A. (L.S.E. 1965), Ph.D. (Princeton 1970). He is the author of *How is Language Possible*? (1987) and numerous journal articles in philosophy and in the history of ideas.

Struan Jacobs lectures in science studies and history of ideas at Deakin University. He has a Ph.D. from the L.S.E., and is the author of *Science and British Liberalism*, and of articles that have appeared in such journals as *History of Philosophy*, *Canadian Journal of Philosophy*, and *Philosophy of Social Sciences*. His interest in nineteenth-century English thought includes, besides Whewell, Herschel, Whately, and Mill.

R.F.Khan has lectured in philosophy at the University of Singapore and, since 1965, at Monash University, Melbourne, Australia. His main interests are in moral and political philosophy, aesthetics, philosophy of religion and existentialism, and he has published papers in these subjects.

Michael Lessnoff is Reader in Politics in the University of Glasgow, Scotland. He is the author of books on *The Structure of Social Sciences* and *Social Contract*, and of numerous articles on political theory and the philosophy of social science. He has recently completed a book on Max Weber entitled *The Spirit of Capitalism and the Protestant Ethic.*

Cheryl Misak is Associate Professor of Philosophy at Erindale College, University of

Toronto, Canada. She is the author of *Truth and the End of Inquiry: a Peircean Account of Truth* and is presently working on a book on verificationism and one on pragmatism and morality.

Edward S.Reed is Associate Professor of Psychology at Franklin & Marshall College, Philadelphia. USA, where he also directs the Interdisciplinary Study of Mind Program. His historical and philosophical studies of psychology have been widely published, including his *James, Gibson and the Psychology of Perception* (Yale University Press, 1989). He is also actively engaged in empirical research on the organization of everyday activities, and is an Associate Editor of the journal *Ecological Psychology*. Dr Reed has been the recipient of fellowships from the (U.S.) National Endowment for the Humanities, the National Science Foundation, and the National Institute on Disability and Rehabilitation Research. He is at present completing a book *Ecologizing Psychology* to be published by Oxford University Press.

John Skorupski studied philosophy and economics at Cambridge University. After lecturing at the University of Glasgow he moved to the Chair of Philosophy at Sheffield University in 1984, and to the Chair of Moral Philosophy at Saint Andrews, Scotland, in 1990. He is the author of *Symbol and Theory* (1975), *John Stuart Mill* (1989), *English-Language Philosophy 1750–1945* (1993).

Robin Small was born in New Zealand, and gained degrees in physics and philosophy at the University of Canterbury, before completing a doctorate at the Australian National University. He is now senior lecturer in philosophy of education at Monash University. His research has been largely in the philosophy of education and the history of ideas.

T.L.S.Sprigge, British philosopher, teaches philosophy as an Endowment Fellow at the University of Edinburgh, Scotland, having taken early retirement from the chair of Logic and Metaphysics. His books include *The Rational Foundations of Ethics* (1987) *And James and Bradley: American Truth and British Reality* (1993). His present research is mainly toward a book on human and animal thought.

John Stillwell was educated at the University of Melbourne and M.I.T. Since 1970 he has been a member of the Mathematics Department at Monash University, Melbourne, Australia, and has written several books, the best known of which is *Mathematics and Its History* (Springer-Verlag 1989).

J.E.Tiles is Professor of Philosophy at the University of Hawaii at Manoa. He is the author of *Dewey* (1988) and *Things that Happen* (1981) and the co-author with Mary Tiles of *An Introduction to Historical Epistemology* (1992).

G.L.Williams lectures in politics at the University of Sheffield. His published work has concentrated mainly on J.S.Mill and the political thought of the nineteenth century. He is the author of *Political Theory in Retrospect* (1991) and is the editor of the Everyman edition of J.S. Mill, *Utilitarianism, On Liberty, Representative Government* (1993).

Introduction

C.L.Ten

This volume covers most of the major philosophers of the nineteenth century. The most conspicuous exceptions such as Hegel, Marx, Schopenhauer and Kierkegaard, are included in other, more thematically focused volumes. Of the philosophers considered in this volume, the figure of John Stuart Mill looms large. He made contributions to a wide area of philosophy, although he is best known today for his defence of individual liberty and for his much-maligned attempt to 'prove' the utilitarian principle. The roots of his ethics are to be found in the writings of his father, James Mill, and Jeremy Bentham. None of these was a professional philosopher, unlike many other philosophers of the century. The Mills worked for the East India Company, while Bentham was a man of independent means.

James Mill and Bentham were very concerned with practical issues of changing established social, political and legal institutions, exposing and rooting out the 'sinister interests' behind them. Bentham paid careful attention to language and especially to the language of law. Sinister interests flourish where unclear terms are used. We can make social progress only by trying first to translate the sentences in which these terms occur into equivalent sentences in which the vague terms are replaced by terms referring to entities that are real and perceptible by the senses. We can then be purged of those fictitious entities which cannot in this manner be replaced by real entities. Pleasure and pain are real entities which explain human motivation and also set the end of promoting the greatest happiness which all conduct should aim at. This standard of what we ought to do is the famous principle of utility.

Laws and constitutional arrangements should be framed in accordance with the principle. Bentham and James Mill supported democracy as the system of government that will ensure that the power of the rulers is not abused. But although they argued for the extension of the franchise, James Mill explicitly excluded women from the vote on the ground that their interests would be adequately protected by others. It was left to his son to promote the cause of women in his *The Subjection of Women*.

John Stuart Mill took up many of the concerns of James Mill and Bentham, but there was a distinct shift of emphasis in the way in which he argued for similar causes. The case for representative democracy was presented not just in terms of protecting the interests of the people but also, and perhaps more importantly, as providing the basis for their moral, intellectual and social development through participation in the political process. John Stuart Mill also changed the conception of utility, distinguishing between higher and lower pleasures, and emphasizing the importance of free and active choices between different ways of life. He argued passionately in his essay *On Liberty* for freedom of discussion and for individual liberty to perform acts not harmful to others even though the views expressed, or the acts in question, were those towards which the

majority felt repugnance.

Utilitarian theory was developed further by Sidgwick, a professional philosopher in Cambridge. He regarded common-sense morality as a system of rules which tended to promote general happiness. But utilitarianism would systematize and sort out some of the inconsistencies in common-sense morality and give it a rational foundation. Sidgwick recognized a paradox in that the utilitarian goal of promoting happiness may be better served if only a few enlightened people accept utilitarianism. If 'the vulgar' are told the truth that utilitarianism is the ultimate basis for their conduct, then they are likely to produce bad results as they miscalculate the consequences of their actions in an uncertain world. Sidgwick also acknowledged that the utilitarian principle is not the only principle that it is rational to comply with; it is also rational to act on the principle of egoism.

John Stuart Mill developed what he regarded as a refined version of an alternative to intuitionist moral theory in which moral truths are self-evident and known by intuition. One of the targets of Mill's attack was William Whewell. Mill in turn was attacked by the idealist philosophers. Bradley poured scorn on Mill's alleged attempt to show that each person desires the general happiness from the fact that each desires his or her own happiness. Bradley propounded a morality of self-realization to replace the goal of maximizing pleasure, whether it be one's own or the pleasures of all. The two other prominent British idealist philosophers were T.H.Green and Bernard Bosanquet, whose contributions to moral and political philosophy involve the working out of the view that the criterion of reality is coherence. A person's good is identified with the development and integration of his or her capacities into a coherent whole. Social life is necessary for individual perfection, and an account of the common good is developed whichinvolves the harmonious integration of complementary social roles. The sharp and frequent conflicts between the individual good and the social good are absent from this account.

On the continent Nietzsche presented a radical challenge to traditional morality. Declaring 'the death of God', he saw this as undermining the foundations of Christian morality. He distinguished between the 'master morality' of a ruling group and the 'slave morality' of the weak. 'Good' is a term that the ruling group use to refer to themselves and their conduct, and what is common is decreed 'bad'. But the weak have different values, and strength is regarded as 'evil'.

The moral theories of philosophers like John Stuart Mill and Bradley were integrated with their more general philosophical views. Three major types of philosophy were prominent during this period—the empiricism of Mill, the idealism of Bradley and the pragmatism of the American philosophers Peirce and William James.

Major advances were made in mathematics. For example, in the earlier part of the century there were challenges to Euclidean geometry, while the latter part saw Frege's contributions to the understanding of the foundations of mathematics. Similarly, significant scientific discoveries were made, and there was much interest in scientific method, as reflected for example in the dispute between Mill and Whewell on induction and the role of hypothesis in scientific enquiry. Whether, or to what extent, the understanding of human conduct and human society required the adoption of the methods of observation and experiment common to the natural sciences was also a bone of contention. The disagreements were particularly fierce with respect to the nature and status of psychology which gradually established itself as a discipline independent of

philosophy.

In France Comte considered himself the founder of the new science of ‘sociology’, applying scientific method and knowledge to the understanding of social behaviour and to the reconstruction of human societies. His Law of the Three Stages states that there are three stages of intellectual development. In the theological stage, phenomena are explained in terms of the activities of supernatural beings. In the metaphysical stage, explanations appeal to abstract forces. In the third and final positive stage, the human mind seeks the invariable relations of succession and resemblance between phenomena, and explanation is in terms of establishing connections between particular phenomena and some general facts.

In Germany Dilthey rejected the assimilation of the human sciences to the natural sciences. We have internal knowledge of our mental life, a direct understanding different from the external knowledge of an alien, external world. We understand others by analogy with our understanding of our own mental life. Their actions are expressions of human minds, and we understand them by re-living their experiences. This kind of understanding is also applied to other expressions of the human mind—social institutions, literature and works of art. Later Dilthey developed what is now an influential ‘science’ of hermeneutics which embodies a procedure for interpreting written documents and other expressions of the human mind. Treating these expressions as coherent and unified, the hermeneutic procedure uses the parts of the whole to mutually clarify each other.

Charles Darwin’s *The Origin of Species* propounded a contentious theory of evolution. One important issue was the application of evolutionary theory to ethics. Herbert Spencer developed an uncompromising version of Social Darwinism in which the process of natural selection in social life was to be left unhampered, with the weak having to fend for themselves.

The issues mentioned in this brief introduction are among those discussed at much greater length in the various chapters. Some issues and philosophers are discussed in several chapters from different points of view and in different contexts. The styles of the authors of the chapters are different, as are their opinions and philosophical sympathies. But they have all given their own illuminating interpretations of a wide range of philosophical theories.

CHAPTER 1
The early utilitarians

Bentham and James Mill

G.L.Williams

Jeremy Bentham was born in 1748 in London; his prosperous father, a lawyer who became wealthy from property rather than the law, planned out for his son a brilliant legal career. After an early education at Westminster and Oxford he was called to the Bar in 1769. However, instead of mastering the complexities, technicalities, precedents and mysteries of the law in order to carve out a successful career, Bentham's response to such chaos and absurdity was to challenge the whole structure of law and to attempt to replace it with a system as perfect and as rational as it could be. In many ways a typical *philosophe* of the eighteenth century, Bentham at this early stage seized on the possibility of improvement through knowledge, on the supremacy of reason over superstition and of order over chaos. Despite his living and writing into the new age of the nineteenth century—post-revolutionary, industrialized, democratic—this early inspiration that enlightenment would bring about a better world never left him. To help create a world as it might be—as it ought to be—rather than succeed in a world as it was—customary, prejudiced and corrupt—was his constant aim whatever the particular object he pursued within his encyclopaedic interests, and whether the study be abstract and philosophical or detailed and practical. His central concern was the study of legislation, a concern developed from his own disillusionment with the state of English law and his positive response to the works of those like Helvetius and Beccaria who had argued that there must be some general and rational test as to the adequacy of existing law in order to justify its reform. As we shall see, this task involved both expository and censorial elements and the principle of utility which Bentham formulated provided the basis of his life's work.

During the eighteenth century his main approach assumed that the successful achievement of Enlightenment thought would lead to its equally successful application through direct contact and conversion of benevolent despots or at least their influential advisers. In the 1780s he spent two years in Russia with some hope of convincing Catherine the Great, but with his failure to gain influence amongst the powerful, whether over his general ideas or over his detailed projects, he became increasingly convinced that sinister interests—the law, the Church, Parliament—would act as obstacles to Reason and Reform. In which case, politics would have to be reformed—the ruling elite would have to be tamed—before his life's work could be realized. Constitutional law not just civil and criminal law stood in need of drastic reform. The influence of James Mill and later the growth of a school of reformers—the Philosophical Radicals—gave Bentham, now in his sixties, a new zest for work and an added commitment to reforming

the law in Russia, America, Spain, Portugal, Greece, Latin America, as well as to reforming all manner of abuses in British public life. Indeed he was as productive in the last twenty years of his life as he had ever been before, if not more, and his belief in the supremacy of his method and his principle as the key to philosophical and practical advancement was as clear and deep as when he first discovered it over sixty years earlier.

The starting point for the whole project which gives meaning and form to these brief biographical points was Bentham's early realization of the importance of language. Not only in the field of law, where falsehoods, absurdities and nonsensities were common, but in many other fields as well, careful definition was sacrificed to vagueness and emotiveness. The dominant and therefore sinister interests in any area—law, morality, politics—maintained a language in which the words were either totally unclear or contained an inherent prejudice or bias in their favour. Unless language could be made clear the truth would be concealed and the possibility of improvement would be lost. Definition is the key and it depends first on distinguishing between real and fictitious entities and then on determining the legitimacy or not of the latter by Bentham's new method—that of paraphrasis.

Nouns can be divided into those which are names of real entities—those things whose existence gives immediate consciousness, which can be directly perceived by the senses, and which are either states of body or states of mind—and fictitious entities which are referred to as if they really exist but need further exposition to give them meaning. In the first category the most basic examples would be pleasure or pain while in the latter the most frequent examples, say in law, would be duty, right or power. These latter are linguistic constructs and as such are 'fictions' but, as those examples show, this does not mean that language could do without them. Although they do not exist in themselves and although they give rise to doubt and confusion this does not mean that they are all meaningless. Fictions then are necessary, but how to distinguish fictions that are legitimate from those which are strictly speaking nonsense—fictional entities from fabulous entities? The key here is a method which while 'translating' fictional entities into real entities at the same time gives a criterion for denying meaning to those fictions incapable of such 'translation'.

The method Bentham discovered was that of paraphrasis, the only mode of exposition for those abstract terms where there was no superior genus to which they belonged and where the Aristotelian method of definition *per genus et differentiam* was thus inapplicable. To define a fictitious entity only by reference to other fictitious entities offered no solution. The clarification needed is in terms of the real and perceptible; Bentham does this not by translating one word by another or one term by its component parts, but by translating one sentence in which the term appears into another which is equivalent but in which the fictitious entity is replaced by a real one. In these two parallel propositions the import would be the same but the device of paraphrasis would give simple clarity to the sentence translated and if such translation into real terms were impossible it would reveal the fabulous or nonsensical nature of the original ([1.5], 495). An example might help here: however much we might classify rights and duties, the general idea of a right or duty can only be explained by paraphrasis—thus a sentence containing those terms would be translated into one explaining for what the law makes us liable to punishment, for doing or not doing, and punishment is then further explained in

terms of pain, a real entity. Thus a fiction is made clear by its translation into its relation to the real. Ideas are thus clarified by reference to their context—the sentence; whether or not the sentence can be paraphrased into one which contains real terms is the deciding factor with regard to its sense or nonsense. In a sense the substitute sentence provides the possibility of verifying the original by reference to the world of real entities. Thus if the word 'duty' were used without reference to the pain through punishment which the law laid down then the 'duty' would have no more meaning than an expression of opinion.

In this way the law, by distinguishing between the real and the fictitious and between the fictitious which can be paraphrased or verified and those fictitious entities which cannot be, can be clarified and reformed. The fabulous entities will be purged, the (legitimate) fictional entities will be established on firm—because real—foundations. These real entities are pleasures and pains and where some might refer to 'frugality' and 'thrift' and others to 'meanness' and 'greed' these in the end come down to the pleasures and pains consequent on the action not on any inherent goodness or badness in the motive. The real world must be recognised in this way and all fictions, however necessary, must be referable to them. It is thus important to reform language to give it meaning and so be in a position to change the real world. The slate of confusion, mystery and corruption must be wiped clean and on it written only that which makes sense by being real. Once this is done the process of describing, classifying, quantifying as well as the process of prescribing and reforming can begin—a science of legislation both accurate in detail and conducive to improvement can begin to be formulated. Once vagueness and ambiguity are eliminated and abstract terms are replaced by concrete detail then the way is open for a clear understanding of human nature which will provide the basis for a system of legislation which in turn will be the great instrument for social progress. Bentham's intention was to combine the discovery of new principles with detailed attention to their practical uses; indeed he saw his own genius as lying in the introduction of rigorous detailed investigation to supplement the more traditional concern with general principles. In this he compared his work with that of the natural scientist though in his case the detail came not from observation and experiment but from analysis, classification and division. His belief in the fundamental importance of a clear and accurate vocabulary underlay his early optimism that reason once employed would be the vehicle of both accurate exposition of the law as it was and enlightened criticism of the law as it ought to be.

The *Introduction to the Principles of Morals and Legislation* ([1.5], 11) is Bentham's best known attempt to outline the fruits of this new method by outlining his principle of utility and the structure of law which would result from its adoption and application.

> Nature has placed mankind under the governance of two sovereign masters, *pain* and *pleasure*. It is for them alone to point out what we ought to do, as well as to determine what we shall do. On the one hand the standard of right and wrong, on the other the chain of causes and effects, are fastened to their throne.

This striking though rather compressed summary of his basic philosophy puts forward two distinct claims, though in a manner not altogether without confusion. Following Hume, Bentham was always emphatic that the idea of what is must be kept distinct from

the idea of what ought to be, and thus he is here making two claims, a factual or descriptive one and also a normative or prescriptive one. The first is that human beings are so constituted that what they seek is pleasure and the second is that every action is judged right or wrong according to its tendency to augment or diminish such happiness (or pleasures over pains) for the party involved. Thus Bentham is involved in two enquiries—the one into human nature and the other into moral philo-sophy. Although the second should accord with the first it could not be logically deduced from it; indeed strictly speaking it could not be proved at all. However, that these are two separate statements is important to recognize despite Bentham's linking of them both to Nature. The normative or critical principle indicates what ought to happen, the end, the goal of legislation; the descriptive indicates the material, the limitations imposed on the legislator in achieving those ends. For the project to work these two aspects must be made consistent—the pursuit of pleasure by the individual as a natural activity must be made compatible with the achievement of the happiness of the community over whom the ruler legislates. Only if the two principles are kept separate can the critical one do its work, the work of improvement and reform; indeed only then does it have a role at all. The principle of utility or the 'greatest happiness' principle is meant to be realizable and thus must recognize the natural qualities of human beings, but it has to work on or modify the ensuing conduct in order to achieve its moral end. Whether and how the individual pursuit of pleasure can co-exist with the community's aim of greatest happiness is an issue to be resolved once further exploration of the two claims is completed.

The natural statement—of what is the case—amounts to a form of psychological hedonism, that all action willed by human beings is motivated by the desire to obtain pleasure or avoid pain. This does not necessarily imply psychological egoism, that it is only the agent's own pleasure or pain which acts as the motivating force, though, as we shall see, Bentham sees this as a general rule. However, is the hedonism which Bentham believes in a matter of fact, a matter of definition, or itself also a generalization? Is it an *a priori* axiom or the result of observation? Although Bentham at times seems to incline towards the latter, in that he cites evidence and the results of observation, his enumeration of the great range of motives is entirely in terms of pleasures and pains—not certainly all egoistic—but nevertheless making all human conduct analysable in those terms. Thus the 'facts' of human psychology reflect Bentham's earlier view that the only real entities are pleasures and pains. Such motives can be social, dissocial, or self-regarding but they all correspond to pleasures, even those of goodwill or benevolence. Where all examples can be thus described in terms of pleasure and pain, the original assumption becomes definitional rather than empirical. However, such pleasures are not all self-regarding even if in the final analysis the pleasure sought is the agent's own, for it is still possible to distinguish such pleasures from those more obviously concerned with self-preference. Put differently, while every motive has a corresponding interest this need not strictly speaking be self-interest in a crude egoistic sense.

Nevertheless, having made due allowance for the social motives of sympathy and benevolence, Bentham did not consider them to be of great force and argued that generally self-preference was predominant; certainly it should be the basic assumption for the art of legislation. He argues that such self-preference is the normal state for normal people and that the design of law should reflect this. It is not a definition *a priori*

nor a factual truth—the one would be trivial and the other false—but a generalization which is not only true as such but is the only working assumption which a legislator can adopt. In this way all human conduct with all the possible motives influencing it can be reduced to pleasures and pains—real entities experienced by real individuals whose psychology generally puts themselves first. Thus a scientific approach becomes possible in that pleasures and pains become the unit of classification, measurement and comparison. Certainly this will be no easy process, not least because each individual may judge pleasures differently, but the fact that the legislator is dealing with observable conduct which it can be assumed indicates the strength or weakness of the motive opens up the possibility of rational calculation. The evidence of interests, of the pleasures which motivate people, is thus their conduct, and the relative value of such pleasures and pains can be observed. As it is only consequences that count and as these are empirically observable then science can begin its work. The process of analysis and quantification in terms of calculable units offers the opportunity of seeing human conduct with a clarity and precision never before seen.

Although there were a huge variety of pleasures and although exact comparison between the pleasures of different people with different sensibilities and in different circumstances would not be possible, nevertheless from the point of view of the law or policy-maker general calculations were possible. This was to be done through recognizing that pleasures had certain dimensions of value and that the sum of these would give the overall result. Thus intensity and duration were relevant in estimating value as were the degree of certainty and the degree of remoteness of a pleasure, the likelihood of further pleasure following on or the opposite effect occurring. In addition the number of people affected, or the extent of the pleasure, must enter the calculation. Unless this sort of common measure, or currency, were introduced then no comparison would be possible and neither individuals nor legislators could conduct their affairs with any order or rationality or predictive force, those very elements needed for the successful pursuit of the interests which all human beings aimed at.

As well as giving Bentham a fundamental reality by which to describe human behaviour, the idea of pleasure and pain also enters into his moral principle that the only legitimate standard for the individual and the community is utility or the ‘greatest happiness principle’. This is his great critical principle designed to promote reform, not a principle, as with Hume, to explain the rationality of custom and constraint but to emphasize the gulf between what is and what ought to be. It is Bentham’s attempt to erect an external standard by which disputes can be resolved by a rational calculation of various options; these options being in turn resolvable down to questions of pleasures and pains. The principle cannot be proved but it is for Bentham the only objective alternative to the mere expression of personal taste. Utility or caprice, reason or mere sound—these are the options and Bentham emphasizes the need for a standard which can be empirically applied. There is no ultimate proof that happiness is better than suffering but, once presented in this way, Bentham is confident that all reasonable people would choose the former and having done so his task is to convert such a principle into a detailed and radical weapon for change.

If happiness is the goal and if moral language is meaningless without reference to this standard then the legislators’ task is to create a legal order in which the fictions with

which they work are constantly reduced to the real entities of pleasure and pain which should act as their guide in maximizing the community's good. Thus the moral evaluation of a law or a policy proposal comes down in the end to matters of fact, to observation of consequences, to verification. Similarly the tools which the law uses in order to create 'the greatest happiness' are also examples of pleasures and pains, the most notable of course being punishment. The attractiveness of the principle then is that it provides a framework for moral criticism and evaluation which respects the reality of nature and by judicious modification of human behaviour it transforms what could be a life of irrational suffering into one of happy enjoyment. The prescriptive principle is not confused with the descriptive acts; otherwise it would have no role to play. Instead it enables us to become moral actors rather than mere pleasure-seekers, to appreciate our duties and to follow them rather than pursue without restraint the self-preference which our nature inclines us towards. The terms 'duty', 'ought', 'right' and 'good' carry no meaning for Bentham unless they are used of actions which conform to the principle and thus can be translated into statements whose factual elements can be verified. How then are the duties which arise from the moral principle to be reconciled with the pursuit of the self-regarding interests which are posited by the psychological principle? Is the latter, which sees the agent's own happiness as the natural goal of behaviour, compatible with the former, which directs us to act in conformity to the greatest happiness? Could an answer be found which preserved both of the two claims which Bentham is concerned to support? Certainly Bentham did not want to depart from the view that the driving force in society was the individual pursuit of happiness and there is no attempt to replace this with moralistic pleas for altruism or benevolence; equally he holds firm to the principle of utility. Thus duty or conformity to the principle would also have to be something which it was in the interest of the agent to perform. Given the assumption of how people do behave, the society must be so ordered that this behaviour coincides with how they ought to behave. In other words, through the use of sanctions—physical, moral, political and religious—the society would give people an interest in performing their duty. The most powerful influence to bring this about would be punishment, that artificial pain, which would force men to recalculate their happiness and act in accordance with the general well-being. The motives natural to each individual would remain the same but the new threat of pain would deter the anti-social act and create a situation where it would be in an individual's interest to do his or her duty.

It is on the basis of this belief in people as they are and society as it ought to be that Bentham undertakes his massive investigation into the principles of law—constitutional, civil and criminal—and the detailed application of these in all areas of life. And this was a political activity, one geared to bringing about change, not merely an intellectual project aiming at clarity and enlightenment. Bentham was well aware that utility had been a standard held by others in the past; the need now was for it to be applied in detail and through this to be accepted and implemented. Utilitarianism was a theory about the State, government, law, public matters generally, and although Bentham's works published in his own lifetime wander from principle to detail, from general to particular, the total work is a logical and exhaustive—and exhausting—survey of the most general framework of law, the constitutional, down to the most minute detail of actual laws, offences and punishments.

If we turn to the broadest framework of law relevant to the utilitarian aim of reform, Bentham's major work was the *Constitutional Code* [1.6] not begun until he was over seventy and the most developed account of his mature views. In his earlier days he had held a rather naive view that enlightenment—clarity and reason—would itself persuade rulers of the need for legislative reform, but after his adoption of the need for a radical overhaul of the system of government he developed his detailed system of representative government. The *Constitutional Code* was envisaged as the first stage to three other Codes—Procedure, Penal and Civil—which together would make the Pannomion, a complete body of law. It was meant to be a three-volume work but only one was printed in Bentham's own lifetime, a volume which included chapters on the electorate, the legislature, the prime minister and the administration—the whole framework within which the democratic principle would work and where laws would be made according to the principle of utility rather than in response to the sinister interest of those in power. Unless the constitutional arrangements are right then the resulting laws and policies will be likewise flawed. These arrangements must be based on the principle of utility, not on any useless fiction like the original or social contract, a point he had made as early as 1776 in his *Fragment on Government* [1.5]. However, the point is now made in conjunction with his suspicion of sinister interests, and the framework must now be democratic and also contain protection against the tendency of those in power to rule in their own interests. As with human nature in general, interest must be brought into accord with duty, and this is as important a problem in the constitutional arrangements as it is in the spheres of civil and penal law. The possibility of divergent interests between the rulers and the ruled, the few and the many, would not simply disappear with the inauguration of representative democracy but would need rigorous safeguards to prevent it. It is on this issue of making rulers constantly accountable that Bentham is at his most novel and most detailed.

In his own time, Bentham's analysis of democracy was somewhat overshadowed by the more popular and striking writings of James Mill and it is only in recent years that painstaking and illuminating research has brought out the range and quality of Bentham's innovative ideas ([1.6] and [1.50]). The older view of Bentham as someone arguing naively from first principles to their logical and democratic conclusion (people put their own interests first, the rulers do likewise, therefore the people must rule in order to maximize the general interest) is replaced by a much more sophisticated account which combines the empirical approach with the critical utilitarian one. At its heart is a scepticism regarding the ability of institutional arrangements alone to bring about the greatest happiness; they must be subject at all times to the scrutiny of an informed and involved public.

If we turn first to the arguments in favour of representative democracy and then to the extra safeguards to protect against misuse of power we can appreciate most fully Bentham's originality and, it can be argued, also the value of his neglected contribution to democratic thought. Viewing political societies generally, Bentham replaces the traditional concern with discovering their origins in order to define their character, limits and legitimacy with the simpler view that they exist wherever there is a general habit of obedience to a person or assembly. In a democracy the sovereign constitutive authority lies with the people while the legislative authority is omnicompetent within its own

domain. It is the people who choose the rulers and who may dismiss them if they fail to serve the greatest happiness; in turn only the rulers have the power to make and execute laws which, because of their representative nature and their accountability to the people, they are likely to do in the common interest.

Looking at the more detailed application of this basic relation between rulers and ruled, we see the state divided into equal districts each electing a member to the legislature while also having its own sub-legislature and forming a judicial district. This model, depending on the size of the State, would be applied also to sub-districts and if necessary to smaller units again. The electorate in each district is based, with few exceptions, on universal manhood suffrage (the world may not yet be ready to grant female suffrage though there is no logical reason to exclude women) and the electors both choose and may dismiss the representatives; mistrust is built into the system and the power of the people preserved. The legislature so elected by secret ballot is a single chamber, normally elected for one year, and comprising full-time and paid members. While this legislative branch is checked by the constitutive branch—through elections and dismissals—it in turn is responsible for the appointment and control over the administrative and judicial branches. The prime minister and justice ministers are elected from outside by the legislature and they in turn appoint ministers from within the legislature and judges respectively. The power to dismiss such appointments lies with the prime minister and justice minister but also with the legislature and the electorate as a whole, such power extending in the latter two cases also to dismissing the prime and justice ministers themselves. Thus the administration and the judiciary, while not being directly elected by the people but chosen for their intellectual and moral qualities, would nevertheless be subject to popular control through the electorate's power of dismissal and if need be punishment. To render this democratic control meaningful, Bentham insists on the open nature of government, administration and judicial affairs, and includes maximum publicity at all stages of the conduct of public affairs. Further, a similar arrangement of elections, legislatures, administration and judiciary is applied at the local level, maximizing at all levels the power of the people and thus the securities against misrule.

In this way, the tendency of those in power to pursue their own interest—one which in an unreformed system sees the wealthy rule at the expense of the poor—must be guarded against even in the reformed constitutional democracy which Bentham outlines and the major antidote to the sinister power of government is public opinion. However precise, exact and carefully constructed the constitutional details may be, it is the power of public opinion which is the final guarantee against misuse of power by the rulers. So important was this view to Bentham that he envisages a Public Opinion Tribunal, the voice of the general interest speaking through meetings, speeches, writings and the press, in order to inform, criticize, praise or support the actions of the more formally constituted elements of government. Thus while the people do not themselves rule, their involvement is not restricted to mere elections; they are the guardians as well as the source of power.

More than this, Bentham also believes that his proposed system would protect the individual against abuse of power by the government. Although dismissing any idea of natural rights as nonsense, as fictions which are illegitimate because untranslatable into the real entities of pleasure and pain, he nevertheless pursues a somewhat similar goal of defending the individual, through his concern with securities against misrule. In a sense

the whole constitutional system is designed to deter the rulers from abusing their power—through elections, dismissals, publicity, and so on, i.e. through the practice of responsibility and accountability. The system is based on the principle of mistrust and although the legislature is omnicompetent it is limited by the continual scrutiny of the public over its actions as well as by its limited duration. The legislature is essentially dependent on the people and this for Bentham is a greater guarantee of the security and liberty of the citizen than any appeal to rights, whether abstract or legal. In addition, as we shall see, one of the main aims of the law is security, as one of the essential elements of happiness, and for Bentham this security, which it was the duty of the law to maintain, solves those problems traditionally discussed in terms of individual liberty. Constitutionally, however, accountability was the chief means to ensure the security of the individual against oppressive State power through the ability of individuals to control their rulers.

Given this radical overhaul of the system of government it is necessary to see why it has taken place—whatever the source, power and limits of the legislature its function is to create and impose law according to the principle of utility, thus providing an alternative to the traditional view of law as something which grew organically and embodied the wisdom of the past modified by judges in the light of new experience. In many ways this idea of common law was always Bentham's chief target for he saw it as a massive and illegitimate fiction; real law was the expression of the will of the sovereign legislature and should be clear, known and in the general interest not vague, dependent on judges and serving the interest only of lawyers. The law should be the deliberate and rational instrument whereby to create the greatest happiness through the harmony of duty and interest. The test of law should always be its success or failure in making individuals so act as to maximize their own pleasures but in doing so refrain from inflicting pain on others. To attain this end of modifying human behaviour it must be known in advance; otherwise it could not serve its purpose, and Bentham's alternative to the mysteries of the common law was his proposal for the systematic codification of all law. Its validity would be gained from its source, the legislator; its morality from its purpose, utility; but its efficacy from its clear and rational formulation in the form of a code. Such codes would make the law accessible and comprehensible to all through the clear enumeration of offences and the accompanying rationale in terms of utility. It is through the classification of offences and their corresponding punishments that a framework is established such that the good of community can be maintained. Only then would it be known unambiguously what was unlawful, what rights existed, and what punishments were threatened. In this way the unlawful act would be deterred and lawful ones encouraged. The security of the individual would thus be assured.

The key to offences where punishment is involved is their detrimental nature to others; if the offence is entirely self-regarding and involves no other individuals, groups of individuals or the community at large, then the law has no role to play. In this area of an individual's duty to himself or herself, he or she can be left alone to pursue happiness in the way judged best. Punishment being itself a pain is an evil and can be justified only if it prevents the greater evil of the offence under consideration. The threat of punishment should influence the calculation which the individual makes of his or her own interest; it is this fear which acts as the primary deterrent. Punishment looks ahead—it is concerned

to prevent future mischief—rather than backwards, as a retaliation for mischief done. Within this perspective there are four further restrictions on the use of punishment (in addition that is to self-regarding conduct): where it is groundless, there being no real mischief to prevent; where it is inefficacious, where it cannot work to prevent mischief; where it is unprofitable, where the cost is too great; and where it is needless, where other means would do as well. At the heart of the perspective is the idea of punishment being used economically—an offence brings a profit and the punishment must threaten a loss sufficient to outweigh the temptation to commit the act.

If Bentham's constitutional reforms were in place and his view of law established, with offences and punishments reflecting the principle of utility, a major question would still remain—would the laws aim at the maximization of aggregate happiness and thus risk the possible sacrifice of individual happiness if and when necessary for the general good, or would the laws work towards the general welfare within the limits of some standards of fair distribution such that individuals would have rights or securities against despotic domination? Is there any connection between Bentham's theory and the liberal desire to protect individual rights against democratic rule or are the two perspectives hopelessly at odds? Should the law aim directly at utility or should it aim to establish rules through which individuals are guaranteed an area in which they pursue their own good in their own way? Is there a framework of rights within which individuals operate or is the general happiness to be pursued and dictated according to the changing judgement of the law and policy-making body? Having established a system of government in which public opinion plays a dominant role, what is there to prevent such opinion operating in a tyrannical way?

In order to answer these questions it is useful to look more closely at the ends at which government ought to aim. As we have noted, the major aim of legislation is security, without which there could be little pleasure or happiness. Unless security of expectation were established no ordered social life would be possible, happiness could never be enjoyed with confidence, long-term pleasures would not be pursued, well-being would be constantly threatened. Although in a general sense pleasure is the only real goal, yet individuals differ on their estimation of what gives them pleasure, and thus the legislator cannot judge on their behalf and thus should not aim to maximize the individual's pleasure but rather provide the basic security, or liberty, by which individuals, judging for themselves, maximize their own happiness. By defining offences and establishing rights, the law created an area free from interference where pleasure could be pursued without harmful consequences to the interests of others. Security is the necessary guarantee of both present and future enjoyment of individual interest, and this is what above all the law provides and provides uniquely. Within this perspective the problem of defining, comparing and calculating pleasures becomes less important, for within the limits laid down by the law the problem passes over to individuals to evaluate and to act as they see fit. This emphasis on individual judgement and control, together with his concern for free elections, free speech and freedom of the press, has led some modern commentators to see Bentham as a liberal utilitarian rather than seeing his utilitarianism as a threat to individual liberty. By seeing security as one of the four main aims into which the general happiness can be divided, it is argued that Bentham's theory avoids the authoritarianism conventionally ascribed to him. Protection against intentional offences was the first

priority of law but Bentham also envisaged a fairly wide area of responsibility for the government in preventing a whole range of dangers which could threaten the security of individuals. By thus minimizing pain the individual was free to pursue pleasure in the sphere made secure through the protection of the law.

The second major end involved in the general happiness was subsistence and although in general this could be left to individuals who would naturally seek it, there would nevertheless be circumstances where its attainment would demand government action either by intervention in the economy or through direct provision of relief, involving the limited transfer of means from the rich to the poor. Similarly with the third end, abundance, this would normally be a natural goal best left to individuals. However, the fourth of the subordinate ends, equality, is at once something desirable from a general utilitarian point of view and something threatening from the particular point of view of security.

In Bentham's argument, equality follows from the diminishing marginal utility of wealth or other goods—a pound is worth more in terms of pleasure to a poor man than it is to a rich man; thus redistribution of wealth would maximize aggregate happiness. However, pursuit of this goal appears to threaten the chief object of law which is security of expectation. While equality of rights can be maintained—everyone's security is equally protected—a substantive equality of wealth cannot be guaranteed without undermining people's expectations of future enjoyment. Where the reduction of inequality could occur without damage to security—through various forms of taxation, for example, or through the provision of services to aid the sick, the uneducated or the poor—then this would be justified, but generally Bentham's commitment to political equality does not extend to the material sphere. The primary goal is always security as the framework for the realization of happiness but where suffering and pain can clearly be eliminated through government intervention then this is an obvious responsibility which the government should accept. Indeed much of Bentham's writing is concerned with practical proposals for the reform of prisons, factories, health and safety, education, poor relief and other social institutions.

Although much of Bentham's reputation came from his fierce denunciations of the sinister interests of the ruling establishment of his own day, he was as concerned to construct proposals for future government action as he was to oppose present government action. The test was always utility and, while this might point to action in some cases or inaction in others, it could never justify negligence. In general, nothing could restrict the omnicompetence of the legislature—except utility—and Bentham sees its work not as interventionist or *laissezfaire* in principle but as guided in practice by the general welfare as broken down into its four aims of security, subsistence, abundance and equality. And where utility pointed, Bentham followed—and in great detail. Thus, not content with merely outlining the principles of punishment, he devised in great detail and at great personal expense and over many years a model prison, the Panopticon ([1.12], vol. 4). Similarly in other areas, principles had to be applied and in minute detail to test their possibility and to make utilitarianism a practical reforming creed rather than merely a philosophical rationale. Whether it be the architectural details, the hours of work, the rates of pay, the balance between humanity and economy, the details of the syllabus, the form of record-keeping, whether it be prisons or workhouses, schools or factories, detail

was always the test of principle: what ought to be must always be compatible with what could be.

Morality must work with Nature not against it, thus making it a realistic cure for social ills. At times this concern with gathering facts and information can make Bentham appear to value the exercise for its own sake but that would be to forget the inspiration behind his life's work—the desire to do good for a species which ironically he had to assume was itself only concerned with its own good. It was not enough to be a philosopher; his ambition was to be practical, useful and realistic—a critic who could construct as well as demolish, whose goal was both modest and magnificent—to build a system in which people might be happy. And the system as finally devised was one in which the people themselves controlled the system. Indeed one test of the whole enterprise was that once the creation had been completed, the creator was no longer needed.

This movement in Bentham's thinking from reforming the law to reforming the whole structure of political arrangements from which the law would emanate—the movement from adviser of rulers to champion of the people in order to bring about the reign of utility—owed a great deal to the influence of James Mill, who brought to the utilitarian cause not only a sharp, lucid and persuasive style of powerful literary propaganda but also a democratic hostility to the establishment and a rigorous reforming programme in the fields of law, education and political economy based on a foundation of associationist psychology. Often overshadowed in the literature by his friend Bentham and by his son, John Stuart Mill, James Mill was a thinker and active reformer of independent stature. In many ways he was a more dominant figure amongst the radical utilitarians than the master himself.

James Mill was born in 1773 in a small village in Scotland, the son of a shoemaker and a farmer's daughter. After his early education he went to the University of Edinburgh in 1790 and after that studied Divinity and was licensed as a preacher in the Church of Scotland in 1798. Engaged as a tutor by Sir John Stuart he accompanied him to London in 1802, married in 1805 (John Stuart Mill was born a year later), and met Bentham in 1808. From 1806 to 1817, he was busy writing the *History of India* while also writing journal articles and his influential essays for the Supplement to the fifth edition of the *Encyclopaedia Britannica*. Following the publication of his *History of India* in 1818 [1.59], he was appointed to the East India Company where he became Chief Examiner in 1830. He continued to write regularly for radical journals, published his *Analysis of the Phenomena of the Human Mind* [1.54] and his *Fragment on Mackintosh* [1.58]; he died in 1836. His association with Bentham lasted from 1808 until the latter's death in 1832; for some four years he and his family lived with Bentham at Ford Abbey, but his influence on the utilitarian movement was that of someone who brought to it a systematic philosophy already formed rather than that of a mere disciple.

Mill had been educated at Edinburgh and was strongly influenced by the Scottish philosophy of Dugald Stewart and Thomas Reid. From Stewart, amongst other things, he learnt the importance of adding a concern with reform of existing institutions and the development of enlightened legislation to the more traditional concern with explanatory description, a distinction similar to Bentham's between censorial and expository jurisprudence. Thus philosophy must move from the reflective or sceptical to the active and optimistic. In addition, Stewart's lectures introduced Mill to the philosophy of Reid.

Reid's philosophy of experience and common sense came down firmly on the side of induction and against deduction, following Bacon and Newton, and although Mill later rejected the Christian underpinning of this philosophy—that we know only because God has given us the power of perception—he held fast to the importance of induction, learning from experience, in order to formulate general laws which in turn would be the basis for deductive reasoning. For Mill the centre of such enquiries into the laws governing human behaviour were the laws of psychology which could be known through observation of the study of mental phenomena. The result was Mill's doctrine of association: the mind perceives the external world by sensations—smell, taste, hearing, touch, sight—and what remain once the sensations cease are ideas. These ideas are copies of the sensations, and just as sensations are associated together, and more strongly the more frequent and vivid the connection, so ideas are associated in the same way. Knowledge is the result of frequency of conjunction; in some cases the frequency and strength is such that the ideas cannot be separated and this is what gives us our belief in the external world. All our mental faculties can be explained by this principle of association as can our behaviour in response to the two ultimate elements of painful and pleasurable sensations. We learn about the world by associating certain actions with certain sensations and thus learn to avoid the one kind and seek the other. Thus the route to the fundamental reality of pleasure and pain which Bentham had discovered through his logical notion of real entities was found by Mill through his notion of the psychological association of ideas as copies of sensations. And just as Bentham's discovery gave him a weapon by which to attempt to change the world so did James Mill's; that their objectives coincided should not blur the differing starting points. It is in pursuing their shared objectives that, at least in a political sense, Mill shows himself the superior.

While Bentham wrote voluminously but published relatively little about the whole range of philosophical, constitutional and legal enquiries, Mill directed his attention to converting the relevant public through concise and clear articles. His *Encyclopaedia* articles were superb examples of a combination of his philosophical views—notably his doctrine of associationism—and his radical political views. They were intended to have an impact and in this they succeeded. His article on 'Education' is probably the clearest example of this attempt to put philosophy into practice. Given that the mind knows only through sensations and their sequences, the object of education is to provide for the constant production of those sequences most conducive to happiness; the individual is virtually what education in the broadest sense makes him or her. If the right associations are made early on in life then education improves not only the intellect but also the moral character. The whole environment has an effect on the progress of the mind, and thus 'education' for Mill encompasses a far wider range than conventionally thought of, and has implications for social and political change. Thus domestic education starts at birth, and associations must be so ordered that the happiness of the individual is the end but one that is bound up also with the happiness of others. After this early formation of character, education in the more normal sense continues to aim at the development of both the intelligence and the moral feelings as the key to happiness. This is supported by the effect of society and government which should provide the environment in which the pursuit of individual happiness harmonizes with general utility. Thus education is a question not

simply of the advancement and spread of knowledge to all members of the community but, as importantly, of the development of mutual sympathy and benevolence amongst them. Thus where Bentham had relied on sanctions in order to bring duty and interest into harmony, Mill is more optimistic of the beneficial effects of education in developing the right associations between one's own pleasure and the good of others. To achieve this, early environment as well as school education needs reform within the context of a reformed society led by a reformed government. Only then will individuals pursue their happiness with that degree of self-control which recognizes the importance of the happiness of others.

However, such moderation and harmony cannot be generally expected in an unreformed society and the key to improvement here is to change the system of government. Here Mill's next famous and influential article was his essay on 'Government' [1.56] which highlights the link which Mill forged between utilitarianism and radicalism and which explains his importance to the school of philosophical radicals. His basic argument is that government is necessary in order to protect for each individual the fruits of his own labour. As it is labour not Nature that provides the means for life and happiness and as men, without restraints, would take from each other what they desired and thus undermine the whole enterprise, then a system of government is necessary. Unhappily, however, governments are also composed of men who again, without restraints, would plunder and oppress their fellow men. The laws of human nature are such that the pursuit of pleasure is the primary motive for those within as for those without government, and the main means to such ends are wealth and power. The mere establishment of government, therefore, provides no guarantee that the rulers will follow the general interest rather than their own; indeed it guarantees the very opposite. Hence, the need for government is accompanied by the need to ensure against its oppressive tendencies. Human nature explains the need for government, the dangers of government, and also the key to good government, where the basic problem is one of restraining the power-holders from abusing their role.

Such securities against misrule cannot be found within any of the traditional forms of government. A democratic government—in the literal sense of the whole community gathering together as often as the business of government required—would be near impossible as well as ill-adapted to decision-making. An aristocratic form of rule would naturally pursue its sinister interest against that of the community; so much more so would a monarchical form. Further, any mixture of these three forms is also unable to secure against abuse and thus guarantee the general interest. If there are three powers, two of them will always be able to swallow up the third, and that will mean the monarchical and aristocratic, whose sinister interests are opposed to the people's interests, rendering the community defenceless against its powers. We all desire our pleasures and we all need wealth and power to achieve them; small wonder that the prize of government is so keenly sought by those who want to further their own interests.

From the general viewpoint there is therefore always a tendency for government to be badly conducted, for power to be abused; the antidote lies in a system of checks or securities to prevent such abuse. It is the discovery of representation which makes this possible, where the community's interest in good government acts as a check on the representatives who in turn operate as a check on government. The representatives, while

having an identity of interests with the community, have sufficient power to guard against abuse and thus secure good government. Limited terms of office and regular elections would guard against the representatives pursuing their sinister interest and thus destroying the identity which is the rationale of the system. In terms of whose interests should be represented—in crude terms, who should vote—Mill is prepared, at least in this essay which is an argument for parliamentary reform in the 1820s as well as a treatise on the foundations of government, to exclude those whose interests are included in those of others. Thus women and men under forty can all be protected by others and their interests pursued on their behalf. Such a system of representative democracy with an extended franchise could confidently be relied on to pursue the general interest, not least because the dominant part, the middle rank of society, is also the most virtuous and the one whose opinions are most respected by the class of people below them. They are the ones to set the political and social standards which will form the wider educational context for the general improvement of the community. Their influence, combined with that of the law and the formal educational system, will create a culture in which duty and interest go together, not so much as in Bentham because the citizens have an interest—through the various sanctions—in doing their duty but because through the principle of association the pursuit of interest will constantly have the consciousness of others' interests allied to it. Thus with political reform as with educational reform an effect on character will be produced as well as an effect on intelligence and wisdom.

In comparing Mill's case for representative democracy with that of Bentham a curious paradox appears. Mill, the historian of British India, who stressed the need for a close examination of the manners and institutions of that society before recommending any appropriate changes in its organization or government, here adopts a largely abstract deductive method, whereas Bentham, the upholder of that method of logic, appears in the *Constitutional Code* to include much more empirical evidence about the actual practice of societies in order to achieve the end of good government. Thus Mill is optimistic that representation can itself achieve an identity of interests between the rulers and ruled; frequent elections are the key safeguard. Bentham, as we have seen, insists on additional securities against misrule, so that while the legislature remains omnicompetent it is still subject to the power of the people, and much of his evidence in the *Code* is from existing countries rather than from the logic of the situation alone.

In fairness, of course, Mill could claim that the deductive method was one based on a prior and thorough induction giving rise to comprehensive and known principles of human nature. Further, his essay is a brief and direct case for reform rather than a complete study of government. Whatever the case, it is true that it was Mill's method as much as his conclusions which gave rise to fierce criticism at the time. Mill's leading opponent, Macaulay, accused him of assuming certain principles of human nature and then arguing deductively from them, ignoring completely the history and practice of government through the centuries. Even if there were any absolutely true principles of human conduct, no science of government could be deduced from them. Knowledge of politics comes from empirical study and induction, and the generalizations which result will be related always to the context of their discovery ([1.47] 97–129). As already noted, Mill's case, as the utilitarian one generally, was that the original proposition that it is self-interest which is the dominant motive was in fact based on experience. Without any

checks, so would men behave, and this need to prevent men from injuring each other in the pursuit of their interests is recognized as the chief function of government. The problem here lies in the status of the original proposition: is it a law of human nature supported by empirical evidence and holding true without exception or is it the only sensible assumption to make in order to organize social and political life? Mill's position seemed to waver between the two—a law that men's actions are governed by their interests, in turn explained by the association of ideas, or a prudential maxim that everyone should be supposed to be acting in their interests; in either case the only safeguard for good government lay through a system of representation to check against the abuse of power. It was this certainty in Mill's thinking, that utilitarianism had to point in a politically radical direction, that helped move Bentham from his original expectation that an enlightened despot or aristocracy would usher in the reign of utility to his mature position that democracy was an essential instrument towards the desired end.

That James Mill's position is more complex than might be assumed from his essay on 'Government' and the deductive method applied there can be seen by examining his further articles in the Supplement to the *Encyclopaedia*. Apart from what seems to be a simple faith in the identity of interest created by regular elections, Mill is aware that for electors to make informed choices and judge their rulers wisely they must have knowledge of their actions and be free to criticize them. Freedom of expression is thus added to the other securities against misrule. His essay on the 'Liberty of the Press' [1.56] attends to this problem. For the government to pursue the greatest happiness, for the system of checks to work, knowledge or the glare of publicity is essential. Democracy as institutionalized mistrust depends on the ruled knowing what the rulers are doing. Truth acts as the great restrainer; a free press is an essential security without which free elections would not serve their purpose.

Having established good government and provided securities against misrule, the question arises as to its responsibilities. As with Bentham, Mill sees the law as providing the framework of organized and secure social life. The law creates offences and these are violations of rights, every infringement of which involves an injury. Utility determines what should be rights and the law should translate these into legal rights. Not all painful acts are to be treated as injuries, for example when they result from people's antipathies to actions which cause no evil, as in the religious hostility to eating or drinking certain types of food or drink, as argued in 'Liberty of the Press' [1.56], 11). Thus while liberty is to be restricted where rights are violated, not every evidence of pain is to count as good reason for legal protection. As with Bentham's four types of case where punishment is not appropriate—because groundless, inefficacious, unprofitable or needless—so Mill excludes intervention where the evil of punishment is not outweighed by some positive good. The law's concern is primarily to deter the commitment of mischievous acts not to compel the individual to seek his or her own happiness in prescribed ways. A duty to oneself is a matter of individual prudence; the law steps in when duty to others is involved. And the moral sanction or public opinion reinforces the force of law in matters where considerations of utility can be objectively shown to be involved. There must be empirical evidence of mischief or injury not merely prejudice or antipathy; with Mill as with Bentham this was what made the principle of utility superior to others. Where there would be no pain without the antipathy, no harm without the dislike, then the case for

interference is groundless. Utilitarianism is an external standard capable of being applied empirically. And so the law creates the conditions in which all individuals are allowed to pursue their own conception of happiness secure in the knowledge that fellow individuals will not injure their rights and they likewise are equally secure, equally free to maximize their own good. The individuals' original mistrust of others is replaced by a trust based on the rightness and strength of the law.

Mill is optimistic that democratic reform would lead to utility and rejects the criticism that the poor, once in majority power, would pursue a short-term self-interest which would threaten the security of person and property which it was the law's main business to protect. He believes, on the contrary, that they would act on their long-term interests which involved the maintenance of private property and respect for individual rights. Both the influence of the middle class and the power of education would show people that the rational course demanded such moderation. In such a reformed environment people will indeed successfully pursue their own interests, but in an intelligent, temperate and benevolent manner. In this way Mill injects into utilitarianism a more high-minded tone than generally appears in Bentham, a tone to be accentuated further by his son, John Stuart Mill.

The influence of both Bentham and James Mill is a matter of some controversy, not least because it has to be assessed both philosophically and practically in order to respect their claims that proper understanding could only be tested by practical results. More than this, any practical changes which did occur cannot be unquestionably attributed to the utilitarian philosophy which recommended them. There were many other influences at work. Furthermore, it is difficult to pin-point the exact extent of Bentham's own influence exerted as it was by correspondence, conversation and public discussion as much as by his published work. That much of the reform was in accord with Bentham's thought is not conclusive proof of a connection yet the general atmosphere conducive to reform seems clearly to have been formed at least partly by the activities of Bentham, James Mill and their school of radical utilitarians. Generally speaking the reforms—political, legal, administrative and social—which took place in nineteenth-century Britain were much more modest than Bentham and Mill would have liked and the sinister interests so vehemently attacked by both thinkers were much more powerful and enduring than even they thought possible. Bentham's theory of democracy based on mistrust, accountability and publicity failed to dominate and instead the growth of democracy was attended with deference and secrecy. No written constitution was enacted, the Lords and monarchy survived, as did the Common Law, and the movement Bentham hoped for towards equality of power to challenge the privilege and corruption of the ruling few did not take place. Bentham's faith in the people and his hostility to those in power unless checked by the people was not the faith which motivated democracy; rather a distrust of the people and a reliance on a new ruling elite, more akin to James Mill's version, was the dominant theme in the movement towards democracy. Once Bentham had been converted to the radical cause he was clear that the key to happiness—a life of security, with adequate subsistence, the possibility of abundance, growing equality—lay in a democratic system with accountability as the primary value. In this sense his influence was less than that of James Mill or John Stuart Mill, both in different ways concerned with the quality of the rulers rather than the vitality of the

people; this is not of course to say that Bentham's argument was wrong, simply that his radical democracy was overshadowed by a version in which the people ruled only in a distant sense and with little direct involvement or power of supervision.

In the matter of more detailed legislation—parliamentary reform, local government reform, the Poor Law, prison legislation, public health—the growth of government intervention and central administration was influenced by the Benthamites along with humanitarians, philanthropists, working-class radicals and Christian campaigners. The pressure for reform came from many sources but in formulating the detailed proposals and insisting on central control through inspection, in making the new system accountable to government, the Benthamites played a key role.

It is of course in the field of moral philosophy that Bentham is best known largely because of his supposed inferiority to his successor, John Stuart Mill. He has been seen as the proponent of a crude version of utilitarianism which the younger Mill sought to improve. In this way his contributions in the whole field of law and of reform were often seen as suspect, resting as they did on what was seen, following J.S.Mill, as a defective philosophy. Mill's debt to Bentham and to his father was generally concealed behind his somewhat severe criticisms of them. Thus J.S.Mill's *Autobiography*, though giving a distorted picture of his father's character and influence, was regarded as the authorized version, and his critical essays on Bentham were thought to be no more than the master deserved. In consequence, the younger Mill's attempt to defend a new version of utilitarianism, despite later criticisms of it, was thought at least to be an advance on the original. Similarly with J.S.Mill's concern with individual liberty, it was seen as a radical departure from a form of utilitarianism which had no liberal dimension. The influence of Bentham and James Mill was thus cast in terms of an influence from which Mill liberated himself with the aid of new more sensitive, romantic and emotional guides. While there is no doubt that J.S.Mill made important changes to the older version of utilitarianism, the continuities are also important; furthermore the evidence of change does not itself indicate improvement. Given Bentham's ambition to change the world through the power of enlightened law and thus liberate people from the constraints placed on them by the power of sinister interests, and given John Stuart's different agenda to liberate them through the improvement of their characters, perhaps comparison is a misconceived exercise. If it is allowed, who is to say that Bentham's massive but modest practical enterprise is inferior to the grander but more elusive project which animated J.S. Mill? Into this picture James Mill constantly strays, exhibiting at times the practical optimism of Bentham and at other times a sterner pessimism about the possibility of improving character in a world beset with prejudice, ignorance and selfishness. Generally speaking, the older utilitarians took men (and women for Bentham) as they were and looked to laws as they might be, before considering society as it could be. For Bentham, and James Mill to a lesser extent, the strength of his position was that the changes recommended were all possible because tangible; they involved no change in human nature but only in the conditions in which men and women find themselves. All people want a happy life, a life of well-being, and it is politics which can assure them of the right context for such a very human ambition. From this standpoint Bentham never deviates, though James and John Stuart Mill are constantly worried by a more paternalistic concern with evaluating the happiness of the individual, a matter which Bentham is happy to leave to the individual to

decide.

In some ways the different interpretations given to utilitarianism were part of its strength as an enduring ethical principle. Thus for those concerned with matters of practical efficiency and reform it offered the possibility of empirical calculation of consequences, while for those concerned with the more spiritual improvement of mankind it offered a standard of qualitative judgement. Thus within the broad utilitarian perspective many versions persisted but all in some ways or other owed much to the classical formulation of Bentham either directly or through its modified transmission by James Mill.

CHAPTER 2
Whewell's philosophy of science and ethics

Struan Jacobs

ON SCIENCE

Introduction

Among the most prodigious of English minds of the nineteenth century, William Whewell (1794–1866) was at various times, and among other things, philosopher, intellectual historian, scientist, educationist, theologian, economist, student of Gothic architecture, classicist. 'Science is his [Whewell's] forte and omniscience his foible', quipped Sidney Smith. Born at Lancaster, son of a master-carpenter, Whewell won in 1812 an exhibition to Cambridge University whose most famous College—Trinity—he went on to serve continuously from 1817, initially as a Fellow then from 1841 as Master, to his untimely death from a riding accident.

Whewell was intellectually eminent in his lifetime, then his reputation went through a long eclipse. Interest in his work has, however, steadily increased over recent decades in an atmosphere more congenial to it, the intellectual shift—displacement of logical empiricism by historically informed philosophy of science—associated with Thomas Kuhn *(The Structure of Scientific Revolutions)* and others. Whewell believed, as now so many scholars believe, that the key to understanding the methods of science and the character of its knowledge lies in history, rather than in formal analysis of propositions and arguments.

Whewellian scholarship has tended to concentrate on those texts that Whewell himself took to be his most important, *The Philosophy of the Inductive Sciences* (1840 [2.3]) and its more concretely detailed companion, *History of the Inductive Sciences* (1837 [2.31]).[1] These were works for whose composition Whewell's extensive interest in science—crystallography, mineralogy, geology, mathematics, astronomy, physics, biology, tidology, political economy—equipped him superbly.

Historiography

Whewell produced his *History of the Inductive Sciences* concurrently with the *Philosophy*. He envisaged a relation between the two works such that the *History* would, besides providing a chronicle of scientific discoveries, empirically inform the other inquiry. Philosophical study of the methods by which truth in science is discovered requires to be, which to date it has not been Whewell claims, 'based upon a survey of the truths' already known to scientists ([2.1], 1:viii). In this respect Whewell sees the *History* as a work without precedent, as he does also in its 'point of view' or 'plan'.

According to Whewell's broad perspective, development of scientific disciplines typically involves 'preludes', 'inductive epochs', and 'sequels'. Certain disciplinary histories may reveal no epoch at all (thermotics, science of heat, for example); some are exhausted by a single case of the threefold sequence (about Newton's law of universal gravitation revolves the solitary epoch of physical or explanatory astronomy, and round the undulatory theory of Young and Fresnel turns that of physical optics); others show two or more of these cases (formal astronomy, covering astronomical relations as distinct from causes, with epochal figures in Hipparchus, Copernicus and Kepler).

How are inductive epochs, the periods chiefly constitutive of the history of science, identified by Whewell? Their most prominent feature is major intellectual breakthrough, achieved by the inductive method.

No epochal discovery is ever made 'suddenly and without preparation' ([2.1], 1:10). In the course of preludes, by invention of hypotheses and by analysis, ideas gain in clarity and facts in precision; materials needful for discovery are so prepared. Among 'imperfect, undeveloped, [and] unconfirmed' ([2.1], 2:370) preludial conjectures, some anticipate and 'touch' the great truths of epochs, as did Descartes' vortex theory relative to Newton's theory of gravity.

In sequels to inductive epochs champions of new theories overcome by argument defenders of traditional beliefs, winning over 'the wider throng of the secondary cultivators' ([2.1], 1:10). Implications of epochal discoveries are traced out, increasing their evidential support.

Emphasizing 'great discoveries' in the development of disciplines, their concepts and vocabularies undergoing significant change, Whewell may be said to work in the *History* with a concept of *scientific revolutions*. And the term itself is in evidence, Whewell noting the occurrence of 'revolutions' in 'the intellectual world' ([2.1] 1:9) and of 'revolutions in science' ([2.1], 3:114).[2] But his use of 'revolution' is attenuated, its xconnotation including continuity between successive scientific theories, which, with the fact that 'revolution' commonly signifies sudden sweeping change, may explain why Whewell is not at all times comfortable with the word. Discomfort, indeed denial, manifests in his remark that 'earlier truths are not expelled but absorbed, not contradicted but extended; and the history of each science, which may appear like a succession of revolutions, is, in reality, a series of developments' ([2.1], 1:8). There coexist in the science of Whewell's historiographic depiction an element each of evolution and revolution.[3]

From Whewell's account of scientific development as variations on the theme of prelude, epoch, sequel, one is not to infer it is his view that science has undergone continuous development. He actually finds in the 'history of human speculations' ([2.1], 1:11) times of stasis when science has languished. Book IV of *History of the Inductive Sciences* presents as the major case the Middle Ages or, in Whewell's phrase, the 'Stationary Period'. From the epoch of Hipparchus virtually to the time of Copernicus, science stood still. Inquiring into why this was so, Whewell notes how often during these one-and-a-half millenniums ideas were left indistinct, and how rarely were theories hauled before the tribunal of facts. These failures were results of deeper tendencies: rigid obeisance to intellectual authority, intolerance of dissent and an 'enthusiastic temper' subjecting 'the mind's operations to ideas altogether distorted and delusive' ([2.1], 1:81).

Ideas and perception

History of the Inductive Sciences covers one side of the development of science, the observational, *Philosophy of the Inductive Sciences* covering the other, the 'history of the Sciences so far as it depends on *Ideas*' ([2.1], 1:16). The *Philosophy* commences with a book on 'Ideas in General', books following on each of the better developed sciences: 'Pure Sciences' (mathematics), 'Mechanical Sciences', 'Chemistry', 'Morphology, including Crystallography', and the like. Such sciences impress Whewell as rich storehouses of 'unquestioned truths'. The second—theoretically much the more interesting—part of *Philosophy*, 'Of Knowledge', chiefly consists of Books XI to XIII: 'Of the Construction of Science', 'Review of Opinions on the Nature of Knowledge, and the Method of Seeking It', and 'Of Methods Employed in the Formation of Science'.

It is contended by Whewell that sciences rest on 'fundamental ideas', each science having one idea or some combination of ideas uniquely its own. The 'pure sciences' (of mathematics) are based on ideas of space, time and number; the 'mechanical sciences' on that of cause; 'palaetiological sciences' (historical sciences, including geology and biology) on historical cause. (An implication of this doctrine is denial of disciplinary reductionism. It excludes the possibility of a fundamental bedrock science, of whose laws those of other sciences are functions and from which deducible. Each science is for Whewell *sui generis*.) To the development of each science ideas contribute 'elements of truths'. Elements of another kind also play a part, which dualism is nowhere brought out more clearly by Whewell than in his account of perception. Analysing this will lead us into his philosophy of science.

Perception requires *sensory impressions* of shape, surface, colour, and movement. But there must be in perception materials besides these, for sensations are formless, evanescent, disconnected and without assignable boundaries, whereas perception is of enduring *objects* with specific properties, involved in definite relations. It is inferred by Whewell that mind is greatly involved, informing and fashioning the sensory flux.[4] Perception of objects with properties and in relations—discrete, spatially located, shaped, enduring, numbered, operated on by forces, resembling others—is the synthesis of sensory presentations and mental emanations. Impressions on senses by phenomena without are materials to which form is given by ideas within.[5] Sensations and ideas are one expression of that which Whewell describes as the *'fundamental antithesis'* of knowledge; elements which while mutually dependent are unlike in character and issue from opposite sources.

Innate to the mind and developed over time through its intercourse with the world are powers of forming fundamental ideas (space, time, number, likeness, causality, matter, force, substance, medium, symmetry and design) and of cognate conceptions. To exercise these powers is to organize in definite ways the otherwise shapeless flux of sensations, impregnating it with assumptions. The product of the process is conceptually informed material, sensations and ideas fused in perception.

Whewellian ideas are nothing like the mental images or objects of thought to be found in Descartes and Locke, but are close to Kant's 'forms of sensibility' (space and time). Whewell's account of mind and perception would appear to have been significantly

affected by Kant. True, Whewell ([2.6], 334–5) describes his 'main views' as 'very different from Kant's' (instancing Kant's denial of knowledge of noumena or things in themselves), but he admits in the same breath to having 'adopted some of Kant's views, or at least some of his arguments. The chapters…on the Ideas of Space and Time in the *Philosophy of the Inductive Sciences,* were almost literal translations of chapters in the *Kritik der Reinen Vernunft*'. 'Kant considers that Space and Time are conditions of perception, and hence sources of necessary and uni-versal truth' as indeed—except that he recognizes more of such 'conditions' and 'sources'—does Whewell ([2.6], 336).

Induction

Whewell's philosophy of science builds on the foregoing analysis of perception, elaborating the theme of the fundamental antithesis. The philosophy of science includes among its main components an account of induction as the process of scientific discovery, and standards for measuring which theories are true. The most accessible source of all this is Book XI, 'Of the Construction of Science', forming as Whewell ([2.3], 2:3–4) puts it the 'main subject' of *Philosophy of the Inductive Sciences,* all earlier chapters being in relation to it 'subordinate and preparatory'.[6]

The materials or 'conditions' of knowledge Whewell in opening his account of it explains are ideas and conceptions emanating from mind and—the other side of the antithesis—facts originating from observation and experiment. Scientific knowledge is expressed in 'exact and universal' propositions. It consists in the application of conceptions or ideas, distinct and 'appropriate' to some science (as is symmetry to morphology, force to mechanics, and vital power to physiology),[7] to numerous facts possessed of clarity and certainty.[8] A *system* of scientific knowledge is said by Whewell ([2.3], 2:3) to exist 'when, facts being thus included in exact and general propositions, such propositions are, in the same manner, included with equal rigour in propositions of a higher degree of generality; and these again in others of a still wider nature, so as to form a large and systematic whole'.

Necessary for achieving scientific knowledge are a twofold process of preparation—'explication of conceptions' and 'decomposition of facts'—and a method Whewell distinguishes as 'colligation'. Explication is undertaken to clarify conceptions and to gauge their suitability to research projects. (In the terminology of *History of the Inductive Sciences* it is 'preludial' work.) Controversy is prominent in this process. Vague and unfamiliar, new conceptions are objected to, placing on protagonists the onus of elucidation and integration. It is Whewell's judgement ([2.3], 2:8), a combination of 'whiggishness' and hindsight, that all controversies respecting scientific conceptions have ended in victory to 'the side on which the truth was found'. Under the broad heading of 'explication' Whewell also includes disclosure of necessary truths as inhering in ideas and functioning as presuppositions of sciences. Ideas must be clear before necessity in axioms can be discerned and their implications be traced out: 'the distinctness of the idea is necessary to a full apprehension of the truth of the axioms' ([2.2], 170).

As conceptions call for 'explication', in the other part of the process of preparing materials for discovery, facts have need of 'decomposition'. Facts properly decomposed are 'definite and certain…, free from obscurity and doubt' ([2.3], 2:26). Reduced to

simple elements and considered in regard to clear ideas and conceptions, experience may be rid of impurities—the likes of myth, prejudice and emotion. Among the original basis of decomposed facts for astronomy, for example, were the moon's recurrent phases, rising and setting points of the sun, and those regular intervals between which the same stars become visible at the same time of the year.

After explication and decomposition the way is clear for 'colligation' as the really creative work of science. By exercise of imagination, the scientist endeavours to hit upon a conception capable of expressing a 'precise connexion among the phenomena which are presented to our senses' ([2.3], 2:36). In the case of Kepler's third law, 'Squares of the periodic times of planets are proportional to the cubes of their mean distances from the sun', Whewell finds elementary facts about the planets' solar distances and durations of years colligated (literally, 'bound together') by such conceptions as squares of numbers and proportionality.

Explication, decomposition and, above all, colligation are the constructive elements forming *induction*, from which process Whewell ([2.3], 2:47) derives all *'real general knowledge'* of the world, by which he believes are discovered all laws of nature. Whewellian induction has little more than its name in common with the process traditionally so called. It is not generalization from facts but invention of an hypothesis using a new conception(s) or an old one(s) transposed from some other context; the hypothesis being superimposed on, so as to bring order to, facts hitherto not perceived as connected. Successful hypotheses depend on suitable conceptions, for invention of which there is no methodological rule, being fruit of sagacity and serendipity.

Whewellian induction also takes in negative testing of hypotheses to strike those out that are false. In coupling colligation with critique, Whewell presages by one hundred years in a most remarkable manner Karl Popper's image of science as 'conjectures and refutations'. Writes Whewell:

> This constant comparison of his [the scientist's] own conceptions and supposition with observed facts under all aspects, forms the leading employment of the discoverer: this candid and simple love of truth, which makes him willing to suppress the most favourite production of his own ingenuity as soon as it appears to be at variance with realities, constitutes the first characteristic of his temper.
>
> [2.3], 56–7).[9]

There is for scientists a temptation to cling on to hypotheses, setting their faces against empirical violations, and Whewell believes it helps explain the 'obloquy' into which hypotheses 'have fallen' ([2.3], 2:58). This detraction, and more so the misuse, Whewell regrets. When, however, science proceeds properly, an episode of invention and test continues for as long as it takes for an hypothesis to be framed to bind 'scattered facts into a single rule' ([2.3], 2:41). Whewell is able to find no clearer illustration of the process in the history of science than Kepler's successive invention and disposal of nineteen hypotheses (oval, combinations of epicycles, etc.) as he struggled to describe the orbit of Mars, which he eventually succeeded in doing through his colligation with the conception of ellipse.

John Stuart Mill, prominent among Whewell's adversaries, critically considered in *A System of Logic* Whewell's account of the case of Kepler. Mill did this under the heading 'Inductions Improperly So Called', indicating that to his mind what Whewell terms 'colligations' and identifies with inductions are strictly speaking not inductions at all. 'Induction' for Mill ([2.17], 288) 'is the process by which we conclude that what is true of certain individuals of a class is true of the whole class'. It is generalization, the inferring of general propositions, whereas by colligation he ([2.17], 292) understands 'mere description', there occurring no inference from, no going beyond, the facts.

That which Mill ([2.17], 297) identifies as the 'fundamental difference' between Whewell and himself over how Kepler should be interpreted centres on whether the ellipse colligation was logically equivalent to, only a description of, Kepler's experience. Mill ([2.17], 295) demurs to Whewell's suggestion that Kepler '*put* what he had conceived into the facts'. In Mill's account, having the concept of ellipse, Kepler considered whether observed positions of Mars were consistent with an elliptical orbit, and realized they were. 'But this fact, which Kepler did not add to, but found in, the motions of the planet…was the very fact, the separate parts of which had been separately observed; it was the sum of the different observations' ([2.17], 297).

So far as implications for his own philosophy of science are concerned, Mill, if I may digress to note a most interesting historical fact, devotes undue attention to the lesser of two associated problems. Let us put to one side whether Kepler's third law is no more than a description, and focus on the fact that descriptions do not exhaust Whewell's class of colligations. Universal propositions happen also, even more so, to be included and these, going beyond the facts, are by Mill's standards generalizations not descriptions. Mill ([2.17], 297) unreservedly agrees with Whewell that the 'tentative method' of trying conceptions is 'indispensable as a means to the colligation of facts for purposes of description'. To be true to his inductive philosophy Mill must now restrict Whewell's hypothetical or conjectural method to colligation in the restrictive (Millian) sense, ascribing to induction (generalization) all universal propositions of science. But this he fails consistently to do. Ultimately he wishes also to admit hypothesizing as a further source of general propositions. So it is one finds in Mill's *System of Logic* two philosophies of science: one in essence inductive, the other hypothetical. Of Mill's recognition and comprehension of this second method Whewell, as I have elsewhere argued, was almost certainly an important source ([2.15]; [2.16], 128–32).

Consilience

Whewell considers that scientific hypotheses are susceptible of proof, which is a major difference from Popper in whose view they are falsifiable only. We may conveniently denominate Whewell's conditions of proof as 'static success' and 'progressive success'. Each condition is required, and the two together are sufficient, for proof.

An hypothesis is advanced to explain some property or behaviour of the members of a class of phenomena. The 'static' condition of proof demands of a theory successful predictions of facts of the same nature within its subject class. The condition is minimal and non-definitive, being always satisfied by true, as well as sometimes by false, theories. While the theory of Ptolemy accurately predicted planetary positions along with solar and

lunar eclipses, eventually it was judged an inaccurate representation of the structure of the heavens. Is the achievement of any so-far predictively successful theory ever sufficient to insure it against refutation later on? In Whewell's other condition of success lies the answer, and it we see is affirmative.

Whewell notices two forms of 'progressive' explanatory success ('successive generalization' being his term for it). One concerns theories to which hypotheses are added. It may be the case that the hypotheses successively '*tend to simplicity* and harmony;…the system…[becoming] more coherent as it is further extended'. Observes Whewell ([2.3], 2:68), 'The elements…we require for explaining a new class of facts are already contained in our system', and for him this amounts to an infallible sign of truth. His prize example is the addition to Newton's theory of suppositions of: the sun's *attraction* to satellites to account for the motions of the aphelia and nodes; mutual *attraction* of planets to account for perturbations; *attraction* between earth, sun, and moon to account for tides, for the earth's spheroidal form, and for precession. The pattern is unmistakably that of progressive simplification, says Whewell ([2.3], 2:70), several hypotheses resolving 'themselves into the single one, of…universal gravitation'. In cases of the opposite kind, being historically the more numerous, assumptions happen neither to be suggested by nor to be reconcilable with theories to which they are appended. To Descartes' vortex theory were added hypotheses to explain elliptical planetary and lunar orbits, perturbations, and earth's gravitation. But they were independent, arbitrary, and *ad hoc*, and brought the theory into disrepute. By scientists using it to account for weights of chemical compounds, phlogiston theory was supplemented with, to the detriment of its credibility, the barely coherent notion that phlogiston is an element at once heavy and light, which upon entering compounds serves to reduce their weight. *Ad hoc* assumptions are to Whewell a sure sign of false theories.

The other form of 'progressive' success is *'consilience of inductions'*. This is achieved when a theory T ('All *Cs* have property *H*'), advanced to causally explain a confirmed generalization *L1* ('All *P1*s have property *A*'), is later discovered also to give a successful explanation of a confirmed law about a class of phenomena, L2 ('All *P2*s have property *B*'), *different* from that for which it was framed.[10] *T* is advanced to explain *L1* on the assumption that *P1*s are *C*s. T's explanation is confirmed if, in testing P1s in various circumstances, *H* is found to cause property *A*. This is the 'static' condition above. If—the salient characteristic of consilience of inductions—theory T is successfully applied beyond its intended domain to an (originally) *unintended* domain, such that *H* is shown to cause property *B*, it follows that *P2*s, like *P1*s, are members of the class of *C*s.

'Static' and 'progressive' success together, Whewell says, 'irresistibly' establish a theory's truth. As Whewell uses the same theories to illustrate both types of 'progressive' explanatory success, the thought occurs that perhaps his 'consilience' and 'progressive simplification' are different names for a single process. In the words of one commentator:

> Actually however, Whewell was not that sure that… simplification is all that different from a consilience. If we get a consilience, then one hypothesis is being used to explain facts from two different classes. And this, in a sense, is what simplicity is all about, for we are using a minimum to explain a maximum.
>
> ([2.19], 231)

It is clear from what Whewell says that scientists can never hope to induce (generalize) theories and laws from others already established. Conception is unpredictable; imagination strikes out in different direc-tions. Progressive cognitive expansion is none the less suggested. While no one knows in advance how to explain established laws, a new theory is required deductively to so do as a condition of its acceptance. A successful Whewellian scientific discipline resembles in the manner of its growth the construction in layers (theories) of an inverted triangle from apex to base. Explanation is in the opposite direction, deductively descending.

Suffice in closing this section to note that Whewell's paradigm cases of progressive explanatory success—universal gravity and the undulatory theory of light—physicists came in the fullness of time to judge as false. There seems nothing for it but to say Whewell fails to establish a criterion of proof: predictive successes, no matter how outstanding, are no indicator of future performance of theories.

Necessity

Whewell's writings on necessity as a property of (at least some) scientific theories would appear to have given rise to greater interpretative disagreement than has his treatment of any other topic. It will be shown that he theorizes the property in more than one way, which fact, not widely appreciated, may help explain the variety of interpretation. Whewell first addressed necessity in a paper 'On the Nature of the Truth of Laws of Motion' (1834), included later in *Philosophy of the Inductive Sciences*. Focusing on mechanics, science of 'motions as determined by their causes, namely, forces' ([2.3], 2:574), Whewell identifies three necessary axioms: *'Every change is produced by a cause'; 'Causes are measured by their effects';* and *'Action is always accompanied by an equal and opposite Reaction'* ([2.3], 2:574–6). Newton's laws of motion are respectively related to the axioms, the first axiom applied to motion yielding the first law, 'when no force acts, the properties of the motion [direction and velocity] will be constant' ([2.3], 2:577), and so on. In the same essay Whewell distinguishes each law of motion into 'necessary' and 'empirical' parts. The first law, continuing here with the same example for ease of exposition, in its necessary part affirms that 'Velocity [as a property of motion] does not change without a cause', the empirical part affirming that 'The time for which a body has already been in motion is not a cause of change of velocity' ([2.3], 2:591). In what for Whewell consists the 'necessity' of the axioms and laws of motion? He describes the 'necessary' parts of the laws of motion, and, by implication, the axioms from which they derive, as 'inapplicable'. But this adjective, suggesting analytic necessity, is not a happy choice, seeing that Whewell goes on to describe the axioms not only as 'absolutely and universally true' and expressive of 'absolute convictions' but as serving also to regulate *our experience*. When 'looking at a series of occurrences…we inevitably and unconsciously assume' the axioms' truth, for experience we we are unable to 'conceive otherwise' ([2.3], 2:575).[11] Axioms being necessarily true of, and indispensable to the reception of, experience, so must be the necessary element in each law of motion. Each such element makes a true, albeit highly general, assertion about the world. While the first law of motion *truly asserts* that change of velocity requires a cause, it is silent on what kind of causation is involved (inherent or extrinsic?) and is on this

level, as Whewell would have it, 'inapplicable'. It is *a posteriori* that we find out that the causation in question is external, not an inner power. The kind of necessity of which Whewell ([2.3], 2:593) here speaks is instructive and, at the same time, strictly universal (the 'all possible worlds' variety) for the necessary part of a law of motion cannot 'be denied without a self-contradiction'. The axioms of mechanics and the non-'empirical' (read non-'contingent') part of each law of motion appear in Whewell's 1834 essay as synthetic-necessary truths.

In *Philosophy of the Inductive Sciences* the analysis of necessity is along broadly similar lines except that the doctrine of ideas is now brought into play. Mechanical sciences in general rest on the idea of cause and its modes or conceptions of *force* (mechanical cause) and *matter* (resistance to force), with the special branch of 'dynamics' depending on the axioms of cause and the laws of motion. What the 1834 essay presents as axioms *simpliciter* in *Philosophy* appear as axioms grounded in and expressing the idea of cause. The axioms are described as 'true independently of experience', meaning *a priori,* and as true 'beyond the limits of experience', meaning necessary and synthetic. That the truth of axioms is 'necessary' in the robust sense of that word is evident from the imperative mood of the first axiom: *'Every Event must have a Cause'* ([2.3], 2:452). To laws of motion also necessity is ascribed, yet they are said to have been 'collected from experience' ([2.3], 1:247; [2.3], 2:453). The air of contradiction that surrounds this combination of claims Whewell dispels by noting in each law the presence of a non-necessary element, the *content* being true but only contingently so. It is their universality and vocabulary ('cause', 'effect', 'action', 'reaction', etc.), in a word their 'form', in virtue of which the laws 'exemplify' the corresponding axioms, and in which their necessity consists. Laws so formed Whewell ([2.3], 1:249) regards as necessary in yet another way, drawing attention to an 'indestructible conviction, belonging to man's speculative nature' that there are laws of motion, 'universal formulae, connecting the causes and effects when motion takes place'.

P*hilosophy of the Inductive Sciences,* in that part of the third edition titled *Philosophy of Discovery,* presents knowledge of necessary truth as 'progressive', Whewell largely devoting himself to making sense of this fact. Part of his explanation is that necessary truth proves accessible only to minds properly prepared. 'To see the truth and necessity of geometrical axioms, we need geometrical culture' ([2.6], 347), just as necessity in axioms of mechanics remains opaque until, their discipline developed, scientists acquire the right culture. While scientific disciplines (mechanics, chemistry, geometry, and the like) could never have been raised other than on the basis of axioms, 'internal conditions' of experience and knowledge as Whewell calls them, the knowledge that axioms are necessary truths is acquired later.

Whewell goes on to claim that in (but not only in) mechanics, his exemplar of excellent physical science, axioms encapsulate 'in a manner' the science in its entirety. 'The whole science of Mechanics is only the development of the Axioms concerning action and reaction, and concerning cause and its measures' ([2.6], 357). For this bold claim Whewell offers no effective support;[12] his present interests not including analysis and defence of his doctrine of necessity.

It has been indicated above that 'Laws of Motion' and *Philosophy of the Inductive Sciences* both treat the axioms of mechanics as wholly necessary and the laws of motion

as necessary in form and contingent in content. In that account the laws are not deducible from axioms. By implication, there being in what Whewell says nothing to suggest otherwise, the distinction between necessary and non-necessary truth is an ontological and absolute one, based on objective properties.[13] But *Philosophy of Discovery* presents a different doctrine altogether. As the entire science of mechanics is able to be exfoliated from axioms (once the laws are discovered), the distinction between truths necessary and truths non-necessary in mechanics must in this case be drawn only *relative to* the state of knowledge (level of cultivation), all truths of mechanics in reality being, and eventually recognized as being, necessary.

As noted, Whewell on the subject of necessity in *Philosophy of Discovery* wants specifically to explain the progressiveness of knowledge of necessity: how propositions whose truth is in the first instance known *a posteriori* come to be known *a priori* (as necessarily true). His explanation in its first part revolves around development of disciplines and cultivation of minds. Its second part presents the proposition that structural identity must exist between mind and the world. Ideas exist in God's mind, and these he has impregnated in the human mind as well as constituting the world according to them. Consequences of ideas in the world are laws of nature, which coincide with consquences of ideas in the mind (propositions), consequences of both descriptions being necessary. This same general view Whewell in *Philosophy of Discovery* extends to ethics, postulating the existence of ethical ideas that coincide with ideas in God's mind. We now turn to Whewell's ethical doctrines.

ON ETHICS

Introduction

Whewell has been credited with having revived in the nineteenth century 'the study of moral philosophy at Cambridge', being at the head of an impressive 'line of Cambridge moralists—John Grote, Henry Sidgwick, G.E.Moore, C.D.Broad—whose outlook, despite important differences, is strikingly similar on certain central issues' ([2.21], 109). Their historical importance notwithstanding, Whewell's ethical works have in the twentieth century been almost entirely neglected.[14]

Whewell began publishing on ethics in 1836 with a 'Preface' to James Mackintosh's *Dissertation on The Progress of Ethical Philosophy*. *On the Foundations of Morals, Four Sermons* appeared in 1837. The following year, appointed Knightbridge Professor of Moral Philosophy (his second chair, that of Mineralogy having been held by him from 1828 to 1832), Whewell delivered twelve lectures which later appeared as *Lectures on the History of Moral Philosophy in England* (1852, [2.5]). Certain themes of these lectures form a backdrop to the *opus magnum* of Whewell the moralist, *Elements of Morality, including Polity* (1845, [2.4]).

The leitmotif of *Lectures on the History of Moral Philosophy in England* is the history of conflicting understandings of the foundations of morals, the basic principles of duty or right conduct. Theories of one class, distinguished by Whewell as 'high' or 'independent', explain conduct as moral or immoral *per se*, right and wrong being

independent (inherent) qualities of actions. According on the other hand to the theories Whewell designates as ‘low’ (the adjective serving to make plain his antipathy), morality is reducible to facts more fundamental and real. The facts in question are consequences of actions, notably pleasure and pain. The debate between theorists of these two proclivities arose in ancient Greece, Stoics pitted against Epicureans. Woven through Christian moralizing, the independent perspective was long ascendant, up to the seventeenth century in fact. Then, at the same time as Hobbes and Locke were forcefully asserting the low view of morality, developments in science and metaphysics were straining and breaking the web of traditional belief. The high position began to look anachronistic, fewer people found it credible. For a new age, in a new climate of opinion, the independent doctrine had to be appropriately reformulated. And while attempts have been made to adapt it to the altered circumstances, they have only been partial and never really satisfactory. So far as Whewell is concerned, the real work of reconstruction remains to be done.

From the early eighteenth century, in England generally and at Cambridge University in particular, dependent theorizing on morality formed ‘the general tendency’ ([2.5], 165). Since the middle of that century, the successive main sources of the ethical instruction given at Cambridge have been Gay, Rutherforth and William Paley. Gay’s *Dissertation* (1732) affirms God’s will as the determinant of virtue, and human happiness the measure. On any occasion the action productive of greatest happiness is that which God would have us perform. In *Essay on the Nature and Obligations of Virtue* (1744) Rutherforth attempts to show that happiness as the ultimate end of action is a teaching of reason, with revelation the source of our knowledge that God will reward with happiness in the next life right conduct towards others in this. The major production of Paley was *Principles of Morals and Politics* (1785). Such has been its intellectual impact, Whewell puts it in another league altogether from the last mentioned works. Radiating influence far beyond the walls of Cambridge colleges, Paley affected ‘the habits of thinking, reasoning and expression’ of English people ‘to at least as great an extent as any previous moral doctrine has ever done’ ([2.5], 176–7). The central teaching of Paley is that happiness for humanity is desired by God, by whom those of our actions that conduce to happiness are deemed right and to whom they prove agreeable. We may know God’s will so Paley reasons, and reasoning thus he is close to Gay, by determining which actions achieve most happiness for all concerned. There is for Whewell sad irony about Paley’s labours; of noble intentions and impeccable religiosity, his thought was a major antecedent of secularized utilitarianism. Little did he, and profoundly would it have aggrieved him to, know that his writings would in time ‘lead to dangerous and immoral tenets’ and ‘produce…evil’ ([2.5], 178). Whewell expresses in *History of Moral Philosophy* a resolve to deal with the problem as he recognizes it, seeking reform of the Cambridge curriculum. The ‘system of [Paleyian] morals which is now taught among us is unworthy of our descent and office; and it will be my endeavour in future years… further to point out, and, if possible, to remedy the defects which I lament’ ([2.5], 184). He was as good as his word. Whewell’s ethical ‘writings became text-books at Cambridge, and were naturally studied by young men reading for Trinity fellowships’ ([2.24], 1371).

The reader of *History of Moral Philosophy* catches glimpses of some of the likely

sources of influence on Whewell's constructive ethical thought. Grotius, Pufendorf and Cumberland are approved of for having recognized in human nature principles besides self-interest. He accepts Butler's proposition that 'The proper office of each of the principles of our nature assists us…to determine their limits, and to lay down rules for their direction, control, or restraint', rules that is for framing 'special moral duties', although he can nowhere find in Butler a satisfactory 'classification of the faculties and operations of the human mind' ([2.5], 112). And with Paley, Whewell ([2.5], 166) is able to agree on at least this: the task of the moralist must include deductive ordering of 'the commonly-received rules of morality'. This leads on to Whewell's constructive doctrine.

Rational morality in context

The diverse materials of *Elements of Morality* are sorted into six books: '*Introduction*. Elementary Notions and Definitions', '*Morality*. Of Virtues and Duties', '*Religion*. Of Divine Laws and their Sanction', '*Jus*. Of Rights and Obligations', '*Polity*. The Duties of the State' ('*Jus'* treating law as it is, '*Polity'* law as it ought to be), and '*International Jus*. Rights and Obligations Between States'. In its final (fourth) edition, the main body of the work runs to around 550 pages, with its longer books, *'Morality'* and *'Polity'*, in the order of 200 and 130 pages respectively. There are two senses of 'morality' to be noticed in the titles. In that of the volume it connotes the five provinces of human conduct and rules, of which each, while 'intimately connected', has its own questions and modes of answering them. In the case of reasoned 'Virtues and Duties' (Book II), 'morality' signifies the primary part of the whole.

E*lements of Morality* is a work of conservative intent. It is not designed to add to the first-order ethical knowledge we have already (which Whewell takes to be considerable), nor to inquire into how such knowledge is obtained—Whewell supposing himself to keep to the bare essentials. Whewell ([24], x) wrote the *Elements* principally to bring method to bear on what we know about how we ought to act, 'to construct a [moral] *system*'.[15] Our knowledge of rules, duties and virtues is seen as demonstrable by stepwise deductions. The purely ethical part of the system, rational morality comprising Book II, is based by Whewell on the supreme rule of human action or of 'human nature', which notion, as 'universal standard' of right, is redolent of natural law. From this supreme rule of reason lesser moral rules are drawn, each conveying some part of its content.

'Moral Rules Exist Necessarily' Whewell titles one of the chapters in the first book of the *Elements*, and it is a statement that underlies his explication of basic concepts. The predicate 'right' describes con-formity of action to rule. Rules indicate by what actions objects of designated classes may be properly attained. 'Labour, that you may gain money' prescribes labouring as 'the *right* way to gain' that object ([2.4], 48). Rules gain validity, and objects value, from superior cases. 'The Rule, *to labour*, derives its force from the Rule, *to seek gain*' ([2.4], 48). In the same way, it is suggested, rules receive reasons: Why should I labour? To earn income to maintain myself and dependants. Climbing the scale eventually one comes upon an object of intrinsic value, source of value in all other objects. The chain of reasons must if valid likewise have a terminus, one rule exerting sway. So it is that Whewell settles to his own satisfaction the existence of the supreme rule and supreme good.

In utilitarianism is recognized by Whewell the main alternative interpretation of ‘right’ and cognate moral terms. He argues against it that pursuit of rightness is distinct from and apt to conflict with wanting to maximize pleasure, and in cases of conflict it is rightness every time that makes the stronger claim on us. To assess an action accurately as right is to provide for its performance a reason, writes Whewell: ‘*paramount* to all other considerations. If the action be right, it is no valid reason against doing it, that it is unpleasant or dangerous. We are not to do what is pleasant and wrong. We are to do what is unpleasant if it be right’ ([2.4], 6). ‘Right’ is in ethics an absolute term implying a supreme rule as the ultimate reason for action: above all we are to act rightly.[16]

Whewell’s supreme rule extends beyond morality in the ordinary acceptation of the word. All feelings and conduct are regulated by it, ‘all intercourse of men, all institutions of society’ ([2.4], 77). Rules acquire the property of rightness from expressing portions of the supreme rule of action, but whether Whewell regards as its components all rules that have a defensible claim on conduct is uncertain. He distinguishes moral rules from prudential, but by his ([2.4], 139) description of the latter as ‘not directly moral’ a connection with the supreme rule is not necessarily excluded. What is clear however and for Whewell’s purposes more important is that *laws* are part of the supreme rule’s content no less than are moral precepts. These are respectively characterized as ‘Rules of external [bodily] action’ and rules of internal action or events—‘Will and Intention,… Desires and Affections’ ([2.4] 68)—which form ‘the only really human part of actions’ ([2.4], 66).[17] Laws create rights and correlative obligations; precepts impose duties.

While ‘Every thing is *right* which is conformable to the Supreme Rule of human action’ ([2.4], 54), on another level there exist what Whewell identifies as ‘national’ moralities. ‘Nations and communities…have their Standards of right and wrong’, including positive laws and ‘current moral Precepts and Rules’ ([2.4], 199).

From so devout a Christian as was Whewell (Anglican clergyman, doctor of divinity and theologian) it comes as no surprise to learn that ethics is religiously embedded. Natural religion furnishes the idea of the course of nature as in harmony with, as subject to, divine moral government. God governs by laws he wills, that of which in human affairs is foremost being the selfsame supreme rule. Endowed with reason as part of the divine providence individuals are able to, and of course should, act conformably to the divine laws.

> The Supreme Rule of Human Action derives its Real Authority, and its actual force, from its being the Law of God, the Creator of Man. The Reason for doing what is absolutely right, is, that it is the Will of God, through which the condition and destination of man are what they are.
>
> ([2.4], 141)

By God’s appointment, violation of his moral laws is punishable by misery, and conformity rewardable with happiness. The apportionment, taking place in the next life, serves to complete the divine ‘moral government’, God determining the final, eternal condition of the soul according to the level of its moral progress when embodied.

The ‘history of the world’ recorded in the Scriptures Whewell presumes to be the ‘fact’ corresponding to the ‘idea’ just noted. The part of the Scriptural record of chief

importance concerns God's transactions with humanity, '*Revelations* of the Commands and Promises of God, and of the Methods by which men are to be enabled to obey these Commands, and to receive the benefit of these promises' ([2.4], 257). The revelation made through Jesus Christ confirms the claims of natural theology.

Through the addition of Christian precepts and doctrines to those of rational ethics we are offered, Whewell believes, a more complete picture of the grounds of duty, providing for virtue's more effective pursuit. Christ embodied in human form the moral perfection we conceive in God, and Christian morality presents this *'Image of God in Christ'* as the 'summit of the Moral Progress, which it is our Duty to pursue' ([2.4], 258). It is important to our hopes and aspirations, and to the way we conduct our lives, that we know whether sinners may be saved from eternal punishment. The answer, to be found in revealed Christian doctrine, is that Christ's crucifixion, burial and ascent into heaven formed a divine interposition to save humanity from 'infliction of merited punishment' ([2.4], 259). Conditions are revealed as necessary to fit the soul for future life: belief in Christ ensures participation in the Holy Spirit, and united with Christ the soul receives its aliment.

Law and morality

Leslie Stephen ([2.24], 1372) has described as 'The most curious characteristic' of Whewell's ethical writings 'the prominence given to positive law in the deduction of moral principles'. It is possible to understand Whewell's ethics only after studying how he relates law to morality, and this requires the disentanglement of a number of threads in his work.

Of Whewell's claims on this subject perhaps the most prominent is that *morality depends on law*. He opens with an argument that mental desires, our 'most powerful' springs of action, can be gratified only if regulated, and on their gratification preservation of the fabric of society depends. Whewell ([2.4], 45–6) in the first instance describes these rules as 'moral'. This it may be thought is in conflict with the basic dependence relation: *'that Moral Rules may exist, Men must have Rights'*, where 'rights' signifies abstract conceptions assigned to people by positive laws that are 'subordinate to the Supreme Rule' ([2.4], 51). But upon inspection the conflict turns out to be verbal only, apparent rather than real. 'Moral' is in the first sense inclusive of, and used in such a way as to highlight, laws as a type of moral rules, having in the second its usual, more restricted, meaning. At least three claims may be distinguished. There is a thesis, call it 'causal', about the possibility of moral conduct: people cannot act morally unless already they obey positive laws. Moral conduct and character presuppose legally ordered society. There is a closely related ontological claim about the possibility of moral rules: 'We must suppose the Rights of Property, and the Laws of Property, before we can lay down the Moral Rules, Do not steal, or Do not covet another man's Property', etc. ([2.4], 55). A further claim, this made in regard to morality's vocabulary, is that 'Desires and Intentions cannot be defined or described in any way, without some reference to Things and Actions; and therefore, cannot supply a basis of Morality independent of Law' ([2.4], 201). Without him saying it in so many words, the precedence of law for Whewell really boils down to it enabling mental desires to be satisfied. More than moral rules, suggests

Whewell, laws are directly concerned with constraining conduct and, being enforced, usually succeed in this.

Whewell's follow-up to this is a rather more informative statement that duties (morality) depend upon rights, not in general but of a *specific class*. What 'Rights must exist' are determined by—a common expression in eighteenth- and nineteenth-century philosophical writing—*springs of action* ([2.4], vii).[18]

Acts Whewell believes are properly ours when reason directs the will. Through the faculty of reason we discover truth and falsehood, conceive of general rules, recognize actions as cases of rules, and discriminate right from wrong.[19]

Will represents the final step of intention (purpose), a process of internal motion as Whewell conceives it, produced by springs of action. Springs of action he distinguishes by their ends. Bodily desires for physical objects are *appetites*, primordial among which are 'natural wants' (hunger, thirst). Satisfaction of wants is a source of enjoyment, giving rise to the desire of *pleasures of sense*. Employment of art to satisfy appetites stimulates *artificial wants*. As appetites are directed to things, *affections* (love and anger) tend to people. Most 'universal and most powerful' ([2.4], 32) among springs of action are *mental desires* for abstract conceptions of physical safety, private property, companionship of family and membership of civil society, kept promises and respected agreements ('mutual understanding'), 'superiority' (skill, strength, wealth, or power), and 'knowledge' or reason. *Moral sentiments* (approval, esteem, and their opposites) accompany moral evaluations of actions, disposing us to treat people 'as we approve or disapprove their actions' ([2.4], 41). *Reflex sentiments* are the desire that others would love and esteem us; and desire of honour, fame and self-approval.

From mental desires as the predominant springs of action Whewell derives fundamental rights. To have a satisfactory life each person is in need of: protection from assault (right of person), control over physical objects (right of property), dependable conduct from others (right of contract), exclusive relations with certain others (family rights), and an organization to establish rights (rights of government). The rights are to objects of mental desires. (In *'Jus'*, Book IV of the *Elements*, rights in Roman and English systems of law receive extensive classification under the foregoing heads.)

These 'primary and universal' rights Whewell respects as absolutely valid, imperatives in all societies. They are rights that *must be*. 'Family Rights', as a case in point, 'necessarily exist'; while society without 'Rights of Government…loses its social character; and the moral character of man cannot find its sphere of action', and so on ([2.4], 52). The most important objects in our lives, those of primary (mental) desires, cannot be secured outside a framework of law. Rights respected are realities; abstract conceptions as objects are thus realized.

As we have so far understood Whewell in this part of his thought, his essential theses are two. There is a set of *ideal* rights corresponding to springs of action. The same rights serve in *fact* as the indispensable conditions of social order and morality.

To this conjunction an objection immediately suggests itself: Is not the proposition that ideal rights necessarily exist contradicted by the variety of laws and rights found both within (temporally) and between societies? The objection is one that Whewell ([2.4], 59) himself anticipates in order to obviate, claiming the positions to be 'reconcilable'. In this reconcilableness he sees a further case of the fundamental antithesis or distinction

between *ideas* (conceptions) and *facts*. Ideas of the primary rights are derivations from human nature. There can be no conceiving of people as members of society nor as moral agents except in so far as they have the (ideal) rights to personal safety, property, etc. That said, ideas of rights must be in society as facts. By positive laws the forms so to speak are specifically defined and, on account of being historically conditioned, the definitions of ideas of rights differ between societies. The traveller whom law in one society permits to 'pluck the fruits of the earth as he passes' finds such fruits are in another society 'the Property of him on whose field they grew'. Explains Whewell ([2.4], 59), the 'Precept, *Do not steal'* is absolutely moral and 'universal', a corollary of primary rights, whereas 'the Law, *To pluck is to steal*', is historically contingent or 'partial'. According to the present thesis *actual rights (in 'national moralities') are in all cases definitions of, and consistent with, the rights identified as ideal*.

Appearing in *Elements of Morality* is a further account of rights positive in relation to rights ideal, almost certainly contradicting the account above. In a passage that merits quoting at length we have Whewell (1864:68) saying:

> positive definitions of Rights for the moment, may be themselves immoral. Rights, as we have described them…, are arrangements not only historically established, but also established in conformity with the supreme Rule; that is, they are such as are right. The actual definitions of Rights at any moment, that is, the state of the Law, may need improvement and reform: but in general, the Law gives, for the moment, the definitions of Rights upon which Morality must proceed.[20]

Actual rights may be immoral, contradicting ideal rights. So, while *positive rights* should, the fact is they *do not, in all cases assign definite shape to some part or other of the content of ideal rights*.[21]

From his case for morality requiring a specific set of rights Whewell has veered away, apparently unaware of how damaging to his basic doctrine are the implications of such change. Societies may produce, and their 'national' moralities may exist on, immoral rights, conflicting with the ideal or 'primary' rights and failing to gratify primary desires.

Closing coverage of this part of *Elements of Morality* it may be commented that Whewell's procedure—grounding ideal rights in human nature—appears strange given his inclusion of the same rights in the supreme rule. To this, the first and fundamental principle of morality, he might have been expected to go and exfoliate the ideal rights directly.[22]

Rational morality

In '*Morality*. Of Virtues and Duties' we confront the longest and most important of the *Elements*' six books. The core of this as of the other parts of Whewell's ethical thought is the 'supreme rule' coupled with the 'supreme object'. These points have been noted. Whewell early in Book II equates the idea of the supreme object with moral goodness, to which he otherwise refers as virtue or rightness in the soul. The soul attains this state when the faculties (consciousness, reason, will, imagination, and affections) are regulated

by virtue and habituated to duty. The supreme object—goodness or virtue—Whewell ([2.4], 241) also designates as happiness, which he specifically says stands for 'the Supreme Object of our Desires' and is 'identical with…the Ultimate and Supreme Guide of our Intentions'. Utilitarians have commonly equated happiness with pleasure, demonstrating to Whewell ([2.4], 254) how confused they are, for in happiness is a compound of 'all other objects', whereas pleasure is only that *simple* state we experience upon the satisfaction of our physical desires. The doctrine of absolutely right action (as action in accordance with the supreme rule) denies that pleasure can be, while confirming that happiness is, the ultimate desire and end.

> The Desire of Happiness is the Supreme Desire. All other Desires, of Pleasure, Wealth, Power, Fame, are included in this, and are subordinate to it. We may make other objects our ultimate objects; but we can do so, only by identifying them with this.
>
> ([2.4], 241)[23]

No doubt some utilitarians would approve of this, and imagine that Whewell on account of it might be counted as one of them. But although Whewell takes it as true that happiness ought to be increased, he goes on to suggest that there is no possibility of anyone knowing how to go about it. A basket, or if you like an umbrella, concept, no 'special element' is implied in happiness while 'all…objects' and 'all good' are ([2.4], 243). As happiness, Whewell says, is too complex and indeterminate to be measurable, rules for attaining it are out of the question. Whereupon the possibility of Whewell's project of arranging existing rules-and-objects hierarchically boils down to this: there must be some other way, more fertile of implications, in which to envisage the supreme object.

Whewell for his part typically discusses this object with reference to, and in such a way as to identify it with, 'goodness', reducing it to five terms—benevolence, justice, truth, purity and order—each with subjective and objective denotations. Subjectively they refer to classes of dispositions or 'cardinal virtues', and objectively to 'abstract mental Objects or Ideas' ([2.4], 75–6) to which dispositional desires and affections are directed. *Benevolence* as virtue is the sum of all affections that bring together people, and the absence of feelings that divide; of which the corresponding idea, 'humanity', is of the good or well-being of all people.[24] *Justice* as virtue is 'the Desire that each person should have his own' ([2.4], 73), and as idea or object is 'the Rule, To each his own' ([2.4], 76). *Truth* as virtue or disposition has as its idea '*Objective Truth*, the agreement between the reality of things and our expressed conceptions of them' ([2.4], 76). In the state of *purity* reason and moral sentiments govern bodily desires, the objective counterpart consisting in the idea of human nature 'free from…mere desire' ([2.4], 76). *Order* denotes the disposition to conform willingly to positive laws and moral rules and, objectively, the idea of obedience.

Goodness or virtue is the supreme object of action and of rules, subordinate objects all taking their moral value from it. Enjoining us to love virtue (benevolence, justice, etc.) and to seek it 'as the ultimate and only real object of action' ([2.4], 77), the supreme rule directs our 'Affections and Intentions to their proper objects' ([2.4], 96). Conforming to

this rule, *character* is virtuous and *action* dutiful, the twin elements serving to make a person good. The supreme rule is possessed of a structure which for the most part reflects its (supreme) object, with matching pairs—objective and subjective—of component rules. Conveying aspects of the supreme rule's content, *express* (objective) moral principles have objects in the form of ideas. The principles are those of humanity, *'Man is to be loved as Man';* justice, *'Each Man is to have his own';* truth, *'We must conform to the Universal Understanding among men which the use of Language implies',* desisting from lying; purity, *'The Lower parts of our Nature are to be governed by, and subservient to, the Higher';* and order, *'positive Laws [are to be obeyed] as the necessary Conditions of Morality'* ([2.4], 95–6). Completing the list of express principles are: earnestness, *'The Affections and Intentions must not only be rightly directed, but energetic';* and moral purpose, '*Things are to be sought universally,* not only in subservience to moral rules, but *as means to moral ends*' ([2.4], 96). The supreme rule's other set of principles Whewell distinguishes as 'operative'. These have to be cultivated; express principles being incorporated into the character of an individual habitually to guide affections and purposes, functioning as springs of action.

Specific virtues and duties, the bulk of the materials of rational morality, Whewell explicates in terms of, and distributes according to, the plan above. Virtues are a sub-class—those that are desirable—of the habits or dispositions of inner states (desires, affections and volitions), combining to form an agent's moral character. Duties are right actions, the ways in which we ought to conduct ourselves. Virtues exist and operate unconsciously, while duties are conscious. Between the two Whewell finds a relation approaching to concomitance. Duties need not issue from virtues (motives to right actions may be amoral, even immoral), but virtues are manifested in and developed by performance of duties, and by cultivation of virtues performance of corresponding duties is made more likely. 'Acts of Duty are both the most natural operation of virtuous Dispositions, and the most effectual mode of forming virtuous Habits' ([2.4], 97).

Distinguishing duties in relation to objects, Whewell's basic categorization of them is similar to that of cardinal virtues, with duties of affections (benevolence), property, truth, purity, and order. A duty of cultivating the affections is also recognized, reducible to which is a duty of the affections: the 'Duty of thus cultivating these Affections includes the Duty of possessing such affections' ([2.4], 115). It is unclear whether Whewell believes all duties owed to other people involve the duty of affection, but at least those of justice and truth in his view do.

From these primary duties, enjoined by the 'express' principles of morality, Whewell goes on to deduct rationally many specific rules of duty, but their enumeration shall not detain us. The general classification of duties reappears to shape discussion in other parts of *Elements.* The book *'Polity'* has chapters on the State's duties of 'Justice and Truth', 'Humanity', 'Purity' and 'Order'. Explicating religious ethics, Christian precepts are arranged by Whewell under such headings as 'Duties of the Affections', 'Property', 'Truth', 'Purity', 'Obedience and Command'.

One further duty to be noted is that of moral progress, incumbent on States and individuals alike. The State must be recognized as an agent given that it, among other things, 'makes war and peace, which it may do justly or unjustly; keeps Treaties, or breaks them; educates its children, or neglects them' ([2.4], 208). Continuously existing,

purposive and active, States are moral beings endowed with life, and ‘During this Life, it is their Duty to conform their being more and more to the Moral Ideas’ ([2.4], 208). By its duty of moral progress the State is obliged to acquire more virtue and to perform its duties better. It must become more just and act more justly (observe treaties with, and respect possessions of, other States; make laws that remedy inequalities from the past), become more benevolent and act more benevolently (liberate slaves, relieve poverty), and so on. What meaning is to be given to Whewell’s talk of the State as a subject of virtue, and of it being by the enhancement of its own virtue disposed to perform duties better? It seems probable he regards this virtue and its increase as a function of citizens:

> And, as the condition of other Duties being performed, the moral Education of its citizens, *and consequently of itself*, is a Duty of the State. It is its Duty to establish in the minds of its children, and to unfold more and more into constant and progressive operation, the Moral Ideas of Benevolence, Justice, Truth, Purity, and Order.
>
> ([2.4.], 208, emphasis added)

Correspondingly, to the individual is ascribed a ‘reflex’ duty of moral progress or of moral self-culture. The character should according to this duty be developed as far as possible towards the ideal centre of morality at which, the point of goodness, cardinal virtues represent tendencies (‘operative principles’) of conduct so firmly established that no duty can ever be transgressed. Among the requirements of this duty, *benevolent affections* of gratitude to benefactors, compassion to the afflicted and love between family members are to be made steadier and more earnest; the *malevolent feelings* of violent anger, peevishness and captiousness are to be suppressed. *Justice* is to be developed as an operative principle, the character being cleansed of stains of greed, covetousness, and partiality; the agent desiring only possessions to which she or he is entitled and only for moral purposes. The individual is likewise called on to foster the other virtues—truth, purity, order—while eliminating desires running contrary to them. ‘We have to form our character, so that these principles [benevolence, justice, truth, purity, and order] are its predominant features. We have to seek not only to *do*, but to *be;* not only to perform acts of Duty, but to become virtuous’ ([2.4], 142). The duty of moral progress is itself performed, just as the several virtues are most effectively cultivated, by performance of the other, more particular, duties. And in opposite fashion whenever temptations are succumbed to and rules of duty transgressed, when affections are malevolent and intentions fraudulent, moral progress ceases and the character goes down ‘a retrograde moral course’ ([2.4], 143).

While the present study of Whewell’s view of ethics has concentrated on that which he labels ‘rational morality’ as the truly distinctive, striking and substantial part of his teaching, it is as well to remind ourselves that this department depends for him in a most fundamental manner on religion. The cardinal virtues, as noted, are conceived of by Whewell as perfectly realized in God and as having had embodiment in human form in Christ. The supreme rule of rational morality is the rule of God which fact in conjunction with his imposition of sanctions provides the compelling reason for obeying it. The supreme rule as understood by Whewell

> derives its Real Authority, and its actual force, from its being the Law of God, the Creator of Man. The Reason for doing what is absolutely right, is, that it is the Will of God, through which the condition and destination of man are what they are.
>
> ([2.4], 141)

The rule commends to us, and commands us to emulate, the character of Jesus, moral progress having the goal of 'a godlike being and a heavenly life' ([2.4], x). On our success in following the supreme law and in making moral progress depends our prospect of happiness in this life and, more so, the next.

Postscript

It is natural to ask whether in its structure and method Whewell's analysis of morality resembles his philosophy of science. There is a difficulty to be faced, however, before answering this, the two main works in question, *Philosophy of the Inductive Sciences* and *Elements of Morality, including Polity*, each being predominantly on a different level from the other. Rehearsal of some basic distinctions will enable us to identify more clearly the source of the difficulty. Concerning the subject-matter of physical objects and processes (level 1), scientists advance prepositional laws and theories (level 2), with philosophers theorizing scientific practice and products (level 3). Whewell's *Philosophy* is a contribution on the third of these levels. The corresponding levels of ethics put simply are: human agents and actions, rules dictating how agents ought to conduct themselves, and meta-ethical theories of the discovery and evaluation of right rules. Most of *Elements of Morality* occupies the second level, systematizing occurrent rules, duties and virtues. Philosophical analysis of ethical knowledge and its methods is not its major concern. We are not altogether without material for comparison, Whewell producing some philosophy in the *Elements*, but for comparison to be full and rigorous more of such matter would be needed. We proceed bearing in mind this caveat.

Whewell himself ([2.5], 168) speaks confidently of the 'analogy between the progress of the science of Morals and other sciences'. Concepts and knowledge in both subjects form part of the flux of history. In *Elements of Morality* ([2.4], 202), for example, it is observed generally that 'As the intellectual culture of the nation proceeds, abstract words are used with more precision; and in consequence, the conceptions, designated by such words, grow clearer in men's minds'.

Whereas progress of scientific theories turns for Whewell on wider colligations, that of ethical rules is accounted for by him differently,[25] the key apparently being morality's interaction with law. Definitions that laws give of rights vary socially and historically, and the virtues and duties supported in society depend upon its laws. At the same time morality exercises authority over law and, as a nation's morality improves, laws should be and, Whewell it would appear believes, typically are brought into line. Exactly how improvement in morality is effected and how people have in the past been able to tell that morality was changing to the good are matters which in Whewell remain obscure. Perhaps Christianity's revealed morality has acted as both inspiration for and criterion of

improvement in national moralities. But whether (as I am inclined to believe) or not this speculation constitutes Whewell's opinion on the matter, the main point at the moment is that *Elements of Morality* has no doctrine corresponding to that of colligatory trial and error.

Whewell as explained sees a corpus of real moral knowledge having formed through history. It is to this knowledge, expressed in rules, that under the rubric of 'rational morality' he imparts systematic shape. The axioms employed by him to this end are, like those he locates in science, understood by Whewell to be presuppositions of knowledge, embedded in ideas. Yet their roles are appreciably different: axioms are in rational ethics used for *proving* claims to knowledge (whether rules are right), which in science falls to the lot of the *a posteriori* test of consilience, axioms transmitting necessity to, and assisting deductive ordering of, propositions less general.

The presence in science and ethics of the 'fundamental antithesis' provides what is for Whewell perhaps their most striking similarity. The antithesis is recognized in *Philosophy of the Inductive Sciences* in its second edition ([2.3], x) as 'suited to throw light upon Moral and Political Philosophy, no less than upon Physical'. Now without in any way gainsaying that Whewell often employs the terms 'idea' and 'fact' in *Elements of Morality*, one does find that phenomena to which he applies them are in their natures most diverse. He for example writes of ideas and conceptions of primary rights, and of their 'definitions' by positive laws as facts. In another part of the work, as already we have had cause to comment, he finds in natural religion the idea 'of the course of the World', whose corresponding fact is God's manifestations in history (revealed religion). But Whewell's principal usage, of 'idea' at any rate (for he is silent on what the term 'fact' might in this case mean),[26] is that which we find in his explication of rational moral-ity. And the way in which he understands ideas here is nothing like how he understands them in his philosophy of science. Whewellian ideas in rational ethics are *ideals* forming *subjects* of inquiry. To know their content is to have moral knowledge about what rules are right. In science, by contrast, ideas are conditions of and materials for knowledge, of which *physical reality* is the *subject.* Gaining knowledge of that reality, a scientist at the same time gains knowledge of ideas, but the latter is more properly regarded as a secondary effect of enquiry rather than as its purpose.

Whewell has been described as having 'written with an explicit view not merely to embrace the world of learning but to synthesize it and render it a unified intellectual whole' (Fisch [2.13], 31), and this may well be true. But if he so sought synthesis and unification, what has been said in this paper must cast doubts on whether he attained them.

NOTES

A significant portion of the research for this study was undertaken in 1992 during a Visiting Fellowship at The Australian National University's Research School of Social Sciences. The author gratefully acknowledges the support of Professor Geoffrey Brennan, the School's Director, and that of Professor Eugene Kamenka, chair of the Research School's History of Ideas Unit. For helpful comments on draft versions of the paper he

thanks: Mr Kerry Cardell, Professor David Walker, Dr George Zollschan, and Dr Frank Maher.

1 'Whewell himself regarded his *History of the Inductive Sciences*…and *Philosophy of the Inductive Sciences*…as both the crowning achievement of his career and the unifying "hard core" of his entire system of thought' ([2.12], 2). I shall in what follows also refer to these works simply as *History* and *Philosophy*. References unless otherwise indicated are to the reprint editions (1967).

2 Cohen ([2.7], 528ff.) is illuminating on Whewell's notion of revolution.

3 Schipper ([2.20], 49), after noting several respects in which Whewell's historiography of science anticipates that unfolded by Kuhn in *The Structure of Scientific Revolutions*, argues that in this—cognitive continuity (Whewell) as against discontinuity (Kuhn)—consists their major difference. This leads on to a further difference: science from Kuhn's standpoint is ultimately aimless while Whewell ascribes to it the aim of truth.

4 As Richard Gregory ([2.14], 219), distinguished psychologist of perception, states: 'objects have a host of characteristics *beyond their sensory features*. They have pasts and futures; they change and influence each other, and have hidden aspects which emerge under different conditions' (emphasis added). Whewell's account of perception (and of facts) has a readily discernible counterpart—'theory-dependence of observation'—in writings of such twentieth-century figures as Karl Popper, N.R.Hanson, and Kuhn.

5 As explicitly defined, *'ideas'* refers 'to certain comprehensive forms of thought,—as *space, number,*…—which we apply to the phenomena which we contemplate'. Whewell ([2.3], 2:5–6) then proceeds to define the important related term—'*conceptions'*—as 'special modifications of these ideas', giving as examples *'a circle, a square number, an accelerating force, a neutral combination* of elements'.

6 A fine-grained, more technical and more manifestly prescriptive rendering by Whewell of scientific methods is in Book XIII of the *Philosophy*. Ducasse ([2.9], 183–217) digests this particular book; Todhunter ([2.25], 139–42) detects several discrepancies between its structure and that of Book XI.

7 With reference to their disregard of this condition Whewell explains the Greeks' failure fully to cultivate science, whereas in the 'Stationary Period', as noted, the accent was the opposite, on ideas at the expense of facts.

8 This suggests that facts are reports of perceptions of concrete objects and events. 'Fact' for Whewell may also cover theories or inductions as candidates for explanation. In the latter distinction theories and facts are of the same nature, have the same properties, the distinction being time-dependent and relative.

9 Niiniluoto [2.18] deals at length, in most interesting fashion, with this and other similarities between the images of science of Whewell and Popper.

10 This explication of consilience owes a great deal to that of Fisch [2.11].

11 According to Fisch ([2.10], 287; [2.12], 158) Whewell's axioms are true only of ideas. But if, as quite clearly Whewell maintains, axioms are true 'beyond… experience' they must also be true within and of it. He is to be understood as saying that axioms (1) express the content of ideas, and (2) are propositions about physical reality.

12 Some would say (e.g. Fisch [2.10]; [2.12]) that Whewell's *Mechanical Euclid* provides ample evidence for this claim. But Whewell there on my reading presents the distinction between inductive (non-necessary) and non-inductive (necessary) truths in mechanics as absolute rather than as epistemologically relative (to the state of knowledge). So no matter what he may say or suggest to the contrary, on his account of it in that work, the non-

necessary truths cannot and can never be logical derivatives of the necessary. That which *is* true (but could be false) is not among the implications of that which *must* be true.

13 Again, aside from those passages already referred to, Whewell should be seen as operating with just such a distinction in his opening account of necessity in *Philosophy of the Inductive Sciences* ([2.1], 54–73).

14 The paucity of exceptions serving to prove this rule are Schneewind ([2.21] and [2.22], 101–17) and Donagan [2.8].

15 About this Whewell is clearest in the preface of the first edition. See also the letter in Stair Douglas ([2.23], 326), and the preface of the fourth edition ([2.4], 3 and 6).

16 For further discussion of happiness and of utilitarianism see Whewell [2.5], x, 170ff., 174ff., and 188ff.; [2.4], 125–6, 254ff.

17 Not always faithful to this characterization, Whewell ([2.4], 244) may on occasion subsume external action under precepts.

18 The language of necessity (‘must’), freely employed in the *Elements*, is ambiguous in signifying what ought to be (ideal morality), or else what cannot but exist (in ‘national’ moralities) in that human nature demands and cannot survive without it. Arguing that certain rights ‘must’ exist, Whewell conflates both senses.

19 For extensive enumeration of the operations of the faculty of reason see Whewell [2.4], 23–4.

20 Other relations between rights and morality are delineated later in the work ([2.4], 201f., 229ff., 337ff.).

21 The same contradiction between this and his doctrine about necessary rights is latent in a note in the second and subsequent editions ([2.4], 62).

22 This calls into question the categorization of Whewell as an ‘intuitionist’. Tracing rights from human nature his method is a combination of empiricism and deduction.

23 This embracing conception of happiness is noteworthy for being akin to that which one finds in John Stuart Mill’s ‘utilitarianism’.

24 Not the least of the difficulties facing the reader of *Elements* is that a number of key terms have different denotations which Whewell fails to mark. ‘Ideas’ is a case in point: usually referring to a select class of ideals or objects of action, Whewell ([2.4], 94–5) may also apply it to dispositions to seek those objects.

25 Similarity of methods is suggested, it is true, in the *Lectures* ([2.5], 168) but not shown, and careful examination of the texts uncovers no evidence of it.

26 Schneewind ([2.21], 120) speaks in this context of ‘Human Nature’ as the corresponding ‘fact’, but he provides no evidential support to show Whewell has this in mind and, so far as this author can ascertain, none exists.

CHAPTER 3
J.S.Mill

Ethics and politics

R.F.Khan

ON LIBERTY

John Stuart Mill's mature views on ethics and politics are to be found in *On Liberty* (published in 1859), *Utilitarianism* (1861), *Considerations on Representative Government* (1861) and *The Subjection of Women* (written in 1861–2 but published in 1869). Of these, *Liberty* is the centrepiece, detailing the doctrines and themes which govern most of the discussion in the other works. It is also the work by which Mill will be most remembered. He himself picked it out as 'likely to survive longer than anything else' that he had written.[1] It has aroused more controversy than any other of his writings, and the essay *On Liberty* has been taken by many of Mill's critics as well as his supporters to be the most distinctive if not authoritative statement of the liberal position.[2]

In Mill's words, the subject of the essay is 'moral, social, and intellectual liberty asserted against the despotism of society whether exercised by governments or by public opinion' (15:581). From the outset, Mill emphasizes the threat to individual liberty posed by 'the tyranny of the majority' exercised either by a democratically elected government or through the non-legal pressure of public opinion (219–20).[3] This was a concern that Mill had expressed in earlier writings, notably in the article on *Bentham*[4] and in his reviews of Alexis de Tocqueville's *Democracy in America*.[5] In *Liberty* the main threat to individual independence is portrayed as coming from majority rule. This is because Mill believed that, at least in the western world, democracy based on universal suffrage was the inevitable next stage of history (218).[6] But it makes little difference to his main arguments whether the threat to individual liberty comes from a majority dominated govern-ment and society or from non-democratic or less democratic social and political organization.

In order to draw the dividing line between the area of individual independence and social control, Mill appeals to a 'very simple principle' initially stated and elucidated as follows:

> the sole end for which mankind are warranted, individually or collectively, in interfering with the liberty of action of any of their number, is self-protection…. [T]he only purpose for which power can be rightfully exercised over any member of a civilized community, against his will, is to prevent harm to others. His own good, either physical or moral, is not a sufficient warrant. He cannot rightfully be compelled to do or forbear because it will be better for him to do

> so, because it will make him happier, because, in the opinions of others, to do so would be wise, or even right. These are good reasons for remonstrating with him, or reasoning with him, or persuading him, or entreating him, but not for compelling him, or visiting him with any evil in case he do otherwise. To justify that, the conduct from which it is desired to deter him, must be calculated to produce evil to some one else. The only part of the conduct of any one, for which he is amenable to society, is that which concerns others. In the part which merely concerns himself, his independence is, of right, absolute. Over himself, over his own body and mind, the individual is sovereign. (223–4).

Two points fundamental to Mill's doctrine are affirmed here. Firstly, the self-protection principle, invoked to justify social and other external restrictions on individual independence, appeals to the distinction between conduct that only 'concerns the individual' and that which also 'concerns others'. This distinction, commonly referred to as that between 'self-regarding' and 'other-regarding' actions,[7] has often been the target of Mill's critics. They have sought, by challenging the validity of the distinction, to undermine Mill's entire case for individual liberty. The standard objection has consisted in denying that there is, or can be, any such thing as purely self-regarding conduct. James Fitzjames Stephen, a younger contemporary of Mill and a most vehement critic, declared that 'every act that we do either does or may affect both ourselves and others', consequently the distinction between self-regarding and other-regarding actions is 'altogether fallacious and unfounded'.[8] And in spite of the fact that what Mill says in further elaboration of the distinction is enough to rebut this objection, it has been echoed by other commentators.

The second feature of Mill's doctrine that is emphasized in the passage quoted above is the rejection of paternalism—the view that society is justified in preventing otherwise fully responsible people from hurting or injuring themselves. The individual's own good or simply the perceived wrongness of his or her conduct is never 'a sufficient warrant' for any kind of coercive interference on the part of society or anyone else. Mill's uncompromising stand against paternalism has provoked much criticism and has found little favour even amongst many of those who claim to support his other views and his general outlook.[9]

Mill claims that his case for individual liberty is based on utilitarian grounds: 'I forego any advantage which could be derived from the idea of abstract right, as a thing independent of utility. I regard utility as the ultimate appeal on all ethical questions; but it must be utility in the largest sense, grounded on the permanent interests of man as a progressive being' (224). However, this qualification of the principle of utility, particularly as Mill presents it in the detail of his argument, has led some commentators to hold that Mill has abandoned utilitarianism,[10] and many others to assign to him doctrines which are more or less radically modified versions of classical or Benthamite utilitarianism.[11] Whether, and to what extent, this is true constitutes an area of continuing interest in Mill's moral and political philosophy.

The view that self-regarding conduct should be protected from external coercive interference implies, as Mill points out, the freedom to frame and pursue our plan of life so long as what we do does not harm others; and also the freedom to associate with others

for purely self-regarding purposes. Mill also specifies as a necessary feature of a free society: 'liberty of conscience, in the most comprehensive sense; liberty of thought and feeling; absolute freedom of opinion and sentiment on all subjects, practical or speculative, scientific, moral, or theological' (225). However, Mill does not justify freedom of speech on the grounds of a simple appeal to the self-protection principle. Although expressions of opinion may be said to be a species of other-regarding conduct, the question of their permissibility or otherwise is not to be decided on the basis of how they affect others—because 'The liberty of expressing and publishing opinion…being almost of as much importance as the liberty of thought itself, and resting in great part on the same reasons, is practically inseparable from it' (225–6). Mill's concern is to defend freedom of speech regarding only the subjects he specifically mentions, thus excluding matters pertaining to a person's private affairs. It is with respect to this specified area of thought that he supports absolute or unrestricted freedom of expression,[12] and seeks to justify it on grounds other than those based on the distinction between self-regarding and other-regarding conduct.

The essential ideas which constitute or underpin Mill's defence of individual freedom are the distinction between self- and other-regarding conduct, the rejection of paternalism, the unrestricted right to freedom of expression, and the ethical doctrine to which he appeals. These are the theses that his critics have challenged ever since the publication of *Liberty*. And the fact that they are still being questioned speaks not only for the central character of the issues Mill addresses but also for the strength of the arguments that can be mounted in defence of his answer.

FREEDOM OF EXPRESSION

Chapter 1 of *Liberty,* which sets out Mill's general position, is followed by his defence of freedom of expression. Almost a third of the book is devoted to this subject and it is clear that Mill regards the arguments and considerations that he advanced in support of free speech to have special significance for individual liberty.

The central argument[13] that Mill cites against censorship is epitomized in the statement that 'All silencing of discussion is an assumption of infallibility' and, therefore, unjustified since any such assumption must be unfounded (229–30).[14] The argument proceeds on the basis that 'Complete liberty of contradicting and disproving an opinion, is the very condition which justifies us in assuming its truth…; and on no other terms can a being with human faculties have any rational assurance of being right' (231).[15] This is a logical claim regarding the rationality of beliefs or the basis for the assignment of truth-values to beliefs. Mill's contention is that we are entitled to hold a belief or declare it to be true only if it is open to criticism and survives attempted refutations. Consequently, if discussion and criticism of an opinion are prevented by legal or social restrictions, then there can be no rational basis for taking it to be true or false.

This principle of the rationality of beliefs is explicitly acknowledged in the following passage:

> The beliefs which we have most warrant for, have no safeguard to rest on, but a

> standing invitation to the whole world to prove them unfounded. If the challenge is not accepted, or is accepted and the attempt fails, we are far enough from certainty still; but we have done the best that the existing state of human reason admits of; we have neglected nothing that could give the truth a chance of reaching us: if the lists are kept open, we may hope that if there be a better truth, it will be found when the human mind is capable of receiving it; and in the meantime we may rely on having attained such approach to truth, as is possible in our own day. This is the amount of certainty attainable by a fallible being, and this the sole way of attaining it. (232)[16]

The passage also indicates that in Mill's view there are no absolutely certain beliefs and that all claims to truth are provisional in so far as subsequent criticism may overthrow them.[17] Of course, as Isaiah Berlin points out, those who maintain that it is possible to ascertain and affirm absolute truths will not accept Mill's account of the logical foundation of beliefs.[18] On the other hand, those who claim that we can get hold of absolute truth, particularly in the area of human affairs, will need to show that we can still have a viable conception of rationality, and it is Mill's contention that this is not possible.[19]

Fitzjames Stephen, who recognized the real (logical) character of the argument from infallibility,[20] challenged it on the grounds of irrelevance to the question of censorship. He pointed out that censorship may be, and commonly is, justified not because the suppressed opinion or doctrine is considered to be false but because 'it is not considered desirable that it should be discussed' ([3.30], 77). Mill anticipates such a move which, as he puts it, seeks to make 'the justification of restraints on discussion not a question of the truth of doctrines, but of their usefulness; and flatters itself by that means to escape the responsibility of claiming to be an infallible judge of opinions' (233).[21] He rejects the move on the grounds that 'no belief which is contrary to truth can be really useful' in that no one can genuinely hold a belief unless it is taken to be true. And as the usefulness of a belief requires that it should be subscribed to, it follows that its utility would also require it to be regarded as true.[22] What Mill is maintaining here is not to be questioned on the grounds that many useful beliefs happen to be false. What, in his view, is necessary is that when these beliefs are held they are subjectively taken to be true. Consequently, beliefs protected from criticism on the basis of their utility must also be viewed as true, and those contrary to them as false, thus exposing such a move to the original charge of irrationality. No doubt those who protect a belief because of its utility—the censors—need not take it to be true and may even regard it as false. But they cannot avoid *declaring* it to be true in so far as they want to promote subscription to it. And as they must declare it to be true without permitting it to be criticized, they present themselves as infallible.[23]

In the second part of his case against censorship Mill proceeds as if he concedes for the sake of argument that truth is not logically tied to scrutiny and discussion.[24] We may then take an opinion to be true independently of any critical assessment of it. But, Mill declares, this still does not justify protecting it from criticism because such a move reduces the belief in question to 'a dead dogma',—'held in the manner of a prejudice… deprived of its vital effect on the character and conduct,…as a mere formal

profession' (243, 258). If beliefs are to function as living truths governing the conduct and affairs of those who hold them, they need to be fully and frequently put to the test of critical discussion. Mill suggests that where there is a natural and general consensus in favour of some view, it may be necessary to introduce artificially a programme of dissent and criticism in order to vitalize it (251).[25]

It is not clear why, and consequently in what sense, opinions in the absence of discussion turn into 'dead dogma'. On the one hand, we are told that they have no effect on character and conduct in that they involve only a verbal adherence.[26] Those who hold a belief or subscribe to a doctrine in the absence of discussion do not in any proper sense of the word know what they profess, the very meaning of the belief is lost or seriously distorted (247, 258);[27] consequently, it cannot have any significant impact on character and conduct. On the other hand, the protected beliefs are said to be held as mere prejudice, without any rational consideration of their grounds (244). But as we all know, prejudice serves very effectively as a determinant of dispositions and actions. Moreover, the examples that Mill gives of 'dead' beliefs do little to clarify the conception. He points out that 'the maxims and precepts contained in the New Testament', which constitute the central doctrines of the faith, were accepted as 'living truths' by the early Christians because they were held in the face of active and hostile criticism. These same doctrines have become 'dead dogmas' because in the modern era Christianity is protected from critical dissent. With hardly any exception, latter-day Christians merely verbally acknowledge that one should love one's neighbours as oneself or take no thought for the morrow, or that it is doubtful that the rich can enter the kingdom of heaven, etc. without acting on these beliefs (248–50). But clearly the case that Mill draws attention to is open to a different and more reasonable interpretation. The beliefs he mentions are those whose content essentially spills over into conduct, so that in the consistent absence of relevant actions we may well deny that they are held at all by those who profess them. What we would have then would be cases of hypocrisy and not, as Mill claims, failure to grasp the meaning of these propositions.

This is the least satisfactory part of Mill's case for freedom of expression. Even if we grant that protecting a belief from criticism implies ignorance of its grounds,[28] it does not follow from this that one does not know the meaning of what one believes.[29] The view that a racial group is inferior in specified respects may be protected from criticism without any loss in meaning to those who subscribe to it.[30] Propaganda and other forms of indoctrination by their very nature exclude criticism and rational discussion but they still succeed in promoting the desired beliefs. And, as history shows, there is no reason to hold that such protected beliefs have little or no direct influence on conduct.

The strength of Mill's case against censorship lies in his central contention that the very idea of rationality regarding beliefs and attitudes depends on the possibility of critical assessment. The value of freedom of expression then consists in the fact that its provision makes it possible for us to be rational. Where the life of a community is concerned, freedom of discussion is indispensable for 'great thinkers' to pursue bold and novel lines of thought, and much more so for 'average human beings to attain the mental stature they are capable of (243).[31] In other words, since our mental well-being depends on our being rational, freedom of discussion is necessary for our mental well-being (on which all other well-being depends) (257–8).

SELF-REGARDING CONDUCT AND INDIVIDUALITY

The line dividing the area of individual freedom from that of legitimate social control is identical to that separating self-regarding from other-regarding conduct. Mill indicates from the start that the boundaries of these regions are not to be drawn simply on the basis of determining whether or not a causal connection exists between the individual's actions and specified effects suffered by others. Rather, he makes it abundantly clear that we need to appeal to a normative criterion in order to demarcate between self-regarding and other-regarding conduct. Thus, in the opening chapter of *Liberty*, Mill describes the area of self-regarding action as 'comprehending all that portion of a person's life and conduct which affects only himself, or if it affects others, only with their free, voluntary and undeceived consent and participation' (225).[32] This statement is immediately qualified: 'When I say only himself, I mean directly and in the first instance; for whatever affects himself may affect others through himself; and the objection that may be grounded on this contingency will receive consideration in the sequel' (225). In the 'sequel', i.e. chapter 4 of *Liberty*, Mill concedes that

> the mischief which a person does to himself may seriously affect, both through their sympathies and their interests, those nearly connected with him, and in a minor degree, society at large. When, by conduct of this sort, a person is led to violate a distinct and assignable obligation to any other person or persons, the case is taken out of the self-regarding class, and becomes amenable to moral disapprobation in the proper sense of the term… Whoever fails in the consideration generally due to the interests and feelings of others, not being compelled by some more imperative duty, or justified by allowable self-preference, is a subject of moral disapprobation for that failure, but not for the cause of it, nor for the errors merely personal to himself, which may have remotely led to it. In like manner, when a person disables himself, by conduct purely self-regarding, from the performance of some definite duty incumbent on him to the public, he is guilty of a social offence… Whenever…there is a definite damage, or a definite risk of damage, either to an individual or to the public, the case is taken out of the province of liberty and placed in that of morality or law… But with regard to the merely contingent, or…constructive injury which a person causes to society, by conduct which neither violates any specific duty to the public, nor occasions perceptible hurt to any assignable individual except himself; the inconvenience is one which society can afford to bear, for the sake of the greater good of human freedom. (281–2)[33]

Although, in these statements, Mill seems to be specifying two necessary conditions of self-regarding conduct—that it does not involve the breach of a specific duty and also that it is not the cause of perceptible hurt to an assignable individual—further consideration shows that the second condition should be regarded as subordinate to the first. The cases of contingent injury that Mill specifies are of the following four kinds: (1)

An individual through some form of self-indulgence harms himself (‘deteriorates his bodily or mental faculties’) with the result that he is unable to use his abilities for the benefit of society, e.g. he cannot be, or any longer function as, a doctor (280).[34] (2) Similar conduct on the part of an individual that affects others adversely by serving as a bad example which they follow (280). (3) An act (e.g. not observing the Sabbath) which causes pain and distress to others because it goes against their views and practice (283ff.).[35] (4) An individual’s success in a competitive examination, or the competitive selection of candidates for a job, causes loss and pain to those who, as a consequence, are not preferred (292–3). The injury caused in these and other cases may be perceptible enough and may clearly affect assignable individuals. For example, selling or renting a house to a black family in a white neighbourhood may bring about a fall in the value of adjacent properties, so that other house-owners suffer serious financial loss. Or the knowledge that the next-door neighbours are atheists may cause a religious person’s feelings to be outraged to the extent of bringing on a serious illness. What would make these injuries ‘merely contingent’ is not the fact that they are ‘non-perceptible’ nor the fact that they do not affect an assignable individual—for in these two cases we can specify precisely those who suffer a clear injury—but the fact that the individual concerned is not violating any specific public duty or any distinct obligation to the other persons concerned. No one, it might be said, is under an obligation not to sell or rent a house to a black family, or to be religious.

It is along these lines that Mill responds to the kind of cases he mentions. With regard to (1) above, he points out that society has no right to exact any socially beneficial exercise of the talents and capacities which individual members of it may possess, so that the individual has no such corresponding duty (282).[36] In connection with (4), he states that ‘society admits no right, either legal or moral, in the disappointed competitors to immunity from this kind of suffering’, i.e. no one owes a duty to another to ensure that such pain and loss does not occur (293). With regard to (3), the actions complained of cause pain and distress to others only because they are believed to be wrong, so that the injury in question would not exist independently of these beliefs.[37] Mill takes this fact to imply that the so-called injured parties in such cases have no right to expect those, whose conduct is found to be offensive to act differently.[38] Mill’s notion of self-regarding conduct then depends on the existence and nature of the duties the individual owes either to society at large or to other persons. If an action is not a violation of such a duty then it is to be classified as self-regarding and any injury it causes to others taken to be merely contingent.

How should we determine the existence and nature of these duties which serve to mark out self-regarding from other-regarding conduct? It is as a utilitarian that Mill claims to answer this question. The ultimate appeal on all ethical questions should be to utility, provided that we take it to be ‘grounded on the permanent interests of man as a progressive being’ (224). This qualification is explained in chapter 3 of *Liberty* where Mill specifies *individuality* to be ‘one of the principal ingredients of human happiness’, ‘one of the leading essentials of well-being’ (261). What he has centrally in mind when he speaks of ‘individuality’, in particular ‘the free development of individuality’ or ‘individual spontaneity’, is the development of a certain kind of character or person. The favoured kind of person is one who does not do things just because it is customary or

because it conforms to someone's views. This does not mean that such a person ignores general preferences and other people's views but only that this 'recorded experience' when available is used and interpreted in the individual's 'own way', in so far as it is deemed to be 'properly applicable to [the individual's] own circumstances and character' (262). What Mill values here is the nature or character of the individual's choice, of the reasons for which a course or policy of action or plan of life is chosen. The desirable kind of choice is that where the grounds on which it is made and justified are the product of the individual's own reasoning and judgement taking into account his or her own beliefs and desires, and not something derived mechanically from an external source ignoring 'the opinions and feelings of home growth' (264–5). Mill insists that such a choice should be based on the individual's 'own impulses and desires', which he identifies in terms of the distinction drawn between a deliberately made person whose character has been fashioned on the lines of a model hostile to natural endowment and one whose development has been allowed to occur 'naturally' within the unavoidable framework of a particular social and cultural environment.[39] It is only the latter kind of person whose desires can be said to be their own, it is only of such individuals that we can predicate true 'individuality of desires and impulses' and, accordingly, what we might call autonomous or genuine choice (264).[40]

Mill declares that it is only by making autonomous choices that one exercises and develops the essential human faculties of 'perception, judgement, discriminative feeling, mental activity, and even moral preference' (262), whereas those who fail to operate autonomously fail to make a choice in the proper sense of the word.[41] If choosing non-autonomously is not to choose at all, then we can say that what Mill wants to secure is freedom in a substantial or positive sense of the term—not simply freedom from external interference which allows the translation of prevailing desires into action but which also consists in being moved by reasons which are, in the sense specified, one's own and in realizing one's own purposes and goals.[42]

If it is only the individually spontaneous person who is a human being in the full sense of the term—in that we have with such a person the development of distinctive human endowments—then we can see what Mill means when he declares individuality to be one of the principal ingredients of human happiness and, therefore, desirable in itself. In so far as we aim to bring about happiness, we must find place in this final end for the happiness of those who have developed their individuality. And if we measure happiness in terms of pleasure or the satisfaction of desires and preferences, then we can point out on Mill's behalf that individually spontaneous persons will gain pleasure or satisfaction from the fact that they act and live in accordance with their true nature, i.e. in being what they are. In addition, Mill holds out other avenues of satisfaction available to autonomous persons if they develop their capacities to the full—the satisfaction of having achieved a distinct wholeness of being which translates into the pattern of their lives.[43]

The values placed on the development of individuality can be carried over to the pleasure or satisfaction associated with it. However, this does not mean that we can detach the pleasure or satisfaction from the exercise of individuality—it has value as part of happiness only because it is related to individual spontaneity. Mill's qualified appeal to the principle of utility on the basis of taking into account 'the permanent interests of man as a progressive being' amounts to assigning an independent intrinsic value to the

development of individuality ([3.31], 73–5). Again, the modified view is not an aggregative doctrine ([3.31], 78–9). Neither the development of individuality nor the attendant satisfaction can be traded off against a greater degree of it in some other case or against a nett increase in the total amount.

If individuality is recognized to be desirable in itself then each of us will have a right to its promotion provided that what we do does not prevent others from pursuing it.[44] Consequently, there will exist a general duty to refrain from acting in ways that prevent others from being individually spontaneous and, in this sense, to refrain from harming or hurting them. The boundaries of self-regarding conduct in specific situations will be marked out on the basis of respecting the rights of others, and acknowledging corresponding duties, regarding the development of individuality.

We also need to consider the other components of happiness in order to determine rights and duties, and by reference to these the boundaries of individual freedom. In *Utilitarianism* Mill takes observance of the 'rules of justice', i.e. the moral rules which fall under the category of justice, to be part of 'the essentials of human well-being' and thus as the grounds, in given situations, of specific duties to others.[45] Examples of such duties, whose violation constitutes harm done to others, and determines the conduct to be other-regarding, are the obligation to keep one's promises or carry out the requirements of a commitment that one has voluntarily entered into (10:242–3). It is on this basis that in *Liberty* Mill declares that a man may be legally coerced into providing education for his children, and that it would not be a violation of liberty to legally forbid marriage unless the parties concerned can show that they have the means of supporting a family (300–4). In addition, there are duties which we owe to the society to which we belong and whose object is to ensure its continued viability—for example, to give evidence in a court of law, to share in the common defence of the country, etc. (224–5). Our obligations to the community and to others will need to be restricted to the minimum required for a viable society to exist in order to provide for a sufficiently large area of self-regarding conduct and of individual freedom. But this will be secured by the great intrinsic value placed on individual spontaneity.

As a component element of happiness or well-being, individuality is regarded as a greater good than the other elements. Its higher value is justified on the grounds that it is a necessary condition of other components of happiness: 'it is not only a co-ordinate element with all that is designated by the terms civilization, instruction, education, culture, but is itself a necessary part and condition of all those things'.[46] Without individual spontaneity these other ends will lose their value—for what can be the worth of education and culture if those involved in their pursuit are incapable of thinking and deciding for themselves? The classical utilitarian ends of pleasure and freedom from pain will also form part of happiness, and they may be partly accommodated under 'the obligations of justice' which provide security for the individual in various respects (10:251). Otherwise they are to be regarded as goods which are less valuable than the other components of happiness: paternalistic control may promote people's welfare or keep them out of harm's way, but the comparative worth of such an undertaking will be much less than individuals determining their own affairs (263).

Mill concedes that some, possibly many, may not want to lead an individually spontaneous life because they do not recognize its intrinsic value (261, 267). To these one

can point out that a society which permits and encourages the free development of individuality will benefit in that such a move will introduce ‘originality’ in its affairs. The value of originality is said to consist in the discovery by ‘persons of genius’ of ‘new truths’ and ‘new practices’ which may prove beneficial to others in the community. In addition, we may expect the free development of individuality to promote the existence of ‘a succession of persons whose ever-recurring originality’, by insisting on an independent and rational scrutiny of the grounds of generally accepted beliefs and practices, will help to prevent merely mechanical and unthinking acceptance of these on the part of the rest of society (267). Clearly, in the latter sense of ‘original’, the belief or practice that is supported need not be novel, and all that is required is that its truth or desirability is affirmed or defended independently by the individual.[47] Mill admits that geniuses are likely to be few in number, so that it is originality in the sense of independence of thought that may be held out as being within the reach of the generality of humankind and as a necessary feature of a free society. Far from advocating the control of a community by an elite or ‘the strong man of genius’, it is originality in the sense of independence of thought that Mill emphasizes: ‘If a person possesses any tolerable amount of common sense and experience, his own mode of laying out his existence is the best, not because it is the best in itself, but because it is his own mode’ (270).[48]

PATERNALISM

The intrinsic value placed on individuality rules out, with exceptions, paternalism, i.e. the entitlement to coerce people for their own good, for example, prevent them from hurting themselves. One class of exceptions Mill stipulates is children and persons below the legal age of adulthood as well as ‘those backward states of society in which the race itself may be considered as in its nonage’ (224). In the case of the latter, benevolent despotism, which seeks to improve the condition of the people, is justified until they have become ‘capable of being improved by free and equal discussion…, of being guided to their own improvement by conviction or persuasion’ (224). It is very likely that Mill had in mind not only ancient communities but also contemporary societies judged not to be developed enough for the application of libertarian principles. His view may be challenged on the grounds that he is mistaken about the existence of such societies anywhere whose members are generally incapable of being moved by rational discussion and persuasion. But by convicting Mill of any such factual error we do not invalidate his case against paternalism.[49]

The other kind of exception mentioned by Mill is that where we are justified in forcibly preventing people from injuring themselves because it is clear that they are not aware of what they are doing—e.g. physically preventing someone from crossing an unsafe bridge when they are ignorant of its condition and there is no way of warning them (294). Ignorance of the particular circumstances of the action in such a case vitiates the decision to perform it.[50] But where there is no reason to doubt the voluntary character of the individual’s choice then there is no basis for any kind of paternalistic interference, however undesirable or harmful the consequences of the action may be for the agent

concerned.[51]

To abandon coercion in such cases is not to give up attempts to influence the individual to modify his conduct. We may, and in certain circumstances should, try to deflect someone from harming himself or herself by means of advice, persuasion or entreaty. And where self-regarding conduct exhibits folly or some other defect it may, according to Mill, properly become the object of distaste and even of contempt on the part of others. Such adverse judgements of individuals' self-regarding deficiencies may carry further penalties in the form of avoidance of their society or cautioning others about them, etc. Such penalties are not to be seen as specially designed forms of punishment—they are the natural outcome of the individual's self-regarding faults in that the restrictions they bring are 'strictly inseparable from the unfavourable judgement of others'. If we feel contempt regarding a person's conduct then it is natural (to be logically expected) that, unless there is some special reason for explanation, we will avoid the individual's company. Mill emphasizes the difference between adverse judgements of self-regarding faults and moral denunciations of harmful other-regarding actions. In the latter case, the conduct is regarded as the proper object of 'moral reprobation, and, in grave cases, of moral retribution and punishment'. Moreover, the penalties suffered in such cases are purposely inflicted in order to punish the individual. Self-regarding faults 'are not properly immoralities, and…do not constitute wickedness'. What they reveal is folly, imprudence and absence of self-respect and, as such, deserve 'lack of consideration' but not 'reprobation'; consequently, they do not call for any kind of coercive interference in the individual's affairs (278–80).[52]

Referring to Mill's views on paternalism, H.L.A.Hart states that he

> carried his protests…to lengths that may now appear to us as fantastic. He cites the example of restrictions of the sale of drugs, and criticizes them as interferences with the liberty of the would-be purchaser rather than with that of the seller. No doubt if we no longer sympathise with this criticism this is due, in part, to a general decline in the belief that individuals know their own interests best, and to an increased awareness of a great range of factors which diminish the significance to be attached to an apparently free choice or to consent. Choices may be made or consent given without adequate reflection or appreciation of the consequences; or in pursuit of merely transitory desires; or in various predicaments when the judgement is likely to be clouded; or under inner psychological compulsion; or under pressure by others of a kind too subtle to be susceptible in a law court. Underlying Mill's extreme fear of paternalism there perhaps is a conception of what a normal human being is like which now seems not to correspond to the facts. Mill, in fact, endows him with too much of the psychology of a middle-aged man whose desires are relatively fixed, not liable to be artificially stimulated by external influences; who knows what he wants and what gives him satisfaction or happiness; and who pursues these things when he can.[53]

Part of this criticism, in so far as it depends on the defective character of the individual's choice, will fall under the exceptions Mill cites to his rejection of paternalistic

interference. And where the impairment of the individual's choice is due to the activities of others (for example the use of various kinds of subtle pressure), the coercive interference, even if not provable in a court of law, will still invoke the self-protection principle. If the impairment of individual choice is said to be substantial, then, besides enlarging the area of paternalistic direction, we will need to bring about other more radical institutional changes, e.g. exclude at least the ordinary person from serving on juries or electing a legislature etc. If we are not prepared to support such moves then, to that extent, we cannot support Hart's general doubts regarding the authenticity of individual choice.

The other common objection to Mill's rejection of paternalism, which Hart also mentions, is that it is doubtful that individuals know their own interests best. However, it is not Mill's contention that individuals can always or mostly be relied on to know where their real good lies but only that others are unlikely to do so. This is because estimates of the individual's interests made by others are arrived at from the outside, so to speak, and they fail to capture the intimate view which the person actually affected by the situation normally has. In contrast, the individual's own assessments of what constitutes his or her good are more reliable because 'with respect to his own feelings and circumstances, the most ordinary man or woman has means of knowledge immeasurably surpassing those that can be possessed by any one else' (277). Whereas the individual's knowledge is based on immediate acquaintance with what happens to and around, those who seek to direct his or her life from the outside can proceed only on the basis of 'general presumptions…which may be altogether wrong, and even if right, are as likely as not to be misapplied to individual cases' (277).[54]

William James, discussing the special case of appreciating the way of life of those who are significantly different from us, distinguishes (as Mill does) between how things appear from the external standpoint and the assessments made from the point of view of the individual concerned: 'The spectator's judgement is sure to miss the root of the matter, and to possess no truth. The subject judged knows a part of the world of reality which the judging spectator fails to see, knows more while the spectator knows less'. In James's view, the greater the difference in lifestyles between 'the judging spectator' and 'the subject judged', the greater the chances of the former's judgement being distorted ([3.16], 1–2). Mill (and also James) sometimes talks as if it was impossible for anyone to see and estimate things accurately enough on behalf of another person. But it is not necessary, even if it is possible, to hold this extreme view. We may concede that there may be occasions where one may understand and follow the 'mechanisms of the mind' of some people well enough. But we may still be justified in doubting that this happens, or is likely to happen, often or normally or typically. That should provide sufficient grounds to challenge the reasonableness of a policy which seeks, in the likely absence of relevant knowledge, to manage the lives of people in order to promote their real good.

Mill's objections to paternalism gain support from the additional fact that the inability to see and assess matters from the standpoint of the individual whose interests are to be promoted may lead, possibly unwittingly, to the imposition of values held by those engaged in carrying out the undertaking. Paternalism then will collapse into an attempt to bring about conformity with values held by others and the good sought on behalf of the individual misidentified in terms of a set of alien norms.[55] But, apart from all these

considerations, we cannot expect external control and direction normally to promote the individual's interests because it is a central part of the individual's good that he or she should be free from any such direction. As Mill points out, 'All errors which he is likely to commit against advice and warning are far outweighed by the evil of allowing others to constrain him to what they deem is his good' (277). If the removal of tutelage and the exercise of individuality is the most essential part of a person's well-being then how can paternalism, which consists in imposing tutelage, contribute to it?

UTILITARIANISM

In one of his earlier letters to Carlyle, Mill states that he is 'still, and likely to remain a utilitarian—but having scarcely any secondary premisses in common with those picked out as Utilitarians; and a utilitarian in a sense which no one else would regard as one' (12:207–8). Originally intended to deflect Carlyle's hostility to utility as the foundation of morals, the statement indicates well enough the final direction of his thought. There is a sense in which Mill never gave up utilitarianism but his views, in spite of his efforts to hold on to their original character, would not have been acknowledged by those professing the Benthamite and hedonistic version of the doctrine. In *Liberty*, the modified account of utilitarianism that Mill appeals to consists in specifying individual spontaneity to be both desirable in itself and a greater good than the other elements of happiness. *Utilitarianism*, which is meant to be both a defence of utilitarian doctrine and also an account of his own ethical theory, re-affirms this conception of happiness as comprising a plurality of ends some of which are more valuable than others. The 'utilitarian formula' is said to be 'a comprehensive formula, including all things which are in themselves good' (10:208) and happiness is characterized as 'a concrete whole' whose constituents or 'parts' are such things as health, virtue etc. (10:236). And although Mill declares that 'the theory of life' on which his moral views are founded is still the orthodox belief that 'pleasure and freedom from pain are the only things desirable as ends' (10:210), his further characterization of the ideas of pleasure and pain as well as the role he assigns to this central belief in our moral thinking leaves little room for the original hedonistic character of the doctrine.

Two kinds of pleasure are distinguished—that associated with the exercise of our higher faculties and the one involved in the operation of our bodily nature and the satisfaction of the animal appetites. The 'pleasures of the intellect, of the feelings and imagination, and of the moral sentiments'—of the capacities specified in *Liberty* as the distinctive endowments of a human being—are declared to have 'a much higher value, as pleasures than…those of mere sensation' (10:211). Since the difference between the two is qualitative, the higher kind of pleasure is said to be more desirable than any amount of the lesser variety (10:211). Mill leaves the difference in quality between the two kinds of pleasure to be indicated by the expressed preference (in judgement and action) of those who have had actual experience of both. No further description is given, or even considered to be possible, of the qualities which are supposed to distinguish the two kinds (10:213). This is understandable in that whether we take 'pleasure' to stand for a psychological state or experience, or construe it in terms of enjoyment or of the

satisfaction of desires, no reasonable candidate for any such distinguishing quality is available. Quantitative differences may be readily specified: the pleasure or enjoyment or gratification that attends the operation of the higher faculties may be deeper or longer lasting or superior in terms of fecundity and, on this basis, one may prefer to engage in intellectual pursuits as against the satisfaction of bodily appetites. But what other, non-quantitative, considerations can one mention here except the character of the goals pursued and activities engaged in? And it is on this basis that Mill himself promotes the distinction: the one kind of pleasure is superior to the other because the activities and pursuits it is associated with are more valuable. He speaks of opting for the higher kind of pleasure as equivalent to preferring 'the manner of existence which employs [the] higher faculties' (10:211). And he remarks on our general unwillingness 'to sink into…a lower grade of existence' because it offends 'the sense of dignity which all human beings possess in…proportion to their higher faculties… It is better to be a human being dissatisfied than a pig satisfied; better to be Socrates dissatisfied than a fool satisfied' (10:212).

If a human life, in spite of its many dissatisfactions,[56] is to be preferred to the contented life of a pig, then what makes it more valuable is its character, the kind of life it is. Mill, however, also wants to maintain that such a life, in spite of the imperfections and disappointments it is likely to contain, will still be productive of pleasure in that human beings will want to pursue it and desiring something is necessarily to find it to be pleasant.[57] In order, then, to hold on to hedonism, he falls back on a version of the doctrine according to which the pursuit of pleasure as an end turns out to be the pursuit of anything that we may desire as such. Moreover, Mill allows that we may intentionally aim at ends other than pleasure and even persist in such conduct when it is productive of pain—but in such cases it is still true that the conduct in question was originally ('in the beginning') followed because it was a source of pleasure or served to avert pain.[58] Finally, what is valued as a means to happiness (because it is externally productive of pleasure or instrumental in the satisfaction of desires) may, we are told, become *part* of it and valued for itself (for the pleasure directly associated with it).[59] It is in this way that wealth, power, fame and virtue can become parts or constituent elements of happiness. The unrestricted pursuit of some of these ends, such as power or wealth, may have a negative effect on the general welfare, but there need be no limit placed, in this regard, on the disinterested pursuit of virtue: 'Utilitarianism…could only obtain its end by the general cultivation of nobleness of character' (10:213–14), hence 'the utilitarian standard…enjoys and requires the cultivation of the love of virtue up to the greatest strength possible, as being above all things important to the general happiness' (10:237).

Mill remains a utilitarian to the extent that his moral theory appeals to *consequences* as the test of right and wrong. In this he sees himself to be following Bentham and the other classical utilitarians in holding that a necessary condition of an acceptable morality is that it appeals to an 'external standard' and is not based simply on 'internal convictions' or feelings (10:111, 179). But the consequences that Mill specifies are not restricted to pleasure and the avoidance of pain in the ordinary sense of these terms. He includes other items in his conception of happiness as the ultimate end. And he tries to preserve the hedonistic character of these items, such as the cultivation of virtue, by (1) postulating a necessary connection between desiring something and getting pleasure from it; and (2)

appealing to the empirical hypothesis that it is only by way of an original means-end relationship to pleasure that any other element of happiness comes to be valued in itself. But the first move is dubious unless we dilute 'pleasure' to mean no more than being pleased to do what one intentionally does or wants to do. And the second is equally doubtful as an account of why we come to value such things as virtue. We may get pleasure from being virtuous and perhaps, as Aristotle states, if we are truly virtuous then we must 'delight' in being so (*Nicomachean Ethics* 1104b 4–8), but this does not mean that we initially or otherwise come to value virtue for the pleasure it brings. Mill takes the main difference between his version of utilitarianism and the original Benthamite doctrine to lie in the 'secondary premisses' which his own view supports and highlights. He tries to play down the difference by claiming a hedonistic foundation for these secondary rules along the lines mentioned above. Consequently, if we reject this attempt to re-introduce hedonism then some of the secondary premisses will effectively govern interests or pick out ends other than pleasure and the avoidance of pain, such as the free development of individuality, the exercise and fulfilment of the higher human capacities, the cultivation of virtuous dispositions, etc.

The different items in Mill's conception of happiness will need to be ranked and he seems to provide for this partly by way of the distinction between higher and lower kinds of pleasure, so that those elements associated with the higher kind of pleasure may be said to be more valuable. And partly the ranking is made to depend on the extent to which an element of happiness, though valuable in itself, is also valued as a necessary ingredient of other component ends—for example the free development of individuality is valuable not only in itself but also as a necessary feature of significant achievement in education and the promotion of culture (261).[60] On this basis, 'the standard of morality' will ensure the 'happiness' (i.e. serve and advance the interests) of human beings as creatures essentially endowed with the higher faculties and capable of freely developing their individuality. This in effect is the criterion characterized by Mill in *Liberty* as the appeal to 'utility grounded on the permanent interests of man as a progressive being'.

In *Utilitarianism* Mill gives a proof of the principle of utility which has achieved notoriety because of the fallacies it is supposed to involve. The first part of the proof where these fallacies are located runs:

> [T]he only proof capable of being given that an object is visible, is that people actually see it. The only proof that a sound is audible, is that people hear it… In like manner…the sole evidence it is possible to produce that anything is desirable, is that people do actually desire it. If the end which the utilitarian doctrine proposes to itself were not, in theory and practice, acknowledged to be an end, nothing could ever convince any person that it was so. No reason can be given why the general happiness is desirable, except that each person…desires his own happiness. This, however, being a fact, we have not only all the proof which the case admits of, but all which it is possible to require, that, happiness is a good: that each person's happiness is a good to that person, and the general happiness, therefore, a good to the aggregate of all persons. Happiness has made

> out its title as *one* of the ends of conduct and consequently one of the criteria of morality.
>
> (10:234)

The inference from something being seen to its being visible is justified because it is part of the meaning of 'visible' that the thing in question is capable of being seen. But no such conceptual rule links 'desired' with 'desirable', hence what is actually desired may not be desirable (or worthy of being desired) at all. If it is Mill's purpose to base his case for utilitarianism on a strict analogy between 'visible' and 'desirable', then clearly he is guilty of arguing fallaciously. But it is open to us to take the offending statements in the proof to be no more than a bad rhetorical flourish. In the introductory chapter of *Utilitarianism*, Mill declares that ultimate moral principles cannot be justified by means of strictly deductive reasoning: 'Questions of ultimate ends are not amenable to direct proof, consequently the utilitarian theory cannot be the 'subject of what is commonly understood by proof (10:207–8). But such issues still fall within the scope of rational inquiry in that 'Considerations may be presented capable of determining the intellect either to give or withhold its assent…and this is equivalent to proof—so that we are to consider whether and 'what rational grounds…can be given for accepting or rejecting the utilitarian formula' (10:208). We can then ignore the unjustified analogy and take Mill's point to be that a central reason for regarding happiness as desirable is the fact that it is generally desired.[61] We must take happiness in this connection as comprising the constituent elements Mill assigns to it and its more or less general pursuit to be the product of experience and reflection.[62]

The further inference from each person's happiness being a good to that person to the general happiness being a good to the aggregate of all persons should also be interpreted in the light of Mill's reservations here about strict deductive proofs. What we must consider is whether there are good reasons in favour of the principle of utility, and although Mill does not canvass these reasons in the context of his proof we can specify them as they are mentioned elsewhere in his account. The consideration that seems to be most central is discussed in the chapter preceding the statement of the proof: Mill maintains that we naturally see ourselves as social beings,[63] so that whatever is thought to be necessary for the continued existence of the society to which we belong comes to be regarded as essential to human (including our own individual) existence. The movement of history is towards a state of human society where more and more people regard themselves as equal. And since social relations between equals can survive only if the interests of all concerned are considered equally, individuals in these circumstances come to recognize the interests of others as their own: 'The [individual] comes, as though instinctively, to be conscious of himself as a being who *of course* pays regard to others. The good of others becomes to him a thing naturally and necessarily to be attended to, like any of the physical conditions of our existence' (10:232). In this way the good of others forms part of the individual's own good and the greatest good or happiness of others part of the individual's greatest happiness.[64] An additional consideration that Mill seems to rely on is that ethical doctrines opposed to utilitarianism not only acknowledge the duty to pursue the general good but also assign to it a pronounced importance (10:230).[65] These opposing moralities differ from utilitarianism in that they also support

the pursuit of other ends besides happiness and the second part of the proof is designed to show that they are mistaken in this regard as happiness (in the form of promotion of pleasure and avoidance of pain) is the only end desired.

But, as we have seen, Mill reaches this conclusion on the basis of doubtful moves, so that we are left with an unreduced plurality of ends—both with regard to the opposing moralities and with regard to his own doctrine. We may, of course, group these different ends under 'happiness' as an inclusive ultimate end. One of the elements of this inclusive end will be the general well-being or the good of the society or collective to which the individual belongs. And although the general good is conceived to be the sum of the good of individuals,[66] it will function as just one of a plurality of ends and not as the overriding goal of orthodox utilitarianism.[67]

REPRESENTATIVE GOVERNMENT AND THE SUBJECTION OF WOMEN

Much of the discussion in *Representative Government* is about practical proposals regarding the mode of operation of a parliamentary government, particularly the method of electing members of parliament.[68] The theoretical issues considered relate to the value of parliamentary democracy and take up Mill's concerns regarding the dangers inherent in government by the majority.[69] Mill gives two main reasons why parliamentary democracy based on universal suffrage is to be preferred to other forms of government. Firstly, it enables every member of society to assert and defend their own rights and interests and, consequently, prevent them from being disregarded.[70] And, secondly, a democratic society, by giving citizens a voice in its affairs and letting them take part in the business of government, promotes those qualities of mind and character which make for excellence in intellectual, practical and moral capacity (19:407). The outcome of this process of education is the development in such a society of active and energetic individuals with a real desire to pursue the public good and the capacity to do so (19:408–12). The idea of individual development canvassed here is the same as that supported in *Liberty* and *Utilitarianism;*[71] hence we may take Mill's defence of representative democracy to appeal to the same conception of utility as that proposed in these works.

As regards the danger inherent in a parliamentary democracy based on universal (or fairly extensive) suffrage, Mill holds the greatest to be that of 'class legislation: of government intended for…the immediate benefit of the dominant class' made up of the numerical majority (19:446). This is the threat posed by 'the tyranny of the majority' which Bentham and the other utilitarians had ignored and which de Tocqueville had emphasized. The other defect of representative government based on majority support is the likelihood of 'general ignorance and incapacity,…insufficient mental qualifications' in those who make up the legislative body (19:436). Mill thinks that both these deficiencies can be overcome by the adoption of an electoral system such as the one proposed by Thomas Hare involving the representation of minorities in proportion to their size. This would allow minority points of view to be represented in the deliberations of parliament and thus prevent minority interests from being disregarded (19:449). The scheme would also allow people of merit and independent views to be elected, thus raising the intellectual level of the assembly and serving to counter the tendency of all

universal democracies towards 'collective mediocrity' (19:456–7). Mill is so concerned about the ignorance and stupidity of the electors rubbing off on those they elect, and thus lowering the intellectual standard of parliament, that he proposes minimum educational qualification for all voters.[72] And he also recommends, if it is possible to overcome practical difficulties, additional votes given to those who are intellectually qualified or more intelligent (19:476–9).

The presence in parliament of people representing points of view different from that of the majority, and of people who are intellectually superior, will provide a public centre of opposition and dissent where, whenever necessary, majority opinion may be challenged and minority views defended. Parliament so constituted will then perform an important social function ('the function of Antagonism') without which the community living under the unchallenged influence of the majority is likely to stagnate or decline (19:458–9). It is not too implausible to trace a connection with *Liberty* here: just as beliefs in the absence of criticism are supposed to turn into dead dogmas, so too are societies existing under the direction of unchallenged power fated to end in stagnation and decay. Conflict and collision are the foundation both of truth and social progress.

T*he Subjection of Women* is designed to show that the social and legal disabilities suffered by women (for instance in nineteenth-century England) are unjustified and that the relations between the two sexes should be governed by a 'principle of perfect equality, admitting no power or privilege on the one side, nor disability on the other' (21:261). Pointing out that he has held this view from his earliest days, Mill concedes the difficulty involved in the enterprise—not because of 'the insufficiency or obscurity of the ground of reason on which [the] conviction rests' but because the contrary beliefs are embedded in 'a mass of feeling' against which rational argument is ineffectual (21:261).[73] Consequently, much of what he has to say against the subordination of women takes on the character of tracing these 'feelings' to their source or revealing their influence when they are dressed up as 'reason'. Mill does recognize that the disabilities suffered by women, particularly their disenfranchisement and exclusion from the political process, their status in the marriage contract and relation ('the assimilation of the wife to the slave' (21:286)) and the denial of entry to the professions and educational institutions, are unjustified in terms of the principles asserted in *Liberty* and *Representative Government*. Thus, he invokes the doctrine of *Liberty* when he declares that refusing women entry into the professions and various occupations for their own good constitutes denying them 'the equal moral right of all human beings to choose their occupation (short of injury to others) according to their own preferences, at their own risk' (21:300). And he argues that given the value of 'personal independence as an element of happiness', the subordination of women, in so far as it denies them freedom as individuals, contributes to their (and to the general) unhappiness (21:336–40).[74] Again, he justifies giving women the right to vote because it is 'a means of self-protection due to every one' (21:301), appealing to what for him is an essential feature of representative democracy.[75]

However, the greater part of the discussion consists of an examination of various arguments purporting to defend the subordinate status of women. Many of these arguments are manifestly weak[76] but Mill still takes them seriously and considers them at length, possibly because he wants to reveal the underlying irrational basis in 'feeling'

and, perhaps, also because 'such things do affect people's minds' (21:303).[77] Referring to the general practice of distinguishing the sexes in terms of their different *'natural'* capacities and inclinations—so that women's disabilities (and male privileges) are seen to be natural and attempts to remove them unnatural—Mill points out that what is taken to be natural in this case can easily be shown to be the product of historical and social circumstances: 'What is now called the nature of woman is an eminently artificial thing—the result of forced repression in some directions, unnatural stimulation in others', the product of 'a hot-house and stove cultivation…for the benefit and pleasure of their masters' (21:276).[78]

Mill's account is particularly significant in that he tries to show how women become the product of the system which oppresses them, so that they may appear to justify the discrimination and may even need to be convinced of their oppression.[79] His psychological insights in this regard and in his characterization of the effects of the legal and social subordination of women on the male psyche have been singled out for praise.[80] And in general his views, and sometimes even the language in which he presents them, are well ahead of his times and more appropriate to our contemporary scene.[81] But it is the classic doctrine of *Liberty* that gives shape to most of the views expressed in the other works, so that we can see them as part of a conception of human affairs centred on the supreme value of individual freedom and autonomy.

NOTES

All references to Mill's writings unless otherwise indicated are to *The Collected Works of John Stuart Mill* cited by volume and page. References to *On Liberty* in volume 18 are by page number only.

1 '(with the possible exception of the *Logic*)' (1:259) But the parenthetical qualification has not been borne out by time. *Liberty* has continued to be the subject of discussion and controversy as much (if not more) in our times as in the years immediately following its publication. In the last two or three decades alone there have been, in English, nearly thirty studies of it and of Mill's views on ethics and politics. There is nothing comparable to this with regard to the *Logic*.

2 In the *Autobiography* Mill states that *Liberty* was revised many times (jointly by his wife Harriet and himself)—'there was not a sentence of it that was not several times gone through by us together, turned over in many ways, and carefully weeded of any faults, either in thought and expression, that we detected in it' (1:258–9). This fact seems to have escaped the notice of many of his critics, particularly those who claim to have found the most obvious inconsistencies and defects in his argument. A close reading of the text much more often than not reveals Mill's awareness of these objections and a sufficient response to them.

3 Mill often talks as if the greater threat to individual liberty exists in the coercion exercised through the medium of public opinion than in the form of legal or government interference. However, this is not meant to be taken as anything more than a contingent fact regarding English political life: 'The majority have not yet learnt to feel that power of the government their power, or its opinions their opinions. When they do so, individual liberty will probably be as much exposed to invasion from the government, as it already is from public opinion' (223).

4 According to Mill, a major defect of Bentham's political philosophy is that 'not content with enthroning the majority as sovereign, by means of universal suffrage without king or house of lords, he exhausted all the resources of ingenuity in devising means for riveting the yoke of public opinion closer and closer round the necks of all public functionaries, and excluding every possibility of the exercise of the slightest or most temporary influence either by a minority, or by the functionary's own notions of right.' Conceding that it is best (because less unjust than any other arrangement) that power should be vested in the majority, Mill proposed as a corrective institutional provisions (left unspecified) for the protection of 'freedom of thought and individuality of character, a perpetual and standing opposition to the will of the majority' (10:106–8).

5 'De Tocqueville on Democracy in America' I (1835) and II (1840) (*CW*, vol. 18). In the *Autobiography* Mill acknowledges his debt to de Tocqueville's 'masterly analysis [of] the specific dangers which beset *Democracy* considered as the government of the numerical majority'.

6 Mill accepts de Tocqueville's contention that the civilized world shows clear signs of an inevitable progress to democracy.

7 Mill speaks only of 'self-regarding' conduct etc. (226 and 276ff.); the expression 'other-regarding' has been supplied by commentators.

8 Stephen [3.30], 28. Fitzjames Stephen originally saw himself as Mill's disciple. And it was as a classical or Benthamite utilitarian, determined to rescue Mill from his heretical abandonment of the doctrine, that he attacked the views expressed in *Liberty* ([3.30], 2, 11–12). Mill's comment that he 'does not know what he is arguing against' is, in general, not an unjust assessment of Stephen's passionate but often misguided critique ([3.2], in).

9 An example of a friendly or liberal critic of Mill on this point is H.L.A.Hart who holds that 'Mill carried his protests against paternalism to lengths that may now appear to us as fantastic', hence 'a modification in Mill's principle is required' ([3.11], 32–3). At the other extreme, we have Fitzjames Stephen in whose view the ignorant and stupid, who will always exist in number in any society, clearly ought to be coerced into pursuing their own good ([3.30], 65ff.). Carlyle held similar beliefs: 'The immense mass of men he believed to be poor creatures, poor in heart and poor in intellect, incapable of making any progress at all if left to their own devices… Every advance which humanity had made was due to special individuals supremely gifted in mind and character. It was not true…that men were equal. They were infinitely unequal…in intelligence, and still more…in moral purpose. So far from being able to guide or govern themselves, their one chance of improvement lay in their submitting to their natural superiors, either by their free-will or else by compulsion' (Froude [3.6], 386–7).

10 For example Isaiah Berlin in 'John Stuart Mill and the Ends of Life' declares that Mill's version of utilitarianism stretches the meaning of utility or happiness 'to the point of vacuity' ([3.4], 181).

11 Compare Ten [3.31], [3.32], Gray [3.7], Berger [3.3], Donner [3.5], etc.

12 Mill distinguishes between the formation of beliefs or opinions and the expression of beliefs or opinions. We may then take the reference to absolute freedom of opinion to apply to the former, which would make the freedom to express opinions nearly but not entirely absolute. This would allow restrictions on freedom of speech mentioned or implied by Mill in the subsequent discussion. On the other hand, it seems reasonable to hold that in *Liberty* Mill had in mind only opinions having to do with the range of subjects he specifically mentions—'practical or speculative, scientific, moral, or theological'. If we take 'practical' to cover social, political and general human affairs, then the specified range of topics will rule out

personal and private matters. Although he did not explicitly canvass it in *Liberty*, Mill did have a notion of privacy in so far as he held that there was no general right on the part of others to enquire into the personal aspects of an individual's life and affairs. During the period of his election to Parliament in 1865, he refused to give any information regarding his religious beliefs on the grounds that 'no one has any right to question another on his religious opinions' (*Later Letters*, *CW*, vol. 16, no. 834; also cf. no. 1324 and the *Autobiography*, 1:274). In 1834, in response to Daniel O'Connell's proposal in his bill regarding freedom of the press that truth should be a justification, Mill declared that 'there are insuperable objections to allowing the details of a person's private conduct' to be aired in public and, in a libel action, made the subject of judicial investigation in order to determine its truth (6:166–7; cf. *Earlier Letters*, *CW* vol. 12, no. 99). The fact that Mill's discussion of the right to free speech in *Liberty* makes no mention of the laws of libel also indicates the exclusion of an area of privacy from the scope of this right.

In *Liberty*, Mill holds that 'opinions lose their immunity, when the circumstances in which they are expressed are such as to constitute their expression a positive instigation to a mischievous act', for example denouncing corn-dealers as oppressors of the poor to an excited mob before a corn-dealer's house (260). Clearly the exclusion here is only nominal in that the case specified is such that the so-called expression of opinion really constitutes an action designed to incite or get others to hurt someone, like throwing the first stone (cf. Ten [3.31], 131ff. and Monro [3.21], 239–40). In 'Law of Libel and Liberty of the Press', one of his earlier publications in the *Westminster Review*, Mill quotes a passage from Montesquieu's *De l'Espirit des Lois* which specifically refers to cases where words, or what is said, by participating in an action take on the character of an action (21:5).

13 Mill divides his case into three parts: where the suppressed opinion is true (and the protected opinion false), where it is false (and the protected opinion true) and where the truth is shared between the conflicting opinions; and he cites different objections to censorship under this division. However, what I have called his central argument clearly covers all these cases and governs in each case the assignment of truth-values to both the protected and the suppressed beliefs.

14 According to C.L.Ten, the assumption of infallibility argument is ambiguous in that Mill sometimes uses it to affirm the necessity of freedom of expression for the actual discovery of true beliefs and sometimes as a condition of rational beliefs ([3.31], 124–6). Perhaps one can say, in Mill's defence, that if there is an ambiguity here it is not significant since, for him, it is only on the basis of the principle of the rationality of beliefs that truth-values are to be assigned in particular cases.

15 Bain points out that Mill's view on freedom of discussion 'works round a central idea… namely, the necessity of taking account of the *negative* to every positive affirmation; of laying down, side by side with every proposition, the counter-proposition' ([3.2], 104).

16 Although Mill generally speaks in terms of the truth or falsity of beliefs and opinions, his central argument applies even in those cases where we may use other (cognate) notions such as 'justified'/'unjustified', 'reasonable'/'unreasonable' etc.

17 This brings to mind Sir Karl Popper's views concerning the character of scientific theories, according to which tests of such theories are to be regarded as attempts to refute them; and a successful test (where such an attempt fails) can only temporarily support the theory since future tests may produce a negative result ([3.25], chapters 1 and 10). It is interesting to find the arch-inductivist invoking elements of the hypothetico-deductive account of knowledge. Still it should be noted that the strength of Mill's defence of freedom of expression is that it presents more or less the same line of thought as what many would regard as an illuminating

and fruitful view of the structure of scientific inquiry (cf. Ryan [3.27], 136ff.).

18 Berlin holds that Mill's account follows from his general empiricist outlook: 'he believed that no truths are—or could be—rationally established except on the evidence of observation. New observations could in principle always upset a conclusion founded on earlier ones' ([3.4], 187).

19 Berlin takes Mill as no more than contemptuously dismissing his opponents here ([3.4], 187). It seems to me that it is more reasonable to take the discussion on pp. 230–43 of *Liberty* as partly constituting an attempted rebuttal of absolutism on these lines. Mill uses historical examples to support his case.

20 [3.30], 76. Other commentators were less discerning. John Morley in an article in *The Fortnightly Review* of August 1873 takes the argument to make the same point as Milton in *Areopagitica* ([3.22], III). But Milton's point is very different from Mill's. Milton's contention is that if censorship is justified on the grounds of protecting people from 'Vice and Error', then how can those who do the censoring avoid these calamities unless it is assumed that *they* are proof against deception and corruption: 'how shall the licensers themselves be confided in, unless we can confer upon them, or they assume above all others in the land, the grace of infallibility and uncorruptedness?' ([3.20], 73). Another misinterpretation is that by John Plamenatz who takes Mill's point to be that those engaged in the business of censorship actually come to believe that they are infallible. He thinks Mill is wrong about this: 'It may be true that men who often silence discussion come, in the end, to believe that they are always right… But this is not nearly enough to establish Mill's point. It does not prove that those who exercise the power only occasionally and under the guidance of a powerful tradition make any such assumption' ([3.24], 127).

21 What Mill had in mind was the prevailing and popular view regarding the social utility of religion. In the *Autobiography* he refers to the 'examination not of the truth, but of the usefulness of religious belief…which, of all the parts of the discussion concerning religion, is the most important in this age, in which real belief in any religious doctrine is feeble and precarious, but the opinion of its necessity for moral and social purposes almost universal' (1:73).

22 Mill's argument, which is not stated too clearly, is to be found on pp. 233–4 of *Liberty*.

23 I take Mill's statement 'it is not the feeling sure of a doctrine…which I call an assumption of infallibility. It is the undertaking to decide that question *for others* without allowing them to hear what can be said on the contrary side' (234) to have this contextual relevance.

24 Or we may take Mill's argument here as addressed to those who do not accept the proposed principle of rationality.

25 The proposal is to be taken seriously in that we can envisage such cases in terms of Mill's non-absolutist conception of truth, namely where beliefs, though open to scrutiny, are not as a matter of fact challenged or discussed.

26 'The words which convey it cease to suggest ideas, or suggest only a small portion of those they were originally employed to communicate' (249). This is the same notion as Locke's 'bare sounds' without any ideas or mental significata annexed to them (*Essay Concerning Human Understanding*, III. 10.26 etc.). The absence of the corresponding ideas is supposed to exclude the so-called belief from the causal or associative mental chains leading to the adoption of attitudes and to action.

27 Mill's view is that it is only by defending the belief and criticizing opposing beliefs that one really grasps its content and meaning.

28 Because its grounds involve the refutation of other opposing beliefs from which it is protected (244–5).

29 Mill is quite vague here: ‘Instead of a vivid conception and a living belief, there only remain a few phrases retained by rote; or, if any part, the shell and husk only of the meaning is retained, the finer essence being lost’ (247).

30 I am not implying that such a belief is true. Mill’s contention that absence of criticism turns a belief into a ‘dead dogma’ will apply also to the adoption of beliefs which are false.

31 Mill makes it quite clear that it is not only for an elite that he advocates freedom of discussion: ‘There have been, and may again be, great individual thinkers in a general atmosphere of mental slavery. But there never have been, nor ever will be, in that atmosphere, an intellectually active people’ (243).

32 The normative character of the criterion is brought out by the fact that *consent* on the part of the affected parties is meant to ensure the self-regarding nature of the relevant actions.

33 Mill is here primarily concerned about the liability of ‘personal errors’ such as intemperance or extravagance to legal and moral penalties. However, the discussion naturally leads him to specify the criteria of self-regarding and other-regarding conduct.

34 The example is not Mill’s. A parallel case he mentions is where someone by damaging his own property supposedly ‘diminishes…the general resources of the community’ (280).

35 Mill’s examples refer to the prohibition on the eating of pork in a Muslim society and of Protestant forms of worship in a Catholic country. Mill does discuss Sabbatarian legislation and restrictions but not in relation to contingent injury.

36 (2) calls for a similar response. But Mill does not adopt it because he takes the view that where individuals directly harm themselves by some form of self-indulgence, the example is likely to make others avoid that kind of conduct because ‘it displays…the painful or degrading consequences…attendant on it’ (283).

37 For a fuller discussion of this feature of self-regarding conduct see Wollheim [3.35] and Ten [3.31], 19ff. Honderich argues that there is no basis for assigning this idea to *Liberty*.

38 ‘There are many who consider as an injury to themselves any conduct which they have a distaste for, and resent it as an outrage to their feelings; as a religious bigot, when charged with disregarding the feelings of others, has been known to retort that they disregarded his feelings, by persisting in their abominable worship or creed. But there is no parity between the feeling of a person for his own opinion, and the feeling of another who is offended at his holding it; no more than between the desire of a thief to take a purse, and the desire of the right owner to keep it’ (283). Ten [3.31] takes this passage to refer to the idea of morality-dependent harm. Honderich [3.14] finds only the last sentence to give off no more than a ring in support of Ten. I draw attention to the passage also because of the implicit reference to rights and duties.

39 Compare ‘Human nature is not a machine to be built after a model, and set to do exactly the work prescribed for it, but a tree, which requires to grow and develop itself on all sides, according to the tendency of the inward forces which make it a living thing’ (263). And: ‘A person whose desires and impulses are his own—are the expression of his own nature, as it has been developed and modified by his own culture—is said to have a character. One whose desires and impulses are not his own, has no character; no more than a steam-engine has a character’ (264). Also compare Mill’s critique of the Calvinistic ‘conception of humanity’ which takes its nature to be bestowed on it for no other purpose than ‘merely to be abnegated’ (265–6). Gertrude Himmelfarb points out that Mill assumed that a larger amount of ‘the raw material of human nature’ meant that though there was a greater potential for evil, there was also a greater potential for good ([3.12], 63).

40 I use ‘autonomous’ to refer to nothing more than the kind of choice (and life) that Mill assigns to the ‘individually spontaneous’ person.

41 ‘He who does anything because it is the custom, makes no choice’ (262).

42 For the distinction between the positive and the negative sense of freedom, see Isaiah Berlin, ‘Two Concepts-of Liberty’, [3.4], 122ff. When Mill refers to freedom of speech it is wholly in the negative sense of freedom from external coercive barriers to expression and discussion of opinion. But where action is concerned, he adds the *further* requirement regarding the character of the choice determining it. Unlike Rousseau and the Hegelian idealists, he does not abandon ‘negative freedom’ in favour of a positive conception.

43 Compare ‘Such are the differences among human beings in their sources of pleasure, their susceptibilities of pain, and the operation on them of different physical and moral agencies, that unless there is a corresponding diversity in their modes of life, they neither obtain their fair share of happiness, nor grow up to the mental, moral, and aesthetic stature of which their nature is capable’ (270). And: ‘In proportion to the development of his individuality, each person becomes more valuable to himself… There is a greater fullness of life about his own existence’ (266). Also compare Wilhelm von Humboldt’s views in *The Sphere and Duties of Government*—which Mill quotes with approval: ‘the end of man…is the highest and most harmonious development of his powers to a complete and consistent whole’ (261). Humboldt contrasts the partial and one-sided development of the individual’s separate human capacities with ‘harmoniously combining them’ so as to achieve an organic unity of life, a ‘union of the past and the future with the present’ ([3.15], 16–17). Cf. Ten [3.31], 73.

44 In *Liberty* Mill refers to ‘the limits imposed by the rights and interests of others’ on freedom of action (266) and speaks of ‘certain interests which either by express legal provision or by tacit understanding ought to be considered as rights’ (276). In the *Autobiography* he assigns to *Liberty* as its ‘leading thought’, ‘the doctrine of the rights of individuality’ (1:260). Cf. Berger [3.3], 229; Donner [3.5], 190–1.

45 ‘Justice is a name for certain classes of moral rules, which concern the essentials of human well-being more nearly, and are therefore of more absolute obligation, than any other rules for the guidance of life; and the notion which we have found to be of the essence of the idea of justice, that of a right residing in an individual implies and testifies to this more binding obligation… The moral rules which forbid mankind to hurt one another (in which we must… include, wrongful interference with each other’s freedom) are more vital to human well-being than any maxims…which only point out the best mode of managing some department of human affairs’ (10:255). J.C.Rees distinguishes self-regarding from other-regarding conduct in terms of actions which *merely affect* others from those which also adversely affect the *interests* of others; and he takes the ‘rules of justice’ to pick out essential or vital human interests ([3.26], chapters 5 and 6).

46 Cf. Berger [3.3], 233; and Donner [3.5], 125—Aristotle conceives of ‘happiness’ or *eudaimonia*, ‘the most final end’, as made up of several elements, each of which is necessary for achieving it, but some of which are more valuable than others; for example, *moral virtue* because while those who possess it may miss out on happiness, still they can never become ‘miserable’ (*Nicomachean Ethics*, I, 7–10). For a discussion of Aristotle’s conception of eudaimonia as an inclusive end see Hardie ([3.10], chapter 2) and Ackrill [3.7].

47 ‘Original’ here means ‘underived, independent, proceeding from the person directly’. Cf. *The Subjection of Women*, 21:314.

48 Mill’s plea that ‘exceptional individuals should be encouraged in acting differently from the mass’ because ‘in this age, the mere example of nonconformity, the mere refusal to bend the knee to custom, is itself a service’ (269) surely covers the exercise of originality in both senses of the term. One can act differently from the mass, and refuse to bend the knee to custom not only by supporting novel beliefs and practices but also by subscribing to beliefs

and practices, whether novel or not, only on the basis of one's own rational assessment: the manifestation of nonconformity can also be seen as the refusal to follow custom just because it is custom or subscribe to opinions just because they are generally acknowledged.

49 Cf. Donner [3.5], 170–1. Fitzjames Stephen asks: 'Was there ever a time or place at which no men could be improved on any point by free discussion?' But he goes on to support a more restrictive interpretation of Mill's criterion which justifies paternalistic intervention in every society ([3.30], 69).

50 Cf. Ten [3.31], no; and chapter 7 for a full and valuable discussion of Mill's rejection of paternalism.

51 Mill declares that people should not be allowed to sell themselves as slaves, or otherwise contract to become someone's slave (299–300). This is sometimes said to be inconsistent with his rejection of paternalism. But we need not take the prevention of people selling themselves into slavery as justified on paternalistic grounds. Mill advocates making any such engagement 'null and void', i.e. not enforceable by law or the pressure of public opinion. Clearly what this is meant to achieve is to prevent anyone else from coercing the individual to act as their slave on the basis of such a contract. The rejection of such contracts then can be taken to fall under the self-protection principle. At the same time, the exclusion of formal slavery contracts does not mean that we should also prevent someone from actually acting and living as another's 'slave' of his or her own free choice (cf. Ten [3.31], 117–19).

52 The distinction Mill seeks to make here, and which he stresses is not 'merely nominal', is designed to show that protecting the area of self-regarding actions from coercive intervention does not preclude us from being concerned with such conduct on the part of others and from judging its worth. The doctrine of *Liberty*, Mill points out, is not one of 'selfish indifference', unconcerned about what happens to others unless one's own interests are involved. Rather, it allows full scope for 'disinterested exertion to promote the good of others. But disinterested benevolence can find other instruments to persuade people to their good, than whips and scourges, either of the literal or the benevolent sort' (276–7) (also cf. 10:246).

53 [3.11], 32–3. With regard to restrictions on the sale of poisons, Mill is concerned about the liberty of the purchaser because some regulations would effectively prevent their purchase: 'to require in all cases the certificate of a medical practitioner, would make it sometimes impossible, always expensive, to obtain the article for legitimate uses' (294). He is not against requiring purchasers to give their name and address and specify the proposed use of the substance, and even when there is no medical prescription to require the presence of a third person to attest to the sale. Mill acknowledges the 'right inherent in society to ward off crimes against itself by antecedent precautions' (295). But he is also concerned that this 'preventive function of government' may be abused 'for there is hardly any part of the legitimate freedom of action of a human being which would not admit of being represented, and fairly too, as increasing the facilities for some form or other of delinquency' (294). It should be noted that Mill is here offering 'not so much applications, as specimens of applications' designed to illustrate the relevant kinds of reasoning entailed by his doctrine

54 The 'general presumptions' Mill has in mind are beliefs of the form 'Most people would or would not want…', 'No one wants…' etc.

55 Cf. Ten [3.31], 116–17; Khan [3.17], 61–5.

56 And, according to Mill, it is only in order to escape from *extreme unhappiness* that one would prefer to abandon a distinctive human existence (10:211).

57 Cf. 'desiring a thing and finding it pleasant, aversion to it and thinking of it as painful, are phenomena entirely inseparable, or rather two parts of the same phenomenon; in strictness of language, two different modes of naming the same psychological fact' (10:237). Mill justifies

the claim on factual grounds; however it should be noted that for him all truths, even those of mathematics, are empirical; and that he goes on to say that 'to desire anything, except in proportion as the idea of it is pleasant, is a physical and metaphysical impossibility' (10:238).

58 According to Mill, the *will* or 'conscious volition…which has become habitual' is to be distinguished from *desire*, and may be directed to ends other than pleasure. But it is still the case that 'will, in the beginning is entirely produced by desire; including in that term the repelling influence of pain as well as the attractive one of pleasure' (10:238–9). (Also cf. *Logic*, 8:842–3).

59 Cf. 'What was once desired as an instrument for the attainment of happiness, has come to be desired for its own sake…as *part* of happiness. The person is made, or thinks he would be made, happy by its mere possession; and is made unhappy by failure to obtain it' (10:236). And: 'Those who desire virtue for its own sake, desire it either because the consciousness of it is a pleasure, or because the consciousness of being without it is a pain, or for both reasons united' (10:237).

60 Another such element is the provision of a sense of security as the outcome of a general acknowledgement and society's protection of individual rights (picked out by the 'rules of justice'—for example protecting people from unjustified infliction of injury and wrongful interference with their freedom). Without security no good can be pursued or enjoyed and no evil confidently averted. For this reason, Mill takes the claim for security to assume a 'character of absoluteness' so that 'indispensability becomes a moral necessity' (10:251). Berger divides the essential elements in Mill's conception of happiness into two basic categories: (1) 'the constituents and requirements for an individual's sense of being his or her own person, of developing one's life as one chooses—a sense of freedom, power, excitement', and 'whatever is necessary to maintain human dignity'. And (2) 'those things requisite for a sense of security, the prime ones being the fulfilment by others of the rules of justice, and their respect for our rights' ([3.3], 40–2). I am greatly indebted here and elsewhere to the late Professor Berger's account of Mill's moral and political views and, in particular, of Mill's concept of happiness. For a discussion of Berger's views see Hoag [3.13] and Ten [3.32].

61 In a letter to Gomperz, the translator of the German edition of *Utilitarianism*, Mill refers to 'the real argument' behind his misleading statement of it and seems to accept the need for dropping the offending analogy (10:cxxvi; and 16:

62 Cf. Skorupski [3.29], 286–7. It seems to be Mill's view that the evidence we are supposed to cite in favour of the desirability of happiness is that it is consistently and generally desired or pursued as an end and also acknowledged or accepted as such on the basis of reflection and rational consideration. If this were the case then, in the absence of a countervailing explanation, we would have a strong argument in favour of the principle of utility.

63 He declares that 'the social feelings of mankind' involve 'the desire to be in unity with our fellow creatures… The social state is at once so natural, so necessary, and so habitual to man, that, except in some unusual circumstances or by an effort of voluntary abstraction, he never conceives himself otherwise than as a member of a body' (10:231). (Cf. Berger [3.3], 44 and 59–61 for a fuller discussion of this aspect of Mill's views.)

64 The argument proceeds on the basis that social life is requisite for the individual's own happiness and a requisite of social life is a concern for the general welfare ([3.3], 59).

65 According to Berger, the proof is addressed to intuitionists who held that our moral *feelings* are the sole foundation of moral obligations and judgements ([3–3], 53–4).

66 But, as Skorupski points out, this is not enough. We need to know on what principles the good of individuals is to be incorporated into the general good ([3.29], 287). (For a

discussion of this and related issues see chapter 9.)

67 Referring to Mill's proof, Berger writes: 'It is tempting…to say that there is a missing premise or assumption here, namely, that Mill believed there is a strong connection between the individual's welfare and the general welfare. Each individual's welfare is *included in* the general welfare, so, if a person desires that person's own welfare, and it is therefore a good to them, the general welfare is also a good to them. Of course, it does not follow that they *desire* the general welfare, because *they* may not see the connection; yet, it will be true that the general welfare is good for them. Moreover, they can come to desire the general welfare when made aware of the connection, especially if social life is requisite for their happiness, and a requisite of social life is a regard for the general welfare' ([3.3], 59). This would make it possible, at least technically, to hold on to the general welfare or happiness as a necessary feature of the moral standard.

68 Part of what Mill says concerning the mechanism of parliamentary government is also to be found in two other essays published in 1859—*Thoughts on Parliamentary Reform* and *Recent Writers on Reform* (19:311ff.). The latter contains a review of Thomas Hare's *A Treatise on the Election of Representatives* (1859) containing the proposal for an electoral system based on proportional representation involving a national quota of votes for entry to parliament together with preferential voting, a scheme that Mill enthusiastically supported. Having, as he thinks, answered objections brought against the scheme, he predicts that its implementation will usher in a new era of parliamentary government (19:453–65). But he does not consider the standard objection that such a system is likely to introduce political instability and allow minorities to wield power out of proportion to their size or importance.

69 He also discusses other matters which cut across this division, such as the forms of government best suited to the rule of colonies by a democracy (19:562ff.).

70 He refers to this as the power of 'self-protection' (19:404, 21:301). However, this feature of democracy has no relation to the self-protection principle mentioned in *Liberty*.

71 See 19:399–403, 467–9. etc.

72 He wants minimum proficiency in the three R's: the voter should be able to 'copy a sentence from an English book, and perform a sum in the rule of three' (19:471). He also stipulates that every voter should be a taxpayer, so that those who elect legislatures will have a special interest in keeping expenditure and taxes down. But to allow most people to qualify under this rule, he recommends that a direct tax in lieu of some existing indirect taxes should be levied on all adults. Other categories of exclusion are undischarged bankruptcy and non-payment of taxes, and 'the receipt of parish relief (19:472).

73 'So long as an opinion is strongly rooted in the feelings, it gains rather than loses in stability by having a preponderating weight of argument against it…; the worse it fares in argumentative contest, the more persuaded its adherents are that their feeling must have some deeper ground, which the arguments do not reach; and while the feeling remains, it is always throwing up fresh entrenchments of arguments to repair any breach made in the old' (21:261).

74 Also cf. 21:273, 280; *Liberty* 301, and *Papers on Women's Rights,* the joint product of Mill and his wife, Harriet, 21:386.

75 Also cf. *Representative Government,* 19:479–81; and 21:386–7.

76 For example, the contention that women's 'greater nervous susceptibility' makes them too impulsive and changeable, incapable of perseverance, uncertain, etc. so that they are not fit for anything but raising a family! Or the view that men are superior to women in mental capacity because they have a larger brain (21:307–12).

77 Another reason for Mill to review these arguments might be the fact that they were

commonly used in public debate and he wants to provide opponents of discrimination with the details regarding their refutation. It should be recognized that Mill saw *The Subjection of Women* to be a manifesto for legal and social reform—as he said in a letter to Bain, he wanted 'to stir up the zeal of women themselves…, excite the enthusiasm in women which is necessary to break down the old barriers' (17:1623).

78 Also cf. 21:302. As part of the social forces which are said to produce female character traits and mental capacities, Mill assigns a central function to 'the education given to women—an education of the sentiments rather than of the understanding and the habits which are the outcome of their restricted life-styles' (21:330). Mill does not deny that the subordination of women may seem to be natural, for: 'unnatural generally means only uncustomary, and… everything that is usual appears natural The subjection of women to men being a universal custom, any departure from it quite naturally appears unnatural' (21:270).

79 Women, according to Mill, are indoctrinated to be submissive and obedient 'by representing to them meekness, submissiveness and resignation of all individual will, into the hands of a man, as an essential part of sexual attractiveness' (21:272). This is reflected in the work of women writers, so that the 'greater part of what women write about women is mere sycophancy to men' (21:279).

80 'its psychological contribution is the book's great achievement: Mill's psychology is grounded in a more lucid distinction between prescription and description than one encounters in Freud, and a far more intelligent grasp of the effects of environment and circumstance. Mill is also sensitive to the mechanisms by which conservative thought construes the status quo into the inevitable' (Millett [3.19], 96). Kate Millett's account of Mill's views as contrasted with those of Ruskin is an important contribution to our understanding of the issues involved ([3.19], 88–108).

81 For example, the 1852 edition of the *Logic* carried a footnote which deplored the common use of the pronoun 'he' to refer to human beings in general, and went on to point out that this was 'more than a defect in language; tending greatly to prolong the almost universal habit, of thinking and speaking of half the human species as the whole'. Although the footnote was deleted in later editions, its existence indicates an awareness on Mill's part of the 'gender-bias' attaching to language ([3.34], 136).

CHAPTER 4
J.S.Mill

Logic and metaphysics

John Skorupski

ENLIGHTENMENT AND ROMANTICISM IN MILL'S PHILOSOPHY

Mill's importance as one of the major figures of nineteenth-century politics and culture, and the current interest in him as a moral and political philosopher, are both so great that they make it hard to see him in another aspect—as a leading contributor to the British tradition of epistemology and metaphysics. Yet it was the *System of Logic* (1843) that first established his reputation; and his views in this field remain as interesting and relevant as his better known views in ethics and politics.

Throughout his intellectual life Mill sought to weave together the insights of enlightenment and Romanticism. He applied Romantic idealism's moral understanding to utilitarianism's concepts of character, imagination and purpose, freedom and reason, human good. To German Romanticism he owes one of his master themes—that of the culture of human nature as a whole, both in its diverse spontaneity and in its rational autonomy. But the metaphysical and psychological foundations of his thought lie securely in the naturalistic empiricism of the British school—and, moreover, in its radical and associationist, rather than its conservative and innatist, wing. Thus the deepest questions about Mill's philosophical success turn on the possibility of such a synthesis, and on how far he achieved it.

Reasons for doubt centre on two great issues, which at bottom are linked. Must not naturalism subvert reason, as Kant thought? And must not a natural science of man—a scientific psychology—subvert the understanding from within, the *moral* psychology of autonomy and expressive spontaneity, which Mill shares with the 'Germano-Coleridgeans' (as he called them)? Both questions lead us to the *System of Logic*, the first to its analysis of deductive and inductive reasoning, the second to its treatment of freedom and determinism. They remain important issues in contemporary philosophy. Beyond these two questions about the coherence of Mill's thought, there is a third—whether his associationist psychology can be reconciled with the idea of determinate human potentiality he requires for his account of 'man as a progressive being'. But this question does not have the direct contemporary significance that the other two have and will not be discussed here.

NATURALISM AND SCEPTICISM

Naturalism is the view that the mind is an entirely natural entity—a part of the natural order. But if the mind is only a part of nature, it seems that no real knowledge of the natural world can be *a priori*. Either all real knowledge is *a posteriori*, grounded in experience, or there is no real knowledge. That this consequence genuinely follows from naturalism Mill and Kant would have agreed. The difference between them was that Mill, unlike Kant, thought that knowledge could be grounded on such a basis. Thus the purpose of the *System of Logic* was, firstly, to spell out the full extent of epistemological empiricism—that is, of the view that all knowledge is *a posteriori*—and, secondly, to show how knowledge is possible on that basis. Its greatest achievement is the radicalism and the rigour with which it presses through to the first of these objectives.

Before we examine the *System* it will be useful to draw some further broad contrasts between Mill, Kant, David Hume and Thomas Reid. Unlike Hume, Kant or even Reid, Mill shows no interest at all in scepticism. He agrees with Kant that naturalism must remove *a priori* grounding from the common-sense principles which Reid presents. He does not agree with Reid that those principles are 'innate', but he also sees—though with less clarity, as we shall see—that even if they were, that would not give them an epistemological, as against a merely psychological, independence of experience. Yet he does not unleash a sceptical attack on reason as Hume does, nor does he see any need to defend reason against such an attack. In fact he sees no crisis of reason, and it is this that sets him apart most fundamentally from the Critical legacy of Kant.

Here he is loyal to his Benthamite inheritance. The Benthamites wished to distance themselves from Hume's scepticism just as firmly as the Scottish common-sensists did—unlike the latter, though, they felt no call to respond systematically to it. Mill agreed with them: in this respect his attitude was English rather than Scottish. More broadly, however, both Mill and Reid belong in that British naturalistic camp which believes that no serious philosophical lesson can be drawn from scepticism. For neither of them thinks—as Hume did—that sceptical arguments are sound and significant, that they show something of negative importance about reason. The difference between them is rather that Reid believes that scepticism stems solely from an erroneous theory of mind, and can be entirely defused by denying the existence of the objects postulated by that theory—ideas—while Mill in contrast never engages with scepticism at all.

If one thinks that scepticism is both unanswerable and unserious this may be the true philosophic wisdom. Whether it is wisdom or evasion is a question which keeps on returning in philosophy. But whatever view one takes on it one will misunderstand the *System of Logic* if one does not grasp that it is a work of what a contemporary philosopher in the same tradition, W.V.O.Quine, has called 'naturalized epistemology'. One of the ways in which it is, is precisely this: that it neither raises nor seeks to answer sceptical questions.

THE ANALYSIS OF LANGUAGE: LOGIC AND MATHEMATICS CONTAIN REAL INFERENCES

Fundamental to the *System* is a distinction Mill draws between 'verbal' and 'real' propositions, and correspondingly, between 'merely apparent' and 'real' inferences. He applies it with greater strictness, and addresses his thesis, that merely apparent inferences have no genuine cognitive content, with greater resolution, than anyone had done before.

We can best reconstruct it by starting with the notion of a merely apparent inference. An inference is merely apparent when no real inferential move has been made. For this to be so, the conclusion must literally have been asserted in the premisses. In such a case, there can be no epistemological problem about justifying the apparent inference—there *is* nothing to justify. A verbal proposition can now be defined as a conditional proposition corresponding to a merely apparent inference. (This is not the whole of Mill's distinction, for he also counts elementary inferences and propositions concerning identity as verbal; but we can ignore that for the moment.)

The distinction corresponds, as Mill himself notes, to that which Kant makes between 'analytic' and 'synthetic'. (Kant formulates it for affirmative predicative propositions, and so does Mill, but the version given in the previous paragraph can be used to avoid this limitation.) But there is also a broader notion of analyticity, which has been influential in this century and which may also be thought to be implicit in some, though not all, of Kant's formulations. It defines an analytic truth as one from whose negation a contradiction can be deduced, with the help, where necessary, of definitional transformations, and using principles of logic alone. In the broad sense of 'analytic', it becomes a trivial truth that logical principles are analytic. But what is then no longer trivial is the crucial thesis that analytic propositions have no genuine cognitive content, and hence pose no epistemological problem.

If we keep to Mill's understanding of the distinction between 'verbal' and 'real', which corresponds to the narrower Kantian notion of analyticity, pure mathematics, and logic itself, contain 'real' propositions and inferences with genuine cognitive content. The clear recognition of this fact is the chief philosophical achievement of the *System of Logic*. For if Mill is also right in holding that naturalism entails that no real proposition is *a priori*, then he has shown the implications of naturalism to be radical indeed. Not only mathematics but logic itself will be empirical.

To demonstrate that logic and mathematics contain real propositions Mill has to embark on an extensive semantic analysis of sentences and terms (he calls them 'names'), of syllogistic logic, and of the so-called 'Laws of Thought'. His analysis has many imperfections and he never unifies it in a fully general account. But he does supply the foundations of such an account, and in doing so takes the empiricist epistemology of logic and mathematics to a wholly new level.

The starting point is a distinction between the denotation and connotation of names. Names, which may be general or singular, denote objects and connote attributes of objects. (Attributes may themselves be denoted by 'abstract' names, though the term is misleading, for Mill conceives attributes nominalistically). A general name connotes

attributes and denotes each object which has those attributes. Most singular names also connote attributes, but their grammatical construction indicates that they denote just one object if they denote at all.

There is however an important class of singular names—'proper names' in the ordinary sense, such as 'Dartmouth'—which denote an object without connoting any property. Identity propositions which contain only such non-connotative names, as 'Tully is Cicero', are in Mill's view verbal. They lack content in the sense that, according to Mill, the only information conveyed is about the names themselves: 'Tully' denotes the same object as 'Cicero' does. Mill's point is that there is no fact in the world to which 'Cicero is Tully' corresponds; a thought similar to that which inspired Wittgenstein's treatment of identity in the *Tractatus*. The obvious difficulty about assimilating them to verbal propositions on this basis is that knowledge that Cicero is Tully is not *a priori*. We cannot know the proposition to be true just by reflecting on the meaning of the names—whereas Mill's overall inten-tion is that the class of verbal propositions should be identical with the class of propositions which are innocuously *a, priori because* empty of content. He does not seem to notice this difficulty.

The meaning of a declarative sentence—'the import of a proposition'—is determined by the connotation, not the denotation, of its constituent names; the sole exception being connotationless proper names, where meaning is determined by denotation. (Again there is something puzzling here, for it needs to be explained how this thesis about the meaning of proper names is to be reconciled with the aposteriority of 'Cicero is Tully'.) Mill proceeds to show how the various syntactic forms identified by syllogistic theory yield conditions of truth for sentences of those forms, when the connotation of their constituent names is given.

Armed with this analysis he argues that logic contains real inferences and propositions. (He assumes that to assert a conjunction, *A and B,* is simply to assert *A* and to assert *B.* He defines *A or B* as 'If not *A,* then *B,* and if not *B,* then *A*'. 'If *A* then *B*' means, he thinks, 'The proposition *B* is a legitimate inference from the proposition *A*'.)

His strategy is an admirably forceful pincer movement. One pincer is an indirect argument. If logic did not contain real inferences, all deductive reasoning would be a *petitio principii,* a begging of the question—it could produce no new knowledge. Yet clearly it does produce new knowledge. So logic must contain real inferences. The other pincer is a direct semantic analysis of the supposed 'axioms' of syllogistic reasoning and of the laws of thought. It shows them to be real and not merely verbal.

The execution of this strategy is flawed, because Mill mixes it up with an interesting but distinct objective. He wants to show that 'all inference is from particulars to particulars'. The point is to demystify the role general propositions play in thought. He argues that in principle they add nothing to the force of an argument; particular conclusions could always be derived inductively direct from particular premisses. Their value is psychological. They play the role of 'memoranda', summary records of the inductive potential of all that we have observed, and they facilitate 'trains of reasoning' (as e.g. in 'This is *A,* all *A*s are *B*s, no *B*s are *C*s, so this is not *C*'). Psychologically they greatly increase our memory and reasoning power, but epistemologically they are dispensable.

As Mill presents it, this thesis is tied in with his rejection of 'intuitive' knowledge of

general truths and with his inductivism (which we shall come to shortly). For it assumes the illegitimacy of *hypothesizing* general propositions, as against generalizing to them from observation of singular conjunctions. Beneath this, however, there lies a deeper and obscurer sense in which a radical empiricist must hold that all inference is from particulars to particulars. For consider the inference from 'Everything is *F*' to '*a* is *F*'. Is it a real or merely apparent inference? It is impossible to hold it real if one also wishes to argue that real inferences are *a, posteriori*. But the only way of treating it as verbal which is open to Mill is to treat the premiss as a conjunction: '*a* is *F* and *b* is *F* and…' If that approach is precluded then all that remains is to deny that 'Everything is *F*' is prepositional—it must, rather, express an inferential commitment.

Both approaches are very close to the surface in Mill's discussion of the syllogism, and he comes closest to the latter when he emphasizes that a general proposition is 'a memorandum of the nature of the conclusions which we are prepared to prove'. But these issues about generality (and about conditional propositions) do not emerge clearly in his analysis; like his treatment of proper names and of identity, they were destined to make a decisive appearance on the agenda of philosophical logic only later, in the twentieth century.

MILL'S EMPIRICIST VIEW OF LOGIC, GEOMETRY AND ARITHMETIC

Though Mill's treatment of generality and the syllogism is somewhat confused and opaque, he is quite clear cut in holding the laws of contradiction and excluded middle to be real—and therefore *a posteriori*—propositions. He takes it that 'not *P*' is equivalent in meaning to 'it is false that *P*'; if we further assume the equivalence in meaning of *P* and 'It is true that P', the principle of contradiction becomes, as he puts it, 'the same proposition cannot at the same time be false and true'. 'I cannot look upon this' he says 'as a merely verbal proposition. I consider it to be, like other axioms, one of our first and most familiar generalizations from experience.' He makes analogous remarks about excluded middle, which turns—on these definitions—into the principle of bivalence, 'Either it is true that *P* or it is false that *P*'.

A truly radical empiricism! After this it is not surprising to find the same broad strategy applied to mathematics. If it was merely verbal, mathematical reasoning would be a *petitio principii*. Moreover a detailed semantic analysis shows that it does contain real propositions.

Mill provides brief but insightful empiricist sketches of geometry and arithmetic. On geometry he is particularly good. The theorems of geometry are deduced from premisses which are real propositions inductively established. (Deduction is itself of course a process of real inference.) These premisses, where they are not straightforwardly true of physical space, are true in the limit. Geometrical objects—points, lines, planes—are ideal or 'fictional' limits of ideally constructible material entities. Thus the real empirical assertion underlying an axiom such as 'Two straight lines cannot enclose a space' is something like 'The more closely two lines approach absolute breadthlessness and straightness, the smaller the space they enclose'.

Mill applies his distinction between denotation and connotation to show that

arithmetical identities such as ‘Two plus one equals three’ are real propositions. Number terms denote ‘aggregates’ and connote certain attributes of aggregates. (He does not say that they denote those attributes of the aggregates, though perhaps he should have done.) ‘Aggregates’ are natural not abstract entities—‘collections’ or ‘agglomerations’ individuated by a principle of aggregation. This theory escapes some of the famous but rather unfair criticisms Frege later made of it, but its viability none the less remains extremely doubtful. The trouble is that the respects in which aggregates have to differ from *sets* if they are to be credibly natural, and not abstract, entities are precisely those in which they seem to fail to produce a fully adequate ontology for arithmetic. (One can for example number numbers, but can there be aggregates of aggregates, or of attributes of aggregates, if aggregates are natural entities?)

However this may be, Mill’s philosophical programme is clear. Arithmetic, like logic and geometry, is a natural science, concerning a particular department of the laws of nature—those concerning the compositional properties of aggregates. The upshot is that the fundamental principles of arithmetic and geometry, as well as of logic itself, are real. Given epistemological empiricism, it follows that deductive reasoning, ‘ratiocination’, is empirical. Mill has provided the first thoroughly naturalistic analysis of meaning and of deductive reasoning itself.

He distinguishes his own view from three others—‘conceptualism’, ‘nominalism’ and ‘realism’.

‘Conceptualism’ is his name for the view which takes the objects studied by logic to be psychological states or acts. It holds that names stand for ‘ideas’ which make up judgements and that ‘a proposition is the expression of a relation between two ideas’. It confuses logic and psychology by assimilating propositions to judgements and attributes of objects to ideas. Against this doctrine Mill insists that

> All language recognises a difference between a doctrine or opinion, and the fact of entertaining the opinion; between assent, and what is assented to… Logic, according to the conception here formed of it, has no concern with the nature of the act of judging or believing; the consideration of that act, as a phenomenon of the mind, belongs to another science.
>
> (7:87)

He traces conceptualism to the seventeenth century: it was introduced by Descartes, fostered by Leibniz and Locke, and has obscured the true status of logic—which is simply ‘the Science of Science’—ever since.

The nominalists—Mill cites Hobbes—hold that logic and mathematics are entirely verbal. Mill takes this position much more seriously than conceptualism and seeks to refute it in detail. His main point is that nominalists are able to maintain their view only because they fail to distinguish between the denotation and the connotation of names, ‘seeking for their meaning exclusively in what they denote’ (7:91).

Nominalists and conceptualists both hold that logic and mathematic can be known non-empirically, while yet retaining the view that no real proposition about the mind-independent world can be so known—but both are confused. But what if one abandons the thesis that no real proposition about the mind-independent world can be known *a*

priori? The realists do that—they hold that logical and mathematical knowledge is knowledge of universals existing in an abstract Platonic domain; the terms that make up sentences being signs that stand for such universals. This is the view Mill takes least seriously—but versions of it were destined to stage a major revival in philosophy, and semantic analysis would be their main source.

In fact in the contemporary use of the term, Mill is himself a nominalist—he rejects abstract entities. That is why he treats aggregates as concrete objects, and attributes as natural properties rather than universals. But, just as severe difficulties lie in the way of treating the ontology of arithmetic in terms of aggregates rather than classes, so there are severe difficulties in the way of treating the ontology of general semantics without appealing to universals and classes, as well as to natural properties and objects. We can have no clear view of how Mill would have responded to these difficulties had they been made evident to him. But we can I think be fairly sure that he would have sought to maintain his nominalism.

However, the central target of Mill's attack is the doctrine that there are real *a priori* propositions. What, he asks, in practice goes on, when we hold a real proposition to be true *a priori*? We find its negation inconceivable, or that it is derived, by principles whose unsoundness we find inconceivable, from premisses whose negation we find inconceivable. Mill is not offering a definition of what is meant by such terms as *'a priori'*, or 'self-evident'; his point is that facts about what we find inconceivable are all that lends colour to the use of these terms.

They are facts about the limits, felt by us from the inside, on what we can imagine perceiving. Mill thought he could explain these facts about unthinkability, or imaginative unrepresentability, in associationist terms, and spent many pages claiming to do so. They are not very convincing pages, but that does not affect his essential point, which is this: the step from our inability to represent to ourselves the negation of a proposition, to acceptance of its truth, calls for justification. Moreover, the justification *itself* must be *a, priori* if it is to show that the proposition is known *a, priori.* (Thus Mill is prepared for example to concede the reliability of geometrical intuition: but he stresses that its reliability is an empirical fact, itself known inductively.)

At this point, Kant could agree. To vindicate the possibility of synthetic *a priori* knowledge calls, he claims, for nothing less than transcendental idealism. But without synthetic *a priori* knowledge, knowledge as such becomes impossible. The very possibility of knowledge requires that there be *a priori* elements in our knowledge.

THE METHODS OF INDUCTION AND THEIR STATUS

The *System of Logic* in contrast sets out to vindicate in general terms the possibility of a scheme of scientific knowledge which appeals at no point whatever to an *a priori* principle. One point in the opposition between *Critical* and *naturalistic* epistemology, as we have noticed, is the latter's refusal to take seriously pure sceptical arguments; but naturalistic epistemology also has two other ingredients—an appeal to a natural, or in Mill's word 'spontaneous', agreement in propensities to reason, and what may be called an 'internal' vindication of these fundamental reasoning propensities. All three

ingredients are present in the *System of Logic*.

For Mill, the basic form of reasoning—epistemologically, historically and psychologically—is enumerative induction, simple generalization from experience. This is the diposition to infer to the conclusion that all *A*s are *B* from observation of a number of *A*s which are all *B*. (Or to the conclusion that a given percentage of all *A*s are *B* from observation of that percentage of *B*s among a number of *A*s.) We spontaneously agree in reasoning that way, and in holding that way of reasoning to be sound. The proposition 'Enumerative induction is rational' is not a verbal proposition. But nor is it grounded in an *a priori* intuition. All that Mill will say for it is that people in general, and the reader in particular, in fact agree on reflection in accepting it. It is on that basis alone that he rests its claim.

Mill's problem of induction, the problem *he* wants to solve, is not Hume's. In sidestepping the purely sceptical question about induction, Mill uses the analogy of a telescope which Thomas Reid had also used in a similar context—though in Reid the telescope is Reason as against Common Sense, while in Mill it is Scientific as against spontaneous induction:

> Assuredly, if induction by simple enumeration were an invalid process, no process grounded on it would be valid; just as no reliance could be placed on telescopes, if we could not trust our eyes. But though a valid process, it is a fallible one, and fallible in very different degrees: if therefore we can substitute for the more fallible forms of the process, an operation grounded on the same process in a less fallible form, we shall have effected a very material improvement. And this is what scientific induction does.
>
> (7:567–8)

Mill's aim is to provide the telescope. The problem he starts from is not a sceptical but an internal one—why is it that some inductions are more trustworthy than others?

> Why is a single instance, in some cases, sufficient for a complete induction, while in others, myriads of concurring instances, without a single exception known or presumed, go such a very little way towards establishing a universal proposition? Whoever can answer this question…has solved the problem of induction.
>
> (7:314)

Mill's answer takes the form of a natural history of the 'inductive process'. The point is to show how that process is internally vindicated by its actual success in establishing regularities, and how it eventually gives rise to more searching methods of investigation.

Mankind begins with 'spontaneous' and 'unscientific' inductions about particular unconnected natural phenomena or aspects of experience. Generalizations accumulate, interweave and are found to stand the test of time: they are not disconfirmed by further experience. As they accumulate and interweave, they justify the second-order inductive conclusion that *all* phenomena are subject to uniformity, and, more specifically, that all have discoverable sufficient conditions. In this less vague form, the principle of general

uniformity becomes, given Mill's analysis of causation, the Law of Universal Causation. This conclusion in turn provides (Mill believes) the grounding assumption for a new style of reasoning about nature—eliminative induction.

In this type of reasoning, the assumption that a type of phenomenon has uniform causes, together with a (revisable) assumption about what its possible causes are, initiates a comparative inquiry in which the actual cause is identified by elimination. Mill formulates the logic of this eliminative reasoning in his well-known 'Methods of Empirical Inquiry'. His exposition is rather garbled but he was right to be proud of it, for it did show how effective eliminative reasoning can be. His picture of the interplay between enumerative and eliminative reasoning, and of the way it entrenches, from within, our rational confidence in the inductive process, is elegant and penetrating.

The improved scientific induction which results from this new style of reasoning spills back on to the principle of Universal Causation on which it rests, and raises its certainty to a new level. That in turn raises our confidence in the totality of particular enumerative inductions from which the principle is derived. In short, the amount of confidence with which one can rely on the 'inductive process' as a whole depends on the point which has been reached in its natural history—though the confidence to be attached to particular inductions always remains variable.

The fundamental norm of scientific reasoning, enumerative induction, is not a merely verbal principle. But what can it mean to deny that it is *a priori*? Mill says that we learn 'the laws of our rational faculty, like those of every other natural agency', only by 'seeing the agent at work'. He is quite right: we can find out what our most basic reasoning dispositions are, only by critical reflection on our practice. This reflective scrutiny of practice is, in a *certain* sense, an *a posteriori* process. It examines dispositions which we have before we examine them. Having examined our dispositions, we reach a reflective equilibrium in which we endorse some—and perhaps reject others. We endorse them as sound norms of reasoning.

But at this point the sceptic will ask by what right we do so—and Mill rules his question out of order. So denying that the fundamental principle of induction is *a priori* comes down, it seems, to just that ruling. Might it not just as well have been said that the principle is *a priori*? But that would suggest that there was some further story, Platonic or transcendental, to be had, which explained and legitimated our reasoning practice, and *this* is what Mill denies.

So too does the sceptic: the fact that the sceptic and the naturalist agree on that hardly shows why it is all right to rule the sceptic's question out of order. It seemed obvious to Mill's epistemological critics, whether they were realists or post-Kantian idealists, that this was evasive: naturalism could seem to differ from scepticism only by being uncritical.

Where Hume launches a sceptical assault on reason, Mill opens up *all* our beliefs to an empirical audit. Hume takes deduction for granted and raises sceptical questions about induction. Mill takes the legitimacy of natural reasoning propensities for granted, but he questions the aprioricity of deduction. Hume and Mill are both naturalistic radicals—but in quite different ways. Mill leaves no real principle of deduction, no common-sense belief entrenched—with one telling exception. The exception is our disposition to rely on the deliverances of memory, which he acknowledges, in the manner of Thomas Reid, to

be ‘ultimate’. But, with this exception, the only ultimate principle that survives in Mill’s science of science is enumerative induction. The whole of science, he thinks, can be built by this single instrument.

HYPOTHESIS

This is Mill’s *inductivism*—the view that enumerative induction is the only *ultimate* method of inference which puts us in possession of new truths. Is he right in thinking it to be so? The question produced an important, if confused, controversy between him and William Whewell (1794–1866). Their disagreement concerned the role of hypotheses. Whewell argued that the Hypothetical Method was fundamental in scientific inquiry: the method in which one argues to the truth of an hypothesis from the fact that it would explain observed phenomena.

Mill had read Whewell’s *History of the Inductive Sciences* (1837), and he could hardly fail to be aware of the pervasiveness of hypotheses in the actual process of inquiry, or of their indispensableness in supplying working assumptions—their ‘heuristic’ value, Whewell called it. The same point—the indispensableness of hypotheses in providing lines of inquiry—had been emphasized by the Frenchman Auguste Comte, with whose *Cours de philosophie positive* (which began to appear in 1830) Mill was also familiar. But what Mill could not accept was that the mere fact that an hypothesis accounted for the data *in itself* provided a reason for thinking it true. He denied that the Hypothetical Method constituted, in its own right, a method of arriving at new truths from experience.

Yet Whewell’s appeal was to the actual practice of scientific reasoning, as observed in the history of science. An appeal of that kind was precisely what Mill, on his own naturalistic principles, could not ignore. The disposition to hypothesize is spontaneous, so why should it not be recognized as a fundamental method of reasoning to truth, as enumerative induction is?

Mill’s refusal to recognize it is not arbitrary. The essential point underlying it is a powerful one: it is the possibility that a body of data may be explained equally well by more than one hypothesis. What justifies us in concluding, from the fact that a particular story would, if true, explain the data, that it is a true story? Other stories may equally explain the data.

Mill places great emphasis on the increasingly deductive and math-ematical organization of science—that is quite compatible with his inductivism, and indeed central to it. But he takes the ‘Deductive Method’ of science to involve three steps: ‘induction’, ‘ratiocination’, and ‘verification’. A paradigm, in his view, is Newton’s explanation of Kepler’s laws of planetary motion. Induction establishes causal laws of motion and attraction, ratiocination deduces lower level regularities from them in conjunction with observed conditions, and verification tests these deduced propositions against observation. (Though this was not, and did not need to be, the historical order of inquiry.) But

> the Hypothetical Method suppresses the first of the three steps, the induction to ascertain the law; and contents itself with the other two operations, ratiocination

> and verification; the law which is reasoned from being assumed, instead of proved.
>
> (7:492)

Mill agrees that it is legitimate to do this when the hypothesis in question has effectively been shown, by eliminative reasoning, to be the only one consistent with the facts. He allows various other cases of apparently purely hypothetical reasoning which are, in his view, genuinely inductive.

When all such cases have been taken into account, we are left with pure cases of the Hypothetical Method, in which the causes postulated are not directly observable, and not simply because they are assumed to operate—in accordance with known laws, inductively established—in regions of time or space too distant to observe. What are we to say of such hypotheses? For example of the 'emission' theory, or the 'undulatory' theory of light? They cannot be accepted as inductively established truths, not even as probable ones:

> an hypothesis of this kind is not to be received as probably true because it accounts for all the known phenomena; since this is a condition sometimes fulfilled tolerably well by two conflicting hypotheses; while there are probably many others which are equally possible, but which from want of anything analogous in our experience, our minds are unfitted to conceive.
>
> (7:500)

Such an hypothesis can suggest fruitful analogies, Mill thinks, but cannot be regarded as yielding a new truth itself. The data do not determine a unique hypothesis: it is this possibility, of underdetermination, which stops him from accepting hypothetical reasoning as an independent method of achieving truth, even though it is a mode of reasoning as spontaneous as enumerative induction.

In seeing the difficulty Mill is certainly on sound ground. What he does not see, however, is how much must be torn from the fabric of our belief if inductivism is applied strictly. Thus, for example, while his case for empiricism about logic and mathematics is very strong, it is his methodology of science which then forces him to hold that we know basic logical and mathematical principles only by an enumerative induction. And that is desperately implausible.

So it is an important question whether the difficulty can be resolved—and whether it can be resolved within a naturalistic framework, which does not yield to idealism. If naturalism can endorse the hypothetical method, it can develop a more plausible empiricism about logic and mathematics than Mill's. But the ramifications of his inductivism are even wider, as becomes apparent if we turn to his general metaphysics.

THE DOCTRINE OF THE RELATIVITY OF KNOWLEDGE

Mill sets this out in his *Examination of Sir William Hamilton's Philosophy* (1865). Sir William Hamilton (1791–1856) was a Scotsman who sought to moderate the views of

Reid and Kant. He was a philosopher of subtlety and erudition (or even pedantry), the last eminent representative of the school of Scottish common sense, and a ferocious controversialist. Mill deemed him a pillar of the right-thinking intellectual establishment, ripe for demolition. But by the time the *Examination* appeared Hamilton's death had made it impossible for him to reply—a fact which predictably caused Mill some regret. For the present-day reader, however, what is more regrettable is that Mill's discussion of general metaphysical issues should be cast in so polemical a form. It means that important issues, particularly on the nature of logic and thought, remain shrouded in obscurity. Mill does however give himself space to develop his view of our knowledge of the external world.

He begins by expounding a doctrine which he rightly takes to be generally accepted (in his time) on all sides. It affirms

> that all the attributes which we ascribe to objects, consist in their having the power of exciting one or another variety of sensation in our minds; that an object is to us nothing else than that which affects our senses in a certain manner; that even an imaginary object is but a conception, such as we are able to form, of something which would affect our senses in some new way; so that our knowledge of objects; and even our fancies about objects, consist of nothing but the sensations which they excite, or which we imagine them exciting, in ourselves.
>
> (9:6)

This is 'the doctrine of the Relativity of Knowledge to the knowing mind'. But there are two forms in which it may be held.

> According to one of the forms, the sensations which, in common parlance, we are said to receive from objects, are not only all that we can possibly know of the objects, but are all that we have any ground for believing to exist. What we term an object is but a complex conception made up by the laws of association, out of the ideas of various sensations which we are accustomed to receive simultaneously. There is nothing real in the process but these sensations.
>
> (9:6)

According to the other,

> there is a real universe of 'Things in Themselves,' and… whenever there is an impression on our senses, there is a 'Thing in itself,' which is behind the phaenomenon, and is the cause of it. But as to what this Thing *is* 'in itself,' we, having no organs except our senses for communicating with it, can only know what our senses tell us; and as they tell us nothing but the impression which the thing makes upon *us*, we do not know what it is *in itself* at all. We suppose (at least these philosophers suppose) that it must be something 'in itself, but all that

> we know it to be is merely relative to us, consisting in the power of affecting us in certain ways.(9:7)

The first form (omitting from it the appeal to laws of association) corresponds to what is meant by 'phenomenalism' as the term is often used by philosophers today—though it was not so used in Mill's time.

Reid's point, that sensations are not representative mental images but states of mind, does not contradict the doctrine of the Relativity of Knowledge, any more than his thesis that we perceive physical objects does. For on his account sensations, states of sensory consciousness, do mediate between the objects that excite them and the beliefs about those objects which are prompted by them—they are themselves distinct from both the objects and the beliefs. I cannot perceive without sensing. But I can sense without perceiving. For example I may have a visual sensation which prompts me to believe that I am seeing a red triangle on a green field. It is then apparently true to say, in an obvious and legitimate sense, that what I am immediately aware or conscious of is my visual sensation. That remains true even if I am perceiving no red triangle because no red triangle exists. Or, if one objects to talk of consciousness *of* a state of consciousness, one may simply say that my immediate visual consciousness is of a red triangle on a green field—in a sense in which that can be true though there is no such triangle.

This is already enough to make epistemology, in Mill's phrase, the 'Interpretation of Consciousness'. The very fact of consciousness seems to impose the doctrine of the Relativity of Knowledge. To escape it, something more counter-intuitive would be required than the sensible points Reid makes about perception and sensation. It is notoriously difficult to pin down what that might be. Perhaps what is needed is nothing less than a denial that sensation is a category ontologically distinct from that of judgement and dispositions to judge: there is no irreducible category of Pure Experience. But Mill, at any rate, questions the irreducible status of sensation no more than Reid did. And he thinks it must follow that—whether or not we *actually* make an inductive inference from sensations to objects beyond sensation—such an inference is, epistemologically speaking, *required*.

Is this too hasty? Is it dogmatism on Reid's part simply to point out that we do form particular beliefs prompted by particular sensations, beliefs which we just do regard as rational? Cannot these specific cognitive dispositions be defended naturalistically, if the general disposition to make enumerative inductions can? But there is a difference. If we are immediately conscious only of states of affairs of one kind (our own sensory states) and on that basis form beliefs about states of affairs of a *quite distinct* kind (states of external physical objects) then some warrant is required. Reid needs to show why such a warrant does not have to rely on inductive inference—even though it licenses a belief in a state of affairs on the basis of immediate consciousness of a *quite distinct* state of affairs. He must call on warrants which are neither deductive nor inductive. And this requires support from ideas in the theory of meaning which had not yet been formed. We shall return to the point.

MATTER AND MIND

Mill sets about the notion of an ‘external’ object in great style:

> What is it we mean, or what is it which leads us to say, that the objects we perceive are external to us, and not a part of our own thoughts? We mean, that there is concerned in our perceptions something which exists when we are not thinking of it; which existed before we had ever thought of it, and would exist if we were annihilated; and further, that there exist things which we never saw, touched, or otherwise perceived, and things which have never been perceived by man. This idea of something which is distinguished from our fleeting impressions by what, in Kantian language, is called Perdurability; something which is fixed and the same, while our impressions vary; something which exists whether we are aware of it or not, and which is always square (or of some other given figure) whether it appears to us square or round—constitutes altogether our idea of external substance. Whoever can assign an origin to this complex conception, has accounted for what we mean by the belief in matter.
>
> (9:178–9)

To assign this origin Mill postulates

> that after having had actual sensations, we are capable of forming the conception of Possible sensations; sensations which we are not feeling at the present moment, but which we might feel, and should feel if certain conditions were present, the nature of which conditions we have, in many cases, learnt by experience.
>
> (9:177)

> These various possibilities are the important thing to me in the world. My present sensations are generally of little importance, and are moreover fugitive: the possibilities, on the contrary, are permanent, which is the character that mainly distinguishes our idea of Substance or Matter from our notion of sensation. These possibilities, which are conditional certainties, need a special name to distinguish them from mere vague possibilities, which experience gives no warrant for reckoning upon. Now, as soon as a distinguishing name is given, though it be only to the same thing regarded in a different aspect, one of the most familiar experiences of our mental nature teaches us, that
> the different name comes to be considered as the name of a different thing.
>
> (9:179–80)

We may speak of *sensation conditionals* of the form, ‘If such and such sensations were to occur, then such and such other sensations would occur with a given degree of probability’. (It need not always be certainty.) They express Mill’s famous ‘Permanent

Possibilities of Sensation'. 'Permanent' is slightly misleading, for there is of course a change in the 'Permanent' possibilities of sensation whenever there is change in the world. Mill also uses other terms—'certified', 'guaranteed'.

We regularly find that whole clusters of sensation conditionals are true together, whenever some other sensory condition obtains. Thus whenever we experience that condition, we are justified in forming all the conditional expectations expressed in that cluster of conditionals. Moreover, as well as finding simultaneous correlations between certified possibilities of sensation, that is, between the truth of any sensation conditional in a set and the truth of any other in the set, we also find 'an Order of succession'. Whenever a given cluster of certified possibilities of sensation obtains, then a certain other cluster follows—a certain other set of sensation conditionals *becomes* true. 'Hence our ideas of causation, power, activity…become connected, not with sensations, but with groups of possibilities of sensation' (9:181).

But even if our reflective concept of matter—as the external cause of sensations—can be explained on psychological principles, it remains open for someone to accept the proposed *origin* for the concept, while also holding that good grounds can be given for thinking it to have instances. He or she will say that a legitimate inference can be made from the existence of the Permanent Possibilities and their correlations to the existence of an external cause of our sensations. It is at just this point that Mill's inductivism comes in. Such an inference would be a case of hypothetical reasoning, to an explanation of experience which transcended all possible data of experience; and that is just what Mill rejects: 'I assume only the tendency, but not the legitimacy of the tendency, to extend all the laws of our own experience to a sphere beyond our experience' (9:187). So the conclusion that matter is the permanent possibility of sensation follows from the combination of the doctrine of the Relativity of Knowledge and inductivism.

If matter is the permanent possibility of sensation, what is mind? Mill considers that 'our knowledge of mind, like that of matter, is entirely relative'. Can the mind then also be resolved into 'a series of feelings, with a background of possibilities of feeling'? He finds in this view a serious difficulty: to remember or expect a state of consciousness is not simply to believe that it has existed or will exist; it is to believe that *I myself* have experienced or will experience that state of consciousness.

> If, therefore, we speak of the Mind as a series of feelings, we are obliged to complete the statement by calling it a series of feelings which is aware of itself as past and future; and we are reduced to the alternative of believing that the Mind, or Ego, is something different from any series of feelings, or possibilities of them, or of accepting the paradox, that something which *ex hypothesi* is but a series of feelings, can be aware of itself as a series.
>
> (9:194)

Mill is unwilling to accept 'the common theory of Mind, as a so-called substance': nevertheless, the self-consciousness involved in memory and expectation drives him to 'ascribe a reality to the Ego—to my own Mind—different from that real existence as a Permanent Possibility, which is the only reality I acknowledge in Matter' (9:208).

If we discount, this conscientious uncertainty about what to say of the self, the

tendency of Mill's analysis is towards the view that all that exist are experiences in a temporal order. Yet he claims, like others before and after him, that this metaphysics is consistent with common-sense realism about the world. Phenomenalism, he thinks, leaves common sense and science untouched. In particular, minds and experiences are still properly to be seen as a part of the natural order.

But are the experiences referred to, in the phenomenalist's analysis, the very same as those referred to in common sense and scientific talk (call this 'naturalistic' talk)? If they are not, then we have yet to be told *what* they are. Then suppose they are the same. In naturalistic talk, we make reference to subjects and their experiences—and also to physical objects and their properties. Psychology, including Mill's psychology, seeks to establish causal correlations among experiences and their physiological antecedents and consequents.

But if phenomenalism is right, only the experiences are real. Mill thinks we are led to that by the very standards of reasoning recognized in a naturalistic 'science of science', or 'system of logic'. If he is right, then the naturalistic vision of the world, which sees minds as part of a larger causal order, is self-undermining. For if we are led to the conclusion, that only states of consciousness are real, *by an application of naturalism's own standards,* then that conclusion has to be understood *on the same level* as the naturalistic affirmation that states of consciousness are themselves part of a larger causal order external to them—and therefore as inconsistent with it. Causal relations cannot exist between fictional entities which are mere markers for *possibilities* of sensation.

So either naturalism undermines itself or there is something wrong with Mill's inductivist analysis of our natural norms of reasoning, or with his endorsement of the doctrine of the Relativity of Knowledge, or both. It is not our business to diagnose the situation further here. But it should not be assumed that Mill's most fundamental tenet—his naturalistic view of the mind—can be safeguarding solely by rejecting inductivism and endorsing the hypothetical method. The result would be a philosophy which postulates the external world as an inference to an hypothetical explanation of pure experience. Something still fails to ring true in that. More is needed: backing for the view mentioned earlier, a view which may be thought of as in the spirit of Thomas Reid, though he did not give it the necessary backing—the view, namely, that there are norms which are neither inductive nor deductive, but which defeasibly warrant experience-based assertions about the physical world.

MORAL FREEDOM

The necessary backing, showing how such defeasible warrants can obtain, could be provided only by a philosophy which treats concepts, and the meanings of expressions in a language, as constituted by rules of use. This conception of concept and meaning is not present in Mill, though it could be reached by a sound progression from his naturalistic analysis of logic, and his rejection of conceptualism, nominalism and realism. Its growth can probably best be dated to the next generation of philosophers after Mill, and to the agenda of problems which they developed (partly at least in response to and reaction against Mill) at the end of the century; thus, to pragmatism, empirio-criticism, as also in

some respects to neo-Kantianism and British idealism. That same conception opens up the possibility of new responses to Mill's problem about the method of inference to the best hypothetical explanation—which was that in cases of genuine hypothesis we cannot be certain that there *is* a single best explanation.

Though the roots of the required conception of concept and meaning date to that period, how best to formulate it is still an open issue. Moreover the most difficult (though not unconnected) question for the naturalist, that of giving an account of reasons, still remains. As we have seen, it stands out as an obstacle for Mill when he needs to account for the authority of fundamental norms of reasoning. And it also stands out when he tries to show how, on the naturalistic view, it is possible for human beings to be morally free.

This was a central issue for Mill. He deals with it as it appears in the classic question of freedom and determinism. His commitment to determinism was complete. But the conclusion drawn by others from that doctrine, that we have (in Mill's phrase) no 'power of self-formation', and hence are not responsible, properly speaking, for our character or our actions, would have destroyed the very centre of his moral convictions. Power to determine one's own purposes and hold to them, responsibility for one's actions, are at the heart of Mill's ideal of life. 'Moral freedom', the ability to bring one's desires under the control of a steady rational purpose, is a condition of self-realization, of having a character in the full sense at all.

So he must show how causally conditioned natural objects can also be rationally autonomous agents. The sketch of a compatibilist solution which he provides in the *System of Logic* is brief but penetrating. He thought it the best chapter in the book. It is certainly a worthy contribution to the great empiricist tradition, which dismisses the problem as a perennially tempting confusion, to be dissolved by careful analysis.

To describe determinism as the doctrine of 'Philosophical Necessity' is, Mill thinks, misleading. Not just because of the general empiricist point that causation is not compulsion but for a more subtle reason; because 'in common use' only causes which are *irresistible*, whose operation is 'supposed too powerful to be counteracted at all' are called necessary:

> There are physical sequences which we call necessary, as death for want of food or air; there are others which, though as much cases of causation as the former, are not said to be necessary, as death from poison, which an antidote, or the use of the stomach-pump, will sometimes avert…human actions are in this last predicament: they are never (except in some cases of mania) ruled by any one motive with such absolute sway, that there is no room for the influence of another.
>
> (8:839)

This is a general distinction, but Mill is right to think it important for the analysis of free action. It can be applied to motives; an action caused by an irresistible motive is plainly not free. Without the distinction between resistible and irresistible causes, determinism turns into fatalism. We lose the sense of our moral freedom, which rests on the conviction that the motives on which we in fact acted were resistible. We fall into the idea that we have no power over our character; no ability to resist motives which we dislike or to

choose to act on those which we admire.

Now incompatibilists will concede that changes in our character may result from behaviour which is itself caused by the wish to change our character. But they will not concede that this is a true case of ‘self-formation’, because they think the wish to change our character is heteronomous: it comes from without. And they think that follows simply from the fact that the wish is determined, ultimately if not proximately, by external circumstances. So Mill has to show that while the wish must indeed be determined, that does not entail heteronomy. It can still be *my* wish.

He cannot answer simply by invoking the distinction between resistible and irresistible motives. For a motive might perfectly well not be irresistible, in that it could be blocked by other motives—yet still be heteronomous. Something has to be added if we are to move from the idea of my motives being resistible, in the sense that they could be trumped by conflicting motives, to the stronger idea that I have the power to resist motives. That idea is the idea of rationality: the ability to recognize and respond to reasons. I act freely if I could have resisted the motive on which I in fact acted *had there been good reason to do so*. A motive which impairs my moral freedom is one that cannot be defeated by a cogent reason for not acting on it. The differ-ence between a heteronomous agent, driven by conflicting motives which are capable of checking each other, and an autonomous agent who himself or herself resists the motive, lies in the fact that the latter responds to, and acts on, reasons.

Acting from good reason is still acting from a motive which is causally determining. What matters is how the motive determines: it must be so related to the facts, as they are believed to stand by the agent, as to constitute a good reason and it must also be the case that the agent acts on it *as* a reason. The same holds for the will to alter our character. It must indeed always be caused, and hence caused ultimately by circumstances we cannot help. But it still satisfies the conditions of moral freedom, if it results from our grasping that there is reason to change ourselves, and not, say, from indoctrination or obsession.

Moral freedom for Mill is the ability to act on good reasons, as autonomy is for Kant; though Mill does not highlight the point as Kant rightly does. And of course it is not, for Mill, transcendental. It is something I may have to a greater or less degree. I am more or less free overall, according to the degree to which I can bring my motives under scrutiny and act on the result of that scrutiny, I can *make* myself more free, by shaping my motives or at least by cultivating the strength of will to overcome them

> A person feels morally free who feels that his habits or his temptations are not his masters, but he theirs: who even in yielding to them knows that he could resist; that were he desirous of altogether throwing them off, there would not be required for that purpose a stronger desire than he knows himself to be capable of feeling…. we must feel that our wish, if not strong enough to alter our character, is strong enough to conquer our character when the two are brought into conflict in any particular case of conduct. And hence it is said with truth, that none but a person of confirmed virtue is completely free.
>
> (8:841)

The person of confirmed virtue is the person who can conquer desires, when there is

reason to do so, by a virtuous habit of willing. One must be careful not to assume that Mill, because he is an empiricist, is in the Humean tradition which holds reason to be a slave of the passions. We have already emphasized the difference between Hume's scepticism about both theoretical and practical reason, and the naturalistic epistemological stance taken in different ways by Reid and Mill. In the practical as in the theoretical case Mill is best understood not as denying the existence of categorical reasons, in the sceptical style of Hume, but as quietly naturalizing them. He takes it that talk of principles of theoretical and practical reason, and of our recognition of such principles, is justified. But the fact remains that he does not explain how it is justified, if nothing is *a priori*.

He does not dramatize the issue, as Kant's Critical philosophy does. And he does not confront the Critical questions: what is it for a reason to exist, what is it to grasp a reason, how can reason be efficacious? But, on his own showing these questions must be answered, in a fashion compatible with naturalism, if we are to make sense of ordinary categories—reasoning, inferring, deliberating, deciding—categories which involve thinking of agents and reasoners as free followers of rationally given norms. For while inference does seem to be a causal process it yet also appears to be something more than, or incommensurable with, a causal process. It seems to involve the *acausal* consciousness of a rule of reason. Precisely the same can be said for the rationalizing relation between motive or deliberation, and free action or choice.

NATURALIZED EPISTEMOLOGY

This Kantian argument, that naturalism cannot account for the rationality of experience, thought and action, was taken up by Mill's idealist successors in Britain, led by T.H.Green. They elevated Hume, who was held to have perceived it, over Mill, who was felt to have hidden his face from it, or been unable to grasp it. And certainly Mill offers no thoroughgoing examination of what, on his own philosophy, the status of fundamental norms of reason is—how they can have objective authority. He merely takes it that they do. The same applies to Reid. Like Reid, Mill assumes that any cognitive disposition which is 'ultimate', original or spontaneous thereby underpins an objective norm. We have seen this in his treatment of beliefs based on memory, as well as beliefs based on induction, and the same applies to his well-known derivation of what is desirable from what is desired 'in theory and in practice'. The similarity between Reid and Mill, on this fundamental point of naturalistic epistemological method—*the appeal to spontaneous dispositions which survive critical reflection*—is easy to miss. It is obscured by the undeniably important disagreement between them in what they actually place on their respective lists of fundamental principles, as also by the intrusion of the controversy between innatist and associationist psychology. But terms like 'ultimate', 'spontaneous', 'natural', etc. need not mean 'innate'—one must not confuse a phenomenon which is important for epistemological method—that of finding a principle naturally obvious—with a particular psychological explanation of its origin.

The divergence between Hume's sceptical naturalism, together with its Kantian and idealist sequels, and the naturalistic epistemology taken for granted by Reid, Mill and

others became a great divide in nineteenth-century philosophy. The most influential philosophers in the heyday of the analytic movement in the twentieth century stand also in the Critical rather than the naturalistic epistemological tradition. More recently, however, that has changed, largely through the influence of Quine. 'Naturalized epistemology' is once more influential. The questions concerning it remain the same. Today, as in Mill's time, one can ask whether there *is* any route open to the naturalist, between Humean scepticism and Kantian idealism.

If there is, it requires a sharper distinction than Mill, or indeed Quine, makes between norms and facts. Mill argued soundly from the naturalistic premiss, that no *factual* statement can be *a priori*. But the same is not true of *normative* statements. For *all* that grounds the objectivity of norms is reflective equilibrium and convergence—as indeed Mill's epistemological method implies. Having recognized this crucial point, one may innocently concede that statements about fundamental norms are—in a way Mill himself could have accepted, that is, a way which requires no transcendental or platonic mystery—*a priori*. Norms constitute the concepts which order our thought. Rationality, grasp of concepts, consists in sensitivity to them; it cannot therefore belong in the realm of the factual, any more than the norms themselves do. If this conception of concept and meaning can be made out, we can endorse Mill's naturalistic view of man.

CHAPTER 5
Sidgwick

C.A.J.Coady

Unlike John Stuart Mill or Jeremy Bentham, Henry Sidgwick's is hardly a household name in intellectual circles beyond the world of professional philosophy. His standing amongst many contemporary moral philosophers as possibly the greatest nineteenth-century writer on ethics would come as a shock to such householders, as would C.D. Broad's estimate of his book *The Methods of Ethics* as 'one of the English philosophical classics' and 'on the whole the best treatise on moral theory that has ever been written' ([5.15], 143). This high reputation could indeed be disputed, but it is not at all idiosyncratic. It is a reputation that has grown since his own time, and is probably at its peak today, but Sidgwick's intellectual power impressed many of his contemporaries, and immediate successors, as well. 'Pure, white light' was one description offered of his intellectual presence ([5.13], 181), and the adjective 'pure' tells as much about the moral intensity with which he applied his mind to the problems that exercised him as the word 'light' testifies to the clarifying power of his intelligence.

Sidgwick was a typical Victorian in many respects, and, in fact, his life paralleled that of the woman to whom the era owed its name. He was born in the north of England at Skipton on 31 May 1838, less than twelve months after Queen Victoria assumed the throne and he died on 28 August 1900, preceding his monarch by about six months. He was the son of an Anglican clergyman who was the principal of a grammar school in Skipton. His father died when he was three, and a strong influence upon his early life was his second cousin, E.W. Benson, a man who was later to be Archbishop of Canterbury. Benson lived with the Sidgwick family for some years, and eventually (in 1859) married Sidgwick's sister. Benson persuaded Sidgwick's mother to send the boy to Rugby school (where he was himself to be, shortly afterwards, a master) even though Sidgwick's father had been against a public school education for his children. Benson argued that the public schools, and especially Rugby, under the influence of Arnold, no longer had the poor 'moral tone' that Sidgwick senior had feared. Henry Sidgwick later recalled that Benson was 'a great believer in the close and minute study of language that was in his time specially characteristic of Cambridge scholarship' ([5.12], 149) and it is plausible to see this influence at work in Sidgwick's later philosophical writings, though the close attention is not only to language but to the detail of concept and theory. Benson's influence waned after Sidgwick went up to Trinity College, Cambridge in October, 1855. For the first half of his under-graduate career, Sidgwick 'had no other ideal than to be a scholar as like him as possible', but other influences then brought him to doubt many of the moral and, especially, religious certainties that sustained his cousin. These influences included at the global level the writings of Mill, Comte, Spencer, Strauss, Renan, Matthew Arnold, George Eliot and Darwin, and more locally the intense debates that

went on amongst the clever young men in the society known as ‘the Apostles’, which he joined in his second year. Sidgwick described his joining the Apostles as having ‘more effect on my intellectual life than any one thing that happened to me afterwards’. He described the spirit of the group as that of ‘the pursuit of truth with absolute devotion and unreserve by a group of intimate friends’ ([5.30], 134).

THE RELIGIOUS BACKGROUND

Victorian England has been faulted for many things, but moral frivolity is not one of them. In spite of a good deal of hypocrisy about public manners, it was an age that was, in one way or another, obsessed with morality. The leading intellects of the time were particularly concerned with the nature and role of morality in a world in which religion had become problematical. For continental thinkers, like Nietzsche, the crisis in Christianity meant a crisis in morality, but for so many English (indeed British) intellectuals, religious doubts seemed an occasion for consolidating morality, for making it more, not less, firm and central to life. There is a reported comment of George Eliot that puts the matter succinctly. Asked how morality could subsist in the absence of religious faith, she replied that God was ‘inconceivable’, immortality was ‘unbelievable’, but duty none the less remained ‘peremptory and absolute’ ([5.20], 21). In many ways, Sidgwick’s philosophical career could be seen as devoted to the securing of this central position for morality by providing it with the requisite intellectual foundations, which he believed to be available within the intellectual tradition of utilitarianism. Certainly he was concerned to maintain the ‘peremptory’ or demanding power of moral claims over our reasoning on practical matters though he may well have been uncomfortable with Eliot’s reference to absolute duty. Under the influence of John Stuart Mill, and Mill’s interpretation of Comte, he saw this project as part of a scientific endeavour to bring about a comprehensive reform of social life. He understood that he had set himself no easy task and the personal and intellectual honesty that were amongst his most notable attributes would not allow him to disguise this fact from himself or his readers. As we shall see, this strong and confident commitment to honesty and to reason had certain ironic and sad consequences for his final philosophical conclusions. It also created a personal crisis with regard to his Fellowship at Trinity which he felt obliged to resign in 1869, after ten years as a Fellow, because it required a subscription to the 39 Articles of the Church of England, and to these he could no longer in honesty commit himself. This did not prove vocationally disastrous because the College then appointed him to a position that did not require subscription and when the law about subscription was eventually changed he was reappointed a Fellow.

Sidgwick’s honesty, conjoined with his commitment to an ideal of ‘strict scientific impartiality’ ([5.12], 250), led him not only to a persistent scrutiny of his own religious views and those prevailing in the community but to certain general doubts about Christianity that, whilst being characteristic of the time in many respects, were also distinctively his own. These in turn enlivened his interest in the relation of religion and morality and in the need to establish what would now be called ‘the autonomy of ethics’, but they also led him to suspect easy attempts to disentangle morals and religion, and to

an uncomfortable resolution of the original problem.

It would be a mistake to think of Sidgwick as dismissive of the moral and cognitive claims of Christianity or religion, in the fashion of twentieth-century logical positivists, for example, or in the casual fashion of some of his contemporaries. He was persistently interested in a scientific approach to theology, an interest that extended to the vigorous promotion of the work of the Society for Psychical Research, of which he was the first President. He was also as critical of the confident excesses of those who shared his 'scientific' ideal as he was of more conservative thinkers. This can be seen in his comment on rereading Comte and Spencer: 'Have been reading Comte and Spencer, with all my old admiration for their intellectual force and industry and more than my old amazement at their fatuous self-confidence. It does not seem to me that either of them knows what self-criticism means' ([5.30], 421). Sidgwick could not share this self-confidence, partly because of his highly developed critical sense, and partly because of his sense of the deep complexity, even mysteriousness, of the world we live in. In this connection, he quotes Bagehot approvingly: 'Undeniably, this is an odd world, whether it should have been so or no; and all our speculations upon it should begin with some admission of its strangeness and singularity' ([5.30], 395).

Sidgwick never lost his sense of the central importance of religion in human life though he found it difficult to give an account of what that importance amounted to and what its intellectual credentials could be. The gap he detected between the demands of 'scientific' reason and the requirements of faith made him at times sympathetic to the claims of Roman Catholicism. His early mentor, Benson, had struggled against an attraction to Rome and the figure of Cardinal Newman apparently aroused 'a mixture of alarm and fascination' in Benson ([5.21], 3). Sidgwick's correspondence with Cardinal Newman's nephew, J.R. Mozley, is instructive on this and on his complex, and somewhat convoluted, attitude to Christianity and theism. Written in January 1891, the letters express an admiration for Newman's individuality of thought and expression and the fusion of both, but show a certain distaste for Newman's mode of reasoning which Sidgwick thinks to be somewhat 'feminine, in the old traditional sense'. Sidgwick seems to mean that Newman's 'conclusions have always been primarily influenced by his emotions, and only secondarily by the workings of his subtle and ingenious intellect' ([5.30], 507). Leaving aside this dubious, if hoarily traditional, account of feminine thinking, we may note the way that Sidgwick here makes a sharp separation of reason and emotion, and goes on, in a subsequent letter, to attach the value of religion and specifically Christianity to its emotional appeal, particularly its appeal to a certain attitude of optimism that he regards as 'an indispensable creed—not for every one, but for progressive humanity as a whole'. He thinks that no form of optimism has an adequate rational basis, and so cannot himself endorse it since he 'has taken service with Reason' ([5.30], 508). It is tempting to see in Sidgwick's attitude to religion and Christianity another sign of the tension between reason and utility that emerges in his writings on ethics. This is particularly striking in his discussion of the relations between common-sense morality and utilitarianism and in what I discuss below as 'Sidgwick's paradox'. Just as it may be for the best from the point of view of rational utility that the majority continue to practise ordinary morality as if it were self-sufficiently justified and be kept ignorant of the truth of utilitarianism, so it may be practically desirable that

ordinary mortals should adhere to religion without the disturbance of knowing their commitments to be irrational. But more of this later.

PERSONAL CHARACTER AND VIEW OF PHILOSOPHY

Sidgwick was not a man for disciples. Indeed there was a striking contrast between attendances at his Cambridge lectures and those of his Oxford counterpart, the idealist liberal philosopher T.H.Green, which is not altogether explained by the considerable differences between the place of philosophy in the curricula of the two universities. The economist Alfred Marshall had clashed with Sidgwick in 1884 over what seemed to him the latter's 'mania for over-regulation' and had then written Sidgwick a letter claiming that Sidgwick's career had been spoiled by involvement in administration and his devotion to teaching 'a wretched handful of undergraduates' what they needed to know for the Moral Sciences Tripos exams. He compared Sidgwick's intellectual impact unfavourably with T.H.Green's at Oxford: where Sidgwick's classes were attended by a handful of undergraduates taking down what they regarded as useful for examinations, Green's were attended by 'a hundred men—half of them B.A.'s—ignoring examinations, …to hang on the lips of the man who was sincerely anxious to teach them the truth about the universe and human life' ([5.30], 394).

Characteristically, Sidgwick was not offended, but took the opportunity to reflect on what he thought accurate in the criticisms. His reflections help us to locate his view of philosophy and of the intellectual life against some prevailing fashions, and to see where they compare with twentieth-century developments. Sidgwick did not envy Green his audiences because he thought them purchased at a price he was not prepared to pay, namely, the presentation of 'incomplete solutions of the universe…as complete and satisfying' ([5.30], 395).[1] His intellectual temperament was inclined to the admission of uncertainty and the patient dissection of problems; he was ill at ease with declamation and heady simplifications. This makes his work congenial to certain strands in modern analytical philosophy, as does his thoroughgoing professionalism, and his emphatic, though qualified, respect for common sense. These things set him apart from those of his contemporaries (like Green) who were enamoured of Hegel. It is interesting that T.H. Green's moral philosophy is today virtually unread, while Sidgwick is probably more influential than ever.

It should not be assumed, however, that Sidgwick thought of philosophy as a purely piecemeal activity, as a set of skills with no particular output other than the therapeutic ('showing the fly the way out of the fly-bottle' in Wittgenstein's phrase). He viewed philosophy as an attempt at systematic understanding of the world, though he was conscious of the inconclusiveness of many of its achievements, and aware that one of its persistent virtues was the turning of elusive philosophical material into more manageable scientific problems. He would have recognised the truth in J.L.Austin's picture of philosophy as a 'seminal and tumultuous' central sun from time to time throwing off some portion of itself to 'take station as a science, a planet, cool and well regulated, progressing steadily towards a distant final state' ([5.11], 180), though Austin's image tends to obscure the facts that there are great differences between the planetary sciences

with respect to 'cool and well regulated' progress, and, more importantly, that there remain hot and turbulent philosophical aspects to even the most 'well regulated' of them.

Sidgwick's view of philosophy is spelled out in his posthumously published lectures called *Philosophy: its Scope and Relations*. In this book he tries to distinguish philosophy from other disciplines especially the physical sciences, history and sociology. This he attempts to do partly by insisting on the role of philosophy as providing a systematic overview of reality, drawing upon and interpreting the insights of the particular sciences. It is only by aiming at this traditional goal, he thinks, that philosophy can fulfil its 'germinal function' of creating new sciences. He is also critical of certain developments within the special sciences, some of which are as common (and as dubious) today as they were in Sidgwick's day. His criticisms of the sceptical tendencies of some historical and sociological writings, for instance, illustrate some of the ways in which the special sciences can harbour philosophical confusions. Sidgwick emphasizes the 'contradictory state of mind' of the theorist whose most 'fundamental beliefs in ethics, politics, theology, philosophy…drop from him' in the face of acquired historical or prehistorical beliefs to which 'he clings with a passionate conviction which is in singular contrast to the slenderness of the evidence that it is possible to adduce in their support' ([5.8], 166). In the course of the book, he also makes certain important distinctions, which we cannot here pursue fully, within philosophy itself. The most original and interesting claims made by Sidgwick concern the distinction within philosophy between metaphysics and non-metaphysical philosophy. This distinction is not intended as a total rejection, or even a disparagement of metaphysics. He explicitly rejects the idea put forward by 'transcendentalists' that metaphysical speculations such as those about whether the world had a beginning in time are merely 'futile' (or in the later jargon of the logical positivists, 'meaningless') though he agrees that they are distinctive in being beyond empirical verification. He thinks it obvious that such claims must be treated 'realistically' (as we would now say) since they are palpably true or false whether we can determine the matter or not.

On the other hand, it is clear that he thinks some metaphysical claims less defensible than others, and his tone is typical of the commonsensical and analytical tradition of British philosophy, as, for instance, in his comments on Hegel's philosophical account of the tides. Here is Hegel as cited by Sidgwick: 'the moon is the waterless crystal which seeks to complete itself by means of our sea, to quench the thirst of its arid rigidity, and therefore produces ebb and flow' ([5.8], 89). Here is Sidgwick's comment: 'Now I do not propose to discuss the truth of this remarkable contribution to the theory of tides. What I wish to point out is that it appears to be clearly incapable of empirical verification, direct or indirect. The alleged effort of the moon to complete itself and quench its thirst has no connection whatever with any part of the system of laws by which physical science explains the empirical facts of terrestrial and celestial motions' ([5.8], 89). The interest of this passage lies not only in its anticipation of later analytical, pragmatist and logical positivist attitudes to the windy nonsensicalities of Hegelian metaphysics, but in its ironic dryness of tone. Compare William James, writing in 1908, in more direct terms:

> But if Hegel's central thought is easy to catch, his abominable habits of speech make his applications of it to details exceedingly difficult to follow. His passion

> for the slipshod in the way of sentences, his unprincipled playing fast and loose with terms; his dreadful vocabulary, calling what completes a thing its 'negation', for example; his systematic refusal to let you know whether he is talking logic or physics or psychology, his whole deliberately adopted policy of ambiguity or vagueness, in short: all these things make his present-day readers wish to tear their hair—or his—out in desperation. Like Byron's corsair, he has left a name 'to other times, linked with one virtue and a thousand crimes'.
>
> ([5.22], 513).

Sidgwick would probably have applauded the sentiments, though he could never have brought himself to use so abusive a tone.

Sidgwick wrote extensively in a variety of fields from metaphysics to political economy, and I shall later look briefly at some of these other areas. His historical perspective, learning and broad intellectual sympathies are evident in his *Outlines of the History of Ethics for English Readers*. This began life as a long entry on 'Ethics' for the ninth edition of the *Encyclopaedia Britannica* and was produced as a book in 1886. In spite of its modest title and relatively modest length, it is an absorbing piece of philosophical and intellectual history, and throws light upon Sidgwick's own work in moral philosophy. None the less, it is in ethics itself that his claim to fame securely rests, so we must turn to his masterwork, *The Methods of Ethics,* first published in 1874 and revised extensively throughout six editions. As is customary, I shall treat the final, and posthumous, seventh edition (which is basic-ally the sixth with a few minor editorial amendments) as definitive of his outlook, though there is much in the earlier editions that is instructive for a fully balanced view of the work. The basic aim of the book is the examination of three distinctive methods of approaching ethics—the intuitional, the utilitarian and the egoistic. Sidgwick professes not to be advancing an argument for the best method, but it is apparent that he regards both utilitarianism and egoism as more suited to the task of providing a rational or scientific basis for morality than any traditional form of intuitionism, though, as we shall see, his version of utilitarianism itself contains a strong intuitional dose.

COMMON SENSE, UTILITY, AND INTUITION

It is impossible here to summarize further or comment closely upon so large and dense a work, so I shall instead examine in some detail three central philosophical claims of Sidgwick's that are prominent in it. I have chosen them because they are distinctive of his outlook, arise from the intellectual debate of the time and yet remain important for contemporary moral philosophy. All three involve deep tensions, even conflicts, in moral theorizing, two of which Sidgwick thought he had solved but one of which he confessed himself defeated by. The first concerns the relation between utilitarianism and intuitionism; the second concerns what has been called the publicity principle; and the third concerns the clash between the demands of self-interest and morality.

Sidgwick was a convinced utilitarian but he was not a particularly reformist, and certainly not an iconoclastic, utilitarian. He was inclined to see utilitarianism not as

vanquishing other outlooks but as accommodating and explaining what was best in them. Up to a point, he is a strong defender of common sense, and part of the project in *The Methods of Ethics* is to reconcile utilitarianism with what he called common-sense morality. This latter he defined as 'a collection of [such] general rules, as to the validity of which there would be apparent agreement at least among moral persons of our own age and civilisation, and which would cover with approximate completeness the whole of human conduct'. Imposed as a code by the public opinion of a particular community, this would count as that community's positive morality, but 'when regarded as a body of moral truth, warranted to be such by the *consensus* of mankind,—or at least of that portion of mankind which combines adequate intellectual enlightenment with a serious concern for morality—it is more significantly termed the morality of Common Sense' ([5.5], 215). Sidgwick was impressed with the broad adequacy of common-sense morality, though he thought that from an ideal point of view there were certain significant imperfections in it. None the less, he thought that when we reflected on the demands of common-sense morality we would see that various inconsistencies and contradictions within it were eliminable by recourse to the principle of utility whilst, at the same time, the principle made the appeal of the common-sense requirements intelligible and rationally defensible. As he says in the Preface to the sixth edition of *The Methods of Ethics*, 'the reflection on Common Sense Morality which I had gone through, had continually brought home to me its character as a system of rules tending to the promotion of general happiness' ([5.5], xx). Consequently, he asserts that 'The utilitarian must repudiate altogether that temper of rebellion against the established morality, as something purely external and conventional, into which the reflective mind is always apt to fall when it is first convinced that the established rules are not intrinsically reasonable' ([5.5], 475).

He sees much of what he is doing in his writings on ethics as rescuing morality from the charge of irrationality. In this and other of his convictions he is a typical Victorian: unable to believe in traditional, orthodox Christianity and aware that its grip on ordinary people was loosening, he wanted morality detached from religion and made secure by appeal to reason alone. His hope was that the principle of utility would ground ordinary morality in intuitively obvious considerations of rationality. To this end he devotes a considerable part of *The Methods of Ethics* to the justification of traditional virtues on the grounds of their social utility. So, he argues that the various virtues can be grounded in the human goods they characteristically promote, and here he is self-consciously Aristotelian. (He tells us in an autobiographical statement that it was after rereading Aristotle that he decided to emulate his examination of the common morality of his own society.) Some governing moral theory was still needed however because, left entirely to itself, common-sense morality shows a tendency to internal conflict or inconsistency.[2]

Inasmuch as traditional intuitionists like Whewell believed that intuitionism was required to support common-sense morality since basic parts of it would otherwise be undermined by utilitarianism, then Sidgwick's arguments, if successful, seem to make the appeal to intuition against utility unnecessary. None the less, this appearance is, as Sidgwick recognized, somewhat deceptive since there remains the problem of the justification for appealing to the principle of utility in the first place, and here, Sidgwick admits, we must once more have recourse to intuition. Where the intuitionists appealed to

a plurality of intuitions to determine the various duties, virtues and prohibitions of traditional morality, Sidgwick claimed to be able to prove their validity on the basis of their contribution to human pleasure over pain, and almost on that basis alone. But this primal duty cannot itself be so recommended and, he concludes, its truth is known by intuition. So Sidgwick's utilitarianism has itself an intuitionist basis. Moreover, I used the qualification 'almost' above in reference to Sidgwick's basing morality upon the principle of utility, and the qualification is necessary because Sidgwick also recognizes as basic certain formal features of morality that are also revealed by intuition. These include for instance such 'axioms' as a principle of universalizability (as it would now be called) and a principle of temporal indifference which dictates that 'a smaller present good is not to be preferred to a greater future good' ([5.5], 381). If you are unhappy with the appeal to intuition, then Sidgwick can offer you a great reduction in its scope, but he cannot eliminate it altogether.

Sidgwick's compromise is not only distinctive but it poses a problem that continues to confront modern moral philosophers. Contemporary utilitarians are not attracted to Sidgwick's solution because, along with many other philosophers, they are uncomfortable with any appeal to intuition, at least if the intuition is taken to be a guarantee of truth or reliability. A fashionable response is to build one's utilitarianism upon a subjective base. This move is reinforced by the appeal to a distinction between meta-ethics and normative ethics. One's analysis of the moral vocabulary, particularly its fundamental but abstract categories, the so-called 'thin' concepts such as good, bad, right and wrong, are allowed to be specified as the individual chooses, constrained only by such formal limits as that they are terms of commendation or denunciation (or 'discommendation'). There is also a constraint of universalizability, but it is usually seen as delivered by logic or conceptual analysis of the moral vocabulary. The utilitarian has decided that the terms will be given normative content by recourse to the utilitarian principle, and, of course, hopes that this recommendation will have broad appeal. If not, there is nothing more to say to those who choose different material content for the moral terminology. One may try accusing them of irrationality, but since this term itself is essentially evaluative, the manoeuvre is easily dismissed by reminding the utilitarian of his or her own subjectivist meta-ethical commitments. Of course it may not be too clear why an appeal to intuition has anything over an appeal to feeling. If someone disagrees with you about a basic moral matter then the insistence that your view is a matter of rational intuition seems no more or less impressive than the assertion that you feel very strongly about the matter. I think that a good deal here turns upon what more can be said about intuition to contrast it with strong feeling and also what the disputants hold about other areas of human thought. If someone thinks (more or less with Hume) that, in the end, most human cognitive procedures turn upon proclivities of human psychology that are non-rational, then they will not be inclined to isolate ethics from natural or social science, or even from mathematics. If ethics is as much (or as little) a matter of rational understanding as natural science then in the face of this (rough) equality it may matter less whether we think of its foundations or principles in terms of powerful feeling, rational insight, or even some other resort, such as Wittgenstein's 'form of life'.

Another aspect of Sidgwick's treatment of common sense that deserves mention concerns the important allegation that common-sense morality is internally inconsistent,

and hence needs to be supplemented by a consistent, overarching theory. Since it is dubious that common sense is itself a theory of any sort, it is a little unclear what this could mean, and sometimes Sidgwick seems rather to mean that the theory of intuitionism is inconsistent. For the most part, however, his point seems merely to be that common-sense morality does not provide decision procedures to settle complex problems of what would once have been called casuistry. So, for instance, common-sense morality tells us that lying is wrong, but also tells us that we should do no harm to the innocent, and notoriously there can arise circumstances in which (on certain understandings of them) these duties appear to be in conflict. I am a UN 'peacekeeper' in the former Yugoslavia during the civil wars in the early 1990s that resulted from the demise of communism, and I have confidential information that a Bosnian female child is hiding nearby from a troop of Serbian irregulars, known to practise rape and murder against such as her, and they ask whether I know the where-abouts of any Bosnian civilians in the vicinity. If I tell the truth, she is doomed, if I refuse to answer, their suspicions will be dangerously aroused, but if I lie she has a chance of survival. (For Sidgwick's discussion of common sense and 'unveracity' see [5.5], 448–9.)

SIDGWICK'S PARADOX

The second claim concerns what I shall call 'Sidgwick's paradox' since he referred to it himself as paradoxical. The problem is a specific but very special case of the refinements of utilitarian theory required partly by the condition that it be sensitive to the data of common-sense morality but even more by the adaptation of the utilitarian principle itself to the requirements of human nature and circumstance. One such adaptation leads, for instance, to motive utilitarianism where the primary focus of the utility principle is on motives and other human dispositions that can themselves be argued to maximize utility. On a simple (perhaps simple-minded) act of utilitarian analysis it may be best for a group of discreet sadists to torture an orphan child to death in the privacy of their club cellar with no prospect of the victim's sufferings disturbing others or of word of it getting abroad. Yet this indirect version of utilitarianism could argue that the cultivation or further entrenchment of sadistic dispositions is bound to be productive of worse outcomes for society than could be warranted by the short-term gain in the utility of the group here directly affected by the act of torture. Now it seems to me unlikely that this sort of manoeuvre is, in general, going to succeed in showing that such acts are morally wrong, or, even if it did, in explaining *what* is wrong with them. (There is indeed an air of absurdity in the way the explanation takes us away from the specific wrong done to the child and focuses on some general harms that might be produced by the prevalence of such habits in the perpetrators and others.) None the less, I shall not pursue this debate here; I mention it only to illustrate the path taken by indirect forms of utilitarianism as a preliminary to discussing Sidgwick's paradox. The point to be noted is that the dictates of the utility principle, properly understood, are not always what they might at first blush seem. Certain deeds that do not seem to be utility-maximizing may none the less prove to be so if we think more subtly and widely about the matter, but Sidgwick's paradox, though it incorporates this simple reflection, takes us into far more turbulent waters.

The paradox can be briefly stated as the fact that the truth of the utility principle may require that almost no one accept it as true. If the utility principle is true then (almost) no one should believe it, and if it's not true then no one should believe it, so whatever its status no one (or almost no one) should believe it. Put in terms of rationality, the paradox tells us that the most rational way for lives to be conducted is by the utility principle, but this is only possible if (almost) no one conducts their lives by reference to the principle. This paradoxical outcome of the Sidgwick inquiry is the limit case, so to speak, of a general tendency within the utilitarian enterprise to require the existence of dependable moral rules and accompanying behaviour as a background to the occasional beneficial utilitarian violation of them. Given certain empirically plausible assumptions about human nature and the likely effects of making public the utilitarian basis of all morality, it will then quickly emerge, on utilitarian principles, that the rational necessity for violation is something that should not be generally known. If it were to be known then the broad commitment to morality for its own sake, on which wide conformity to moral norms seems in part to rest, might well be undermined, and the overall effect be disastrous from the utilitarian point of view.

Peter Singer, writing in the spirit of Sidgwick, gives as an example the case in which a professor gives a student a higher grade than his work merits 'on the grounds that the student is so depressed over his work that one more poor grade will lead him to abandon his studies altogether, whereas if he can pull out of his depression he will be capable of reaching a satisfactory standard' ([5.31], 166). Singer concludes that this may be the right action but, if so, it would be wrong for the professor to advocate publicly such behaviour because then 'the student would know that the higher grade was undeserved and—quite apart from encouraging other students to feign depression—the higher grade might cheer the student only if he believes that it is merited' ([5.31], 166). Leaving aside the professor's quandaries when the student continues cheerfully to submit inferior work that he now believes to be adequate, we may note that Singer quotes Sidgwick approvingly here as saying that 'the opinion that secrecy may render an action right which would not otherwise be so, should itself be kept comparatively secret' and he thinks it has an air of paradox to maintain that 'it would be right for an individual to do secretly what it is also right for the public code of ethics to condemn' ([5.31], 166). Singer consoles himself with the thought that the paradox does not belong to the secrecy doctrine itself but to the attempt to state it publicly which will be subversive of the public code that the same doctrine says must be supported. In a surprisingly ebullient fashion he goes on to acknowledge that his own public stating is a piece of wrong-doing, but perhaps the cheerful air with which he makes this confession of wickedness is sustained by the belief that only utilitarians will read the book. In any case, the furtive stance can hardly be quarantined to specific violations of public codes, as Singer seems here to show a tendency to believe. Sidgwick, at any rate, is clear that the general acceptance of utilitarianism as the rationale for morality by ordinary people might be a disaster in utilitarian terms. He is explicit that, granted the assumptions mentioned earlier, the truth of utilitarianism must be kept secret by the elite who have discovered it. So he says: 'And thus a Utilitarian may reasonably desire, on Utilitarian principles, that some of his conclusions should be rejected by mankind generally; or even that the vulgar should keep aloof from his system as a whole, in so far as the inevitable indefiniteness and complexity

of its calculations render it likely to lead to bad results in their hands' ([5.5], 490). In Derek Parfit's terminology, utilitarian theory would then be 'self-effacing' ([5.27], 40–3), at least for the vulgar. It would of course be different, according to Sidgwick, in what he calls 'an ideal community of enlightened utilitarians' ([5.5], 490), but he was realistic enough to see this prospect as remote from the real world.

So much for the genesis of the paradox, what about its status? One interesting fact about the puzzle is that it has an interesting formal affinity to a puzzle in epistemology. The traditional epistemologist is interested in whether and how it is rational to trust to the deliverances of our cognitive powers, such as perception, memory and so on. But it is often unclear whose rationality is here at stake. When some complex proof is provided of the rationality of relying upon the senses for knowledge, is the theorist's possession of the proof supposed to show that everyone is rational to trust their senses even if they have never encountered the proof and wouldn't (perhaps) understand it if they did? Or is only the theorist rational to trust the senses or memory?

Perhaps the best thing to say is that the theorist's justification (if correct) shows that the practice is rational but not that the practitioners are rational in following it. There are echoes here of the debates about internalist versus externalist justificatory analyses of knowledge. On an externalist account it is enough to show that the justificatory relation, be it causal relation, reliability connection or whatever, obtains between the practice and what it is supposed to deliver. By contrast, internalist theorists maintain that the putative knower cannot be said to know unless he or she at least has some grip on what the relation is, and perhaps why it justifies the relevant belief. As regards rationality, the externalist can rest content with the discovery that the practice is rationally grounded and the rest of us can get on with doing what we always have done. The internalist is likely to be more missionary about the matter since he or she must be worried by the thought that all the other practitioners are not behaving rationally in trusting their senses, memory or word of others. Their procedures can be rationally justified, but their ignorance of the justification suggests the disturbing thought that *they* are not rationally justified in using them. Yet although the externalist is likely to be less missionary, he or she will have no antipathy to the promulgation of his or her discovery. There is nothing in his or her position that demands that the discovery be withheld from the masses, and it would surely be surprising (to say the least) if this were so. For an externalist, the practitioners may not need an understanding of the rational basis of their cognitive practices in order to be acting rationally but such understanding could hardly make the practitioners' behaviour thereby less rational.

Interesting as this issue is, we have the sense that it doesn't matter a whole lot if the ordinary person has no access to the philosopher's proof, since the ordinary person doesn't usually raise the question of rationality here. From the point of view of the philosopher, it is enough that the rationality of the procedures can be demonstrated. The philosopher is, after all, the one worried about the justificatory question, and he or she, just as much as the ordinary person, has no practical doubts about the general viability of the perceptual and memory practices, nor any alternative to persisting with their use. This is the first point of contrast with morality. The contrast is not perhaps as vast as is often made out, but exists none the less. It is not so vast because ordinary people must use values; they (like the philosopher) must act for this reason or that, and so will not be

paralysed by the failure to have some general rationale for their ethical choices. Yet there remains a contrast, because our resort to values is not as constrained and automatic as our resort to perceptual and memory practices. As Sidgwick himself recognizes in the first chapter of his book, 'Men never ask, "Why should I believe what I see to be true?" but they frequently ask, "Why should I do what I see to be right?"' ([5.5], 5). In putting the question 'How should I live?' at the centre of ethics, Socrates rightly emphasizes that there are deeper level questions about the right way to conduct our lives that every person is free to raise and which present genuine options for action depending upon the answers given. Consequently, the interest of the philosopher's question about the rational justification of our moral practices is inevitably less specialist and confined than the otherwise parallel epistemological questions. When the theorist decides that the utility principle is what justifies the practices, then the answer can hardly be considered irrelevant or unimportant to the questions ordinary people are quite often drawn to ask.

ASSESSING THE PARADOX

None the less, they cannot be told, and we must ask whether this gnostic elitism is logically or morally suspect. Certainly, it violates what, since Kant, has been thought of as a basic requirement of a moral system, namely, the publicity principle. In the second appendix to *Perpetual Peace*, first published in 1795, Kant states this as follows: 'All actions affecting the rights of other human beings are wrong if their maxim is not compatible with being made public' ([5.24], 126). This would clearly rule out Singer's specific case, but also the esoteric secrecy of the utilitarian principle itself which seems to be a maxim for conduct in Kant's sense. If the publicity principle is a logical or conceptual condition for any moral system then this seems fatal to Sidgwickian utilitarianism, but it might be argued that the shoe is on the other foot, since the viability of Sidgwickian utilitarianism shows the publicity principle to be mistaken as such a condition. In any case, attractive as the publicity principle seems to be, there are certain 'local' counter-examples to it. For example, there are good reasons for allowing that the legal authorities should not even bring to prosecution certain cases that qualify as legally severe offences, such as mothers who kill their babies whilst in a state of extreme post-natal depression. But although this may be sound public policy, it may also be sound public policy not to make it public knowledge. Again, it may be good public policy in certain circumstances to deal secretly with terrorist groups, but bad policy to make it known that this is your policy. I am inclined to think that examples like these are acceptable only because they fall under more general maxims that can, and perhaps should, be publicly avowed. I will not try to spell these out here, but principles of mercy and avoidance of futility in punishments are relevant to the first example, and certain broad rules of conflict resolution to the second. What is harder to swallow is precisely what is at issue in the Sidgwick paradox, namely, that the basic principle underpinning the rationality of ethics must itself be kept secret.

One difficulty concerns membership in the elite, and here it is a matter of some astonishment that Sidgwick and other utilitarians seem so little concerned with the consequences of publishing their 'discovery' of the truth of utilitarianism. Sidgwick

seems to have lectured and published his views with no concern for their potentially disastrous consequences upon an audience that could hardly be presumed to be as all-wise, prescient and strong-willed as possession of the dangerous truth requires. But if the easy assumption that their audience will constitute 'an ideal community of enlightened utilitarians' is surprising, it only seems to reflect the hubris involved in the assumption that the theorist is personally worthy of the revelation. After all, capacity to achieve philosophical truth need not correlate with high moral development or the intellectual capacities for calculating consequences that the ideal utilitarian should have. There is a certain aptitude to Bernard Williams's characterization of the outlook as that of the colonial administrator ([5.35], 108–10).[3] The easy assumption by utilitarian theorists that they, and a few of their friends, are uniquely capable of the rationality that would be disastrous if employed by the *hoi polloi* is not so much, or not only, a piece of hubris but a requirement of the theory. After all, if we assume that the principle of utility is the truth that makes morality rational, but that it is a dictate of the principle that *no one* should base their actions upon it, then its supposed truth is entirely insignificant. As Williams has noted, we would then face the conclusion that if utilitarianism is true, then it is better that people should not believe in it, and if it is false it is better that people should not believe in it, so either way no one should believe in it ([5.34], 68). Consequently, the commitment to elitism is the only way to preserve any significant content for the claim that utilitarianism provides for the rationality of morality.

Another way of dramatizing the difficulty inherent in the paradox is to consider what happens to humble theorists who begin to suspect that they may not be members of the elite. If the theorist cannot be certain that he or she is worthy of the revelation, it may be for the best that they take steps to expunge it from their memory, if this is at all possible. Certainly, theorists will have considerable trouble making the distinction, in their own case, between utilitarianism as a theory of justification of the practice of morality, and utilitarianism as a theory of the correct motivation for right action. Once they have realized it provides the former, how can they avoid treating it as an answer, for them, to the latter, even where they have reason to think that this will be for the worst.

In any case, let us suppose that the theorist is personally worthy of the truth, and knows it. How (we might wonder) is he or she to prevent this truth becoming more widely known? One way would be to engage energetically in the refutation of utilitarianism, crusading against it in the cultural journals and the popular press, and advocating the truth of intuitionism. This Sidgwick notably failed to do. Indeed, his character seems to have been so significantly non-utilitarian that his commitments to honesty would have prevented this recourse. Donagan has argued plausibly that Sidgwick's resignation of his Fellowship at Trinity College over the religious test issue illustrates this aspect of his character and thought ([5.17], 459–60). As Sidgwick himself said at the time in correspondence on the matter after reviewing certain general arguments for and against resignation: 'After all, it is odd to be finding subtle reasons for an act of mere honesty: but I am reduced to that by the refusal of my friends to recognise it as such' ([5.30], 201). This fact is of more than biographical interest, because it shows that, for the theorist himself or herself, the split between motivational and justificatory outlooks is impossible to maintain, as is the related distinction of which Sidgwick, and later Smart and Singer, make so much between reasons for acting (on the one hand) and reasons for praising and

blaming (on the other). When the utilitarian claims that it may be right to do some act but also right to condemn it publicly, then we are entitled to ask what sort of attitude utilitarian agents can take towards their own commitment to such an act. They must stand ready to do such acts in spite of having cultivated a strong tendency to condemn them. The difficulties involved here are unwittingly displayed in one of Sidgwick's own comments. Noting that it may be expedient that divergent codes should exist within a society, Sidgwick writes that 'it may conduce most to the general happiness that *A* should do a certain act, and at the same time that *B, C, D* should blame it. The Utilitarian of course cannot really join in the disapproval, but he may think it expedient to leave it unshaken; and at the same time may think it right, if placed in the supposed circumstances, to do the act that is generally disapproved' ([5.5], 491). But the assertion that the utilitarian cannot join in the disapproval is simply wrong if it means that the utilitarian cannot publicly blame the act, though ready to do it himself. After all, that is the point of distinguishing reasons for acting from reasons for blaming. Sidgwick's lapse from the letter of consistency here is a testament to the moral integrity and psychological sanity he possessed but felt obliged by theory to ignore.

There is a related issue here that deserves some attention and it concerns the possible transition from a situation in which the vulgar are incapable of receiving the truth of utilitarianism to one which might qualify as inhabited by an ideal community of enlightened utilitarians. It is unclear in Sidgwick whether this is thought to be a real possibility or not, though several passages suggest that he thought it was. If so, then the set of attitudes involved in the paradox seem to make the transition impossible except by magic. Certainly it is hard to see how it could be effected by reasoning or education.

THE FINAL PUZZLE

The third puzzle might itself be called a paradox. It concerns a kind of contradiction that Sidgwick affects to find at the heart of ethics. He establishes to his own satisfaction that basic intuitions deliver the rational self-evidence of the fundamental utilitarian principle that he calls the Principle of Rational Benevolence. As we have seen, this enjoins us to 'aim at the happiness of other human beings generally', but for present purposes I do not want to challenge its utilitarian basis, since the problem Sidgwick poses is to some extent independent of his formulations. Let us just think of the principle as one that enjoins us to aim sometimes at the happiness of others, even where this course of action conflicts with the promotion of one's own narrowly conceived good. Although Sidgwick thinks that it is rational to act on this principle and to base one's ethic and life upon it, he cannot rid himself of the thought that it is *also* rational to base one's life and ethic upon the Principle of Egoism, which requires an agent to choose the course of action that will most promote his or her good (and for Sidgwick this means his or her pleasure). Yet Sidgwick plausibly believes that these two principles are in conflict; they are, in a sense, logically incompatible, but both, he thinks, are self-evidently true. Opinions will vary about how compelling the case is for either of these principles, and certainly the case for a benevolence or an egoism as demanding and far-reaching as Sidgwick intuits seems to me to be fairly weak. None the less there is a strong case for there being some altruistic

principle at the heart of ethics and this seems likely to be incompatible with any strong version of egoism, and egoism has a long history of appeal as a basic dictate of rationality. (Despite its popularity and longevity, there are, I suspect, serious difficulties in formulating and defending a version of egoism that is at once coherent and ethically challenging.) Supposing however there to be the clash between the egoist and altruistic principles, however refined in detail, then what of Sidgwick's enterprise? He himself sees it as threatened and sees no way of defusing the problem by recourse to the internal logic of the two positions. In so far as he has a solution it consists in the appeal to what he calls a postulate that is required to save the consistency of ethics as a basic department of human thought. This is the postulate of a benign God who reconciles duty and self-interest, or, more antiseptically, a benign Order to the universe in which the reconciliation is achieved.

Does this work? C.D.Broad objects that the two principles remain inconsistent regardless of the existence of God who cannot alter their self-evidence and hence 'something which appeared self-evident to Sidgwick must have been false'. Broad also points out that the postulate might comfort us by showing that it is a matter of 'practical indifference' which of the principles is false, but thinks that this gives us no 'adequate ground' for making the postulate ([5.15], 253).

There are at least two separate elements in the problem, and in Broad's objection, that need to be separated. Firstly, would the existence of a God with the usual attributes of the Christian theistic tradition, benevolently disposed towards human beings, solve the paradox? Secondly, if the answer is 'yes', is this fact sufficient to accept such a God's existence? On the first point, there is a level of understanding the problem at which the answer may well be 'yes', and at which level Broad seems to have missed the point. Call it level A. This is the level at which we may ask whether the actual maximization of an individual's good is always compatible with the maximization of the good of all; or, if there are problems with the concept of maximization here, whether optimizing the individual good is always compatible with optimizing the good of all. What Sidgwick has in mind here is that the sort of God in question will have so arranged the world that individual and communal well-being ultimately harmonize. If so, then there can be no actual clash between action that really promotes one's own good and action that really promotes the good of others. If people acted to achieve what was really their own good they would in fact be acting for what was really the good of others and vice versa. At this level, what happens to Sidgwick's self-evident principles is not that he is wrong about one of them but it doesn't matter which, but rather that they are both true, and possibly self-evident, and it is the appearance of a contradiction between them that is wrong.[4]

But this reconciliation leaves us with a problem about how to conduct our lives here and now that is reminiscent of the shifting relations between justification and motivation that plagued the discussion of the earlier paradox. For consider the agent who is persuaded of the reconciliation achieved at level A. She knows that acting from self-interest and from altruism are ultimately in harmony, but what is she to do now in a situation in which they appear to clash? At this phenomenological level (call it B) it would surely be wrong to leave her free to choose either course of action on the grounds of the perceived reconciliation at level A. If we say that she should rather choose self-interest, in the cheerful hope of the reconciliation offered by God, we have something

like Ayn Rand's picture of ethics, or, at a cruder level still, that of economic rationalism and the 'invisible hand'. If we urge the altruistic road, we have something closer to utilitarianism, but the problem is that neither road is mandated at the motivational level by the reconciliation at the justificatory level. The problem could be resolved if we had a revelation from God that utilitarianism was the way to go, or that common-sense morality embodied (ultimately) the path of reconciliation, but in the absence of this, the problem remains. (Butler, to whom Sidgwick is considerably indebted, seems to have thought that conscience constituted such a revelation.)

Finally, on the second point, Sidgwick does not argue that the Deistic postulate (or some postulate not involving a personal God that serves the same function) should be made because it is comforting, but rather that its viability depends upon certain very general considerations of fundamental epistemology. As he puts it:

> 'Those who hold that the edifice of physical science is really constructed of conclusions logically inferred from self-evident premises, may reasonably demand that any practical judgements claiming philosophic certainty should be based on an equally firm foundation. If on the other hand we find that in our supposed knowledge of the world of nature propositions are commonly taken to be universally true, which yet seem to rest on no other grounds than that we have a strong disposition to accept them, and that they are indispensable to the systematic coherence of our beliefs,—it will be more difficult to reject a similarly supported assumption in ethics, without opening the door to universal scepticism.
>
> ([5.5], 509).

Sidgwick's own employment of self-evidence and intuition, and his general picture of the attempt to produce a 'science of ethics', clearly incline him to the first outlook, but he is well aware of the attractions of the second, and its relevance to the problem he confronts. If what we mean by the rationality of our fundamental cognitive and scientific practices gets back to a deep tendency to accept that they are coherent even where there is no further argument to accept them, then the same grace should be extended to ethics. It is even possible, to return briefly to our earlier reflections on Sidgwick's attitude to religion, that a similar grace could be extended to God.[5]

APPLIED ETHICS

Sidgwick's work in economics is now of principally historical interest, but his political philosophy is more important, though much less influential than his ethics. His views on immigration policy, liberalism and war have all been referred to in recent writings. It is also significant that, although he stands at the beginning of the academic professionalization of philosophy that has been extravagantly praised and equally as extravagantly bewailed in recent years, he saw this as no impediment to involvement, as a philosopher, in issues of broad public concern. The picture of the analytical philosopher as professionally unconcerned with public life and its intellectual problems, and as

having nothing distinctive to add to the public debate, was not his. Here he was at odds (as on many other things) with his contemporary F.H.Bradley who proclaimed in 'My Station and its Duties' in 1876 that 'there cannot be a moral philosophy which will tell us what in particular we are to do, and…it is not the business of philosophy to do so. All philosophy has to do is "to understand what is", and moral philosophy has to understand morals which exist, not to make them or give directions for making them' ([5.14], 193). Sidgwick's view was more nuanced, and would have set him apart from a powerful mood within analytical ethics that really began with G.E.Moore—who once claimed that 'The direct object of Ethics is knowledge and not practice' ([5.25], 20)—and prevailed until the 1970s. Quite apart from his interest in political philosophy and his broad commitment to utilitarianism, he was a member of the Ethical Societies in London and Cambridge which were groups, including academics, professional people and figures in public life, that met regularly to discuss papers read by members on matters of public import. The British groups were modelled on the Societies for Ethical Culture that had been earlier established in the USA and led to the founding of the philosophy journal now known as *Ethics*.

Sidgwick's contributions to these discussions were very much in the spirit of what would now be called 'applied philosophy', and a number of his addresses were collected and published in 1898 (with a second edition in 1909) in the book *Practical Ethics*. In this, Sidgwick discusses specific issues of public concern from a philosophical perspective and also ponders the general question of the appropriate role for philosophy in the discussion of such matters. This is a question that considerably exercises contemporary philosophers and non-philosophers, both those who favour the involvement of philosophers in 'practical ethics' and those who oppose it. Sidgwick's discussion of it is characteristically acute and careful. He states the problem as that of determining 'the proper lines and limits of ethical discussion, having a distinctly practical aim, and carried on among a miscellaneous group of educated persons, who do not belong exclusively to any one religious sect or philosophical school, and possibly may not have gone through any systematic study of philosophy' ([5.9], 5). His suggestion is that such inquiries should avoid attempts to get 'agreement on the first principles of duty or the Summum Bonum' ([5.9], 4), and rather strive to clarify and elucidate that fairly extensive agreement in the details of morality we find already existing 'both among thoughtful persons who profoundly disagree on first principles, and among plain men who do not seriously trouble themselves about first principles' ([5.9], 6). Sidgwick believed that this technique could 'get beyond the platitudes of copybook morality to results which may be really of use in the solution of practical questions' ([5.9], 8). He thought that would lead to the development and refinement of 'middle axioms' of moral thought ([5.9], 8), and, though Sidgwick does not acknowledge that this reference is to a technical term used by late medieval theologians in expounding the nature of the art of casuistry, he later explicitly compares the activity of 'practical ethics' to the work of casuistry, understood as 'the systematic discussion…of difficult and doubtful cases of morals' ([5.9], 17). This comparison is a striking anticipation of very recent writings on the nature of applied ethics, and Sidgwick goes on to offer a partial defence of the older theological casuists against their seventeenth-century detractors that itself anticipates the work of Jonson and Toulmin one hundred years later. Curiously enough, Jonson and Toulmin, in apparent

ignorance of *Practical Ethics*, treat Sidgwick as an outright enemy of casuistry, and the source of many of the difficulties that modern moral philosophers have had in coming to grips with the realities of practical ethics ([5.23], 279–81).

It may of course be that there is some tension between Sidgwick's later views and his enterprise in *The Methods of Ethics*, so it is worth pausing here to wonder at the relevance of Sidgwick's sane comments on the viability of practical ethics to his earlier critique of the inconsistency of common-sense morality. Sidgwick, as we saw, argued in *The Methods of Ethics* that common-sense morality needed somehow to be supplemented by utilitarianism in order to overcome its inconsistencies, at least in the sense that a decision procedure was needed to adjudicate between the differing dictates of ordinary virtues or rules. Yet, it seems that we need no such ultimate appeal for the complex problems confronting practical ethics since casuistic analysis and, at most, reasoned appeal to 'middle axioms' can do the trick. This suggests that the drive in Sidgwick's pure ethics towards a sort of foundationist rationality may well be generated by a non-existent problem, or by the conflating of several different problems. He was right to insist that moral thought and action cannot always rest content with surface instincts and intuitions, whether individual or communal, but the work of reason, though always implicated to some degree in generality and principle, may here be justifiably more piecemeal, pluralistic and circumstantial than the utilitarian model requires. If so, we may also have reason to review the sharp separation of reason and emotion to which the model (and, as we saw, Sidgwick personally) is committed. It is indeed arguable that this might require some adjustment in our understanding of philosophy itself, particularly in relation to the activities of the practical intellect, and here the tension in Sidgwick's thought points towards an area of unresolved current debate.[6]

Several of the other more specific essays in *Practical Ethics* discuss topics that have also recently been subjects of passionate debate amongst contemporary philosophers with an interest in applied philosophy or political ethics. There is an essay on the morality of war ('The Morality of Strife'), on dirty hands in politics ('Public Morality') and on philosophy, science and culture ('The Pursuit of Culture'). Two apparently more remote papers, 'The Ethics of Religious Conformity' and 'Clerical Veracity', in fact canvass issues of professional ethics that are much with us today, and the essay on 'Luxury' is interestingly related to later debates about the role of elites. The final chapter on 'Unreasonable Action' is an excellent discussion in the philosophy of moral psychology of the age-old but currently fashionable topic of akrasia. It is unfortunate that these essays are not better known (*Practical Ethics* has not been reprinted since the early twentieth century) because they are all thought-provoking, and the essays on 'Public Morality', 'The Morality of Strife' and 'Unreasonable Action' are outstandingly good.

In addition to this sort of involvement in public issues, Sidgwick was also energetic in the practical pursuit of various public causes, most notably the higher education of women. He was instrumental in opening up university education at Cambridge for women, and was not only one of the founders of Newnham College (the first women's college established in Cambridge) but contributed a good deal of money to its foundation. He was also heavily involved in university affairs, and served on several government commissions of inquiry.

G.E.Moore attended Sidgwick's lectures and apparently thought them dull, and

Sidgwick, on hearing that Moore was producing a book on ethics, said he thought it would be acute, but expressed the view that Moore's '*acumen*-—which is remarkable to a degree—is in excess of his *insight*' ([5.28], 17).[7] Sidgwick was sharp enough himself, however much his patient capacity to explore every aspect of a question could often inhibit a sparkling style, but above all he craved insight. The aim of his intellectual endeavours had been, he wrote two weeks before his death, 'the solution, or contribution to the solution, of the deepest problems of human life' ([5.30], 33–4). He was disappointed that he had not done more to fulfil it, but his own evaluation of his achievements has proved notably less enthusiastic than posterity's.

NOTES

My thanks to Andrew Alexandra, Will Barrett, Bruce Langtry, Kim Lycos, Mary McCloskey, and Thomas Pogge for helpful discussion of Sidgwick's views (though my gratitude does not always extend to following their suggestions), and to Will Barrett for research assistance with references and bibliography.

1 The quote is actually from Bagehot, but adapted by Sidgwick to express his view of Green's work.

2 The discussion of this issue is bedevilled by a tendency Sidgwick displays to conflate common-sense morality and the philosophical theory of intuitionism; indeed, in his Index to the *Methods of Ethics* the two are explicitly identified. It is better to treat common-sense morality as providing the pre-theoretical data for a theory of morality in the fashion recommended by Rawls and usually followed by Sidgwick. The moral theory should then accommodate the pretheoretical 'facts', mostly by way of explanatory agreement with them, but sometimes by way of new recommendations that are accompanied by an explaining away of the recalcitrant data.

3 In fact, the influence of the English utilitarians upon colonial policy seems to have been more in the direction of Benthamite and openly interventionist policies of change in local practices, customs and laws. It was not marked by Sidgwick's attitude of cautious, if elitist, conservatism towards existing moral attitudes. For an interesting discussion see Stokes [5.32].

4 Derek Parfit thinks ([5.27], 462) that the problem is real, but can be solved in piecemeal fashion if we recognize that in addition to egoism and benevolence there is a third decision principle that may be used to tip the scales, namely, the principle yielded by what he calls the present-aim theory. Roughly, if it is equally rational to follow the dictates of self-interest and of benevolence, but they don't coincide, and we have a strong present desire to follow either benevolence or self-interest, then we have good reason to follow whichever of the two our coolly considered present aims (desires etc.) favour. The success of this tactic depends on what one thinks of the present-aim theory as a theory of rational action and on how it is distinguished from its competitors, but we cannot enter into this complex question here.

5 C.D.Broad thought that something like this was probably Sidgwick's final position with respect to religious belief ([5.16], 109–10). In support he quotes a letter Sidgwick wrote in 1880 to an old friend, Major Carey, in which after asking, 'What guarantee have you for the fundamental beliefs of science except that they are consistent and harmonious with other beliefs that we find ourselves naturally impelled to hold?' he adds, 'This is precisely the relation which I find to exist between Theism and the whole system of my moral beliefs. Duty

to me is as real as the physical world, though not apprehended in the same way; but all my apparent knowledge of duty falls into chaos if my belief in the moral government of the world is conceived to be overthrown' (109).

6 When discussing the nature of philosophy Sidgwick seems unaware of any such tension and keeps very much to the high ground of abstract rationality. So he writes, in *Philosophy, its Scope and Relations*, 'It is commonly felt that an attempt to work out a complete system of duties would inevitably lead us out of Philosophy into Casuistry: and whether Casuistry is a good or a bad thing, it is certainly not Philosophy' ([5.8], 25–6). In this context, he regards moral philosophy as 'primarily concerned with the general principles and methods of moral reasoning, and only with the details of conduct so far as the discussion of them affords instructive examples of general principles and method' ([5.8], 25). Contemporary philosophers are much less confident about this sort of division in every area of thought. For some contemporary views about the role of philosophy in ethics that are, in different ways, sceptical about the high ground see: Walzer [5.33], Williams [5.35], and Jonson and Toulmin [5.23]. For views still seeking a central role for philosophical reason see Donagan [5.18], Gewirth [5.19] and O'Neill [5.26],

7 Schneewind's book [5.28] is a masterly treatment of the background to Sidgwick's ethical thought, and also gives a careful and sympathetic unravelling of what he understands Sidgwick to be doing in *The Methods of Ethics*.

CHAPTER 6
Comte and positivism

Robert Brown

COMTE'S AIMS

The chief aim of all of Auguste Comte's publications, and the constant mission of his entire working life, was the improvement of human character through the perfecting of human society. He was convinced that the scientific knowledge available in his own lifetime—the first half of the nineteenth century—was rapidly making possible, and in a sense inevitable, the creation of the most suitable society for the 'social regeneration of Western Europe'. Born in Montpellier in 1798, Comte was both literally and intellectually a child of the eighteenth century who became an adult during the Napoleonic aftermath of the French Revolution. In searching for social salvation by means of the application of science to political and economic questions, Comte was a perfectibilist of a sort that he helped to make typical of his period. The set of beliefs about society that perfectibilists of his kind had inherited from the eighteenth century have been well summarized by John Passmore in *The Perfectibility of Man:*

> Man had until that time been a mere child in respect of knowledge and, in consequence, of virtue; he was now at last in a position, as a result of the development of science, to determine how human nature develops and what is the best thing for human beings to do; this new knowledge could be expressed in a form in which all men would find it intelligible; once they knew what it is best to do, men would act accordingly and so would constantly improve their moral, political and physical condition. Provided only, then, that 'sinister interests' did not prevent the communication of knowledge, the development of science was bound to carry with it the constant improvement of the human condition, to a degree which would be, like the growth of science itself, unlimited.
>
> ([6.50], 208)

Comte is most often remembered now as an early practitioner of the history of science, and as an advocate of the application of scientific method to the explanation and prediction of social behaviour and its institutions. His own opinion of his contribution to society was rather more ambitious in its claims. The nature and scope of these claims are most briefly revealed in a letter that Comte wrote two months before his death in 1857:

> he would in the future sign all his circulars 'Le Fondateur de la religion universelle, Grand Prêtre de l'Humanité,' and he let it be known that his being

> would become more sacred than the Catholic pontiff's. The Pope was only a minister, but he, Auguste Comte, who had discovered the fundamental laws of human evolution, was the very personification of the Great Being.
>
> ([6.43], 267)

Comte's formal qualifications for this role were few. He had spent the years 1814–16 enrolled in the École Polytechnique in Paris, and had absorbed the faith in the power and utility of the current physical sciences which the school's highly distinguished staff were noted for instilling in their students. Expelled as a trouble-maker just before graduation, Comte lived by tutoring in mathematics until he became the secretary and, later, 'adopted son' of Comte Henri de Saint-Simon in 1817, a relationship that lasted until the two men quarrelled and separated a year before Saint-Simon's death in 1825. During those years, and up to early middle age, Comte read omnivorously and was influenced, as he reported, by a group of thinkers—Plato, Montesquieu, Hume, Turgot, Condorcet, Kant, Bonald, De Maistre among others—whose widely different views on many topics he pieced together in the thousands of pages that make up his two major philosophical works, the *Cours de philosophie positive* (1830–42, [6.3]) and *Système de politique positive* (1851–4, [6.1]).

In the last fifteen years of his life Comte read and thought little about the serious philosophical and sociological problems that occupied him earlier. Increasingly detached from scientific friends and philosophic debate by his growing confidence that he was a religious seer, bitter and hostile towards his estranged wife, financially dependent in that period on contributions from French and British well-wishers who included, in England, Sir William Molesworth, John Stuart Mill and George Grote, Comte devoted himself, firstly, to the deification of Clothilde de Vaux, the unhappy woman whom he had befriended and loved during the last year of her life and, secondly, to his detailed proposals in *Catéchisme positiviste* (1852) and the *Politique positive* for creating a society worthy of her character. The one person whose intellectual influence Comte refused to acknowledge was Saint-Simon, the hated collaborator whose ideas Comte had shared and extended, and whose career Comte was destined to duplicate in such unfortunate details as poverty, divorce, mental instability, advocacy of the messianic authoritarianism of a new religion of love and the conviction of being a divinely inspired leader. Of the proposal outlined in the *Politique positive* for the Catholic Church to be replaced by a 'corporate hierarchy' of philosophers with spiritual but not secular power, Mill was highly critical. The proposal required us to rely, he said, 'on this spiritual authority as the only security for good government, the sole bulwark against practical oppression'. The remainder of the book Mill went on to characterize, in a much quoted passage, as

> the completest system of spiritual and temporal despotism which ever yet emanated from a human brain, unless possibly that of Ignatius Loyola: a system by which the yoke of general opinion, wielded by an organized body of spiritual teachers and rulers, would be made supreme over every action, and as far as in human possibility, every thought, of every member of the community, as well in the things which regard only himself, as in those which concern the interests of others.
>
> ([6.49], 221)

How, then, had Comte's attempt to regenerate European society, by the application of the method and results of modern science, reached the stage of evoking such a response from a man who had contributed so greatly to the favourable reception of Comte's ideas in Britain? To answer this question is our major task here.

THE LAW OF THREE STAGES

It is best to begin with the problem that troubled Comte: the disharmony he believed to exist between the backward state of the European social systems with which he was familiar and the advanced state of the scientific knowledge to which he had been exposed in the École Polytechnique. During this period its staff included Gaspard Monge, the originator of descriptive geometry; Louis Poisson, still one of the most famous of mathematical physicists; Gay-Lussac as the professor of chemistry; Ampère, as a chief contributor to electrodynamics; Cauchy, a creator of the theory of functions among many other achievements; and Fresnel, the pioneer of optical research. These were some of the men whose work, both theoretical and applied, was transforming the intellectual and material culture of Europe and was, in Saint-Simon's and Comte's view, also making obsolete the political systems within which it was being conducted. In his two early essays 'A Brief Appraisal of European History' (1820) and 'Plan of the Scientific Operations Necessary for Reorganizing Society' (1822), Comte suggested that the partnership of Catholicism and feudalism that had ruled Europe from the eleventh century was approaching its end. The prosperity of nations and the organization of their intellectual life no longer needed either a military society or its theological superstructure. The rise of industry and the positive—or experience-based—sciences could, and would, replace war and metaphysics as the unifying forces of the new social order. The development of this order could be encouraged if scientists transformed the pursuit of politics into a theoretical science with practical applications, a science that used historical laws to explain and, above all, predict the course of our social existence.

This was the state of affairs for which Comte believed that he had discovered both the correct analysis and the remedy. In the 'Plan for Reorganizing Society' he wrote:

> The fundamental law which governs the natural progress of civilization rigorously determines the successive states through which the general development of the human race must pass. On the other hand, this law necessarily results from the instinctive tendency of the human race to perfect itself. Consequently it is as completely independent of our control as are the individual instincts the combination of which produces this permanent tendency.
>
> ([6.13], 146)

The 'instinctive tendency' referred to here is the tendency of human beings to make full use of their genetic capacities by means of a social life that they develop in a lawlike fashion, but of whose orderly sequence they are largely unaware. People have reached their natural goals and satisfied their innate desires by evolving, over a long history, a

social life in several stages. This conclusion about historical stages is found throughout the eighteenth century. From Vico's description of the necessary course of human history to the later multi-stage views of economic advancement held by Turgot, Quesnay, Mirabeau, Smith, Condorcet and Robertson, interest concerning possible regularities of evolutionary succession in human civilization was intense, and schemes of large-scale historical stages were numerous. By the time that Comte 'discovered' his Law of Three Stages he was familiar with the earlier and similar schemes adapted by Condorcet from Turgot's 'Second Discourse on Universal History' (1751) and by Saint-Simon from Condorcet. Turgot had discerned three stages in the history of human intellectual development:

> Before men were conversant with the mutual interconnection of physical effects, nothing was more natural than to suppose that these were produced by intelligent beings, invisible and resembling ourselves. Everything that happened…had its god…
>
> When the philosophers had recognised the absurdity of these fables…the idea struck them to explain the causes of phenomena by way of abstract expressions like *essences* and *faculties:* expressions which in fact explained nothing, and about which men reasoned as if they were *beings*, new gods substituted for the old ones. Following these analogies, *faculties* were proliferated in order to provide a cause for each effect.
>
> It was only much later, through observation of the mechanical action which bodies have upon one another, that men derived from this mechanics other hypotheses which mathematics was able to develop and experiment to verify.
>
> ([6.57], 102)

In Comte's version, Turgot's scheme of three stages becomes a 'great fundamental law' that governs by 'invariable necessity' the entire development of human intelligence in its different fields. Comte's law is that each of our principal conceptions, each branch of our knowledge, passes in turn through three different theoretical stages: the theological, or fictitious; the metaphysical, or abstract; the scientific, or positive. These are three distinct and opposed forms of philosophical thinking of which the first is a necessary point of departure, the second merely transitional, and the third fixed and final. In the theological stage, the human mind, enquiring into the inner nature of things—the origin and purpose of the impressions that affect us—supposes these phenomena to be the result of direct and continuous action by supernatural agents. In the metaphysical stage, which for the most part is only a simple modification of the first, the supernatural agents are replaced by abstract forces, personified abstractions, inherent in everything, and conceived of as capable of generating and explaining all observed phenomena by referring each one to a corresponding force. In the positive stage the human mind attempts to discover, by combining reason and observation, the laws of phenomena: that is, their invariable relations of succession and similarity. The explanation of facts is simply the establishment of a connection between particular phenomena and some general facts whose number tends to diminish with the progress of science. The perfection of the positive system, towards which it tends unceasingly, but which it will probably never

reach, would be the ability to exhibit all the different observable phenomena as particular cases of a single general fact such as gravitation ([6.8], I, 21–2)

In the *Cours*, Comte advances three kinds of evidence in support of his law. The first is that the positive sciences of the present day still show traces of the two earlier stages. The second is that since the starting point in the education of the individual is the same as that of the species, the principal phases of both are the same, and hence, with respect to the more important ideas, each person is a theologian in childhood, a metaphysician in youth and a scientist in adulthood. The third and most important piece of evidence is that in every age human beings have needed theories with which to connect events, but at the outset of their mental development could not possibly have based their theories on the results of observation. Because a scientific theory must be founded on the observation of phenomena, and they in turn require a theory so that we can notice, connect and retain them, the human mind would have been enclosed in a vicious circle, without any means of escape, if it had not been for the spontaneous development of theological conceptions which provided a primitive solution—a solution that was improved only to a limited extent in the metaphysical era. 'The fundamental character of positive philosophy,' Comte writes, 'is that of regarding all phenomena as subject to invariable natural laws whose accurate detection, and reduction to the smallest number possible, is the goal of all our efforts. Because they are completely inaccessible, it is senseless for us to seek what are called 'causes', whether they be first causes or final causes'. Thus positive philosophy eliminates the useless search for the 'generating causes of phenomena', and tries only 'to analyze exactly the circumstances of their production, connecting one to the other by the normal relations of succession and similarity' ([6.3], I, 25–6)

In objecting to the search for 'generating causes'—or indeed causes in general—Comte is giving a rather limited and special use to the term 'causes'; and he is relying on a simple form of the verification principle with which to exclude such causes. In a genuine science, he says, when we try to explain an obscure fact

> we proceed to form a hypothesis, in agreement, as far as possible, with the whole of the data we are in possession of; and the science, thus left free to develop itself, always ends by disclosing new observable consequences, tending to confirm or invalidate, indisputably, the primitive supposition.
>
> ([6.11] I, 243)

However, when we go on to speculate about causes that are unobservable in principle, such as 'chimerical fluids causing planetary motions', we are introducing factors that are 'altogether beyond the limit of our faculties' and must always remain so.

> What scientific use can there be in fantastic notions about fluids and imaginary ethers, which are to account for the phenomena of heat, light, electricity and magnetism?… These fluids are supposed to be invisible, intangible, even imponderable, and to be inseparable from the substances which they actuate. Their very definition shows them to have no place in real science; for the

> question of their existence is not a subject for judgment: it can no more be denied than affirmed: our reason has no grasp of them at all.([6.11], I, 243)

These unobservable causes explain nothing. To use the idea of an unobservable fluid expanding between molecules as an explanation of the expansion of bodies when heated is to use one mystery to account for another. When we employ such fictitious entities there is a serious risk that sooner or later we shall take them to be real. They are simply examples of the metaphysical forces of whose emptiness we have already been warned ([6.11], 1:244–5).

THE CHARACTER AND ORGANIZATION OF THE SCIENCES

Very little of Comte's Law of Three Stages has escaped criticism. In part, Comte encouraged this by his claims concerning its philosophical importance and the major role that he took it to play in his system. True, he emphasized that the different sciences moved through the three stages at different rates and at different times, and that some sciences—mathematics and astronomy, for example—were already in the positive stage whereas physics, chemistry and biology were only on the verge of entering it. Nevertheless, Comte left the status of his law as obscure as had the many previous advocates of such laws of large-scale, inescapable and fixed stages of social evolution. In his later work it became clear that he believed that the law provided the basis of his social reforms: they, after all, were designed to entrench in the new society the methods and outlook of the final, and positivist, stage of intellectual development. It was much less clear whether Comte's law was merely a classification of three types of explanatory theories, and their accompanying social systems, or whether the law was a testable sociological hypothesis about the three historical phases of human thought. The kinds of evidence that Comte himself produced in support of his law, and the fact that he took it to be a truth that he had discovered, indicate that he believed the law to be the most general and basic of all sociological propositions. In this interpretation it has met with many objections. John Stuart Mill produced a number of them in *Auguste Comte and Positivism* (1865). It was unlikely, he thought, that mathematical theorems were ever thought to depend on the intervention of divine or metaphysical forces to make them true. ([6.47], 47) Nor was it necessary for religious belief to be restricted to the theological and metaphysical stages, for a positive scientist can believe that God always rules by means of fixed laws, and this satisfies the chief characteristic of the positivist phase, namely the belief that every event, as part of a 'constant order', is 'the invariable consequent of some antecedent condition'. So Comte might be mistaken in claiming that every event has a purely natural antecedent condition ([6.47], 15). He was certainly mistaken, says Mill, in not recognizing that in every field some conclusions have always been drawn from observation and experience. For that reason, some portion of every discipline must always have been in the positivist phase ([6.47], 51). However, here Mill's complaint is misguided. As early as 1825 Comte had written: 'In truth, man has never been entirely in the theological condition. Some phenomena have always existed, so simple and regular, that, from the first, he could only consider them as subjected to natural laws' ([6.13], 183)

Later critics have rejected the very conception of a law of social or intellectual evolution. Karl Popper, for example, has argued that all such ‘laws’ are simply trends based on past experience and then projected, unjustifiably, into the future. They are summaries of previous events but offer no basis for reliable prediction. Because these ‘laws’ are actually trends, and thus not accompanied by qualifications that identify the conditions under which the generalizations can be applied, unexpected changes in local conditions can alter the trends and make them inapplicable ([6.53], 105–30) So embarrassing counter-examples need to be warded off by various defences: as being survivals from the past, as having skipped over crucial stages, as having been subject to unusual rates of change. These devices, says Popper, are necessary because the trend-statements themselves can give us no clue as to why the past events to which they refer have ceased to occur; and since the trends are supposed to be the fundamental laws of the system there is no additional law available for explaining why they sometimes do not work. Comte, of course, believed that his law was satisfactory, and he spent a great deal of time and energy in working out what he took to be its ramifications within the various sciences. He also thought that the law made necessary the adoption of certain philosophical principles concerning the nature, organization and application of scientific knowledge. As a result of holding these beliefs, Comte could not agree that the Law of Three Stages was defective without also admitting that its supposed consequences might be mistaken. A large portion of his system would then be exposed to threat.

Attached to Comte’s law is a hierarchical classification of the six basic sciences arranged in the order of their decreasing simplicity, generality and abstractness—or in the order of their increasing complexity, specificity and particularity. First is mathematics; it is followed by physics, chemistry, physiology (biology), and last, social physics, for which Comte later invented the name ‘sociology’. Each succeeding science relies on some of the conclusions and laws of the earlier sciences, but the later science cannot be derived from them and they are independent of it. It is correct to refer to the sciences as ‘earlier’ and ‘later’ because their hierarchical order is the approximate order in which they developed historically. It is also the order of their decreasing precision, and thus of the steps by which human beings advanced from the more precise but simple disciplines to the less precise but increasingly complex fields. More significantly, says Comte, this scheme shows us that there can be no rational scientific education, and hence no great improvement of scientific knowledge, until each science is studied with a knowledge of all the sciences on which it is dependent.

> Physical philosophers cannot understand Physics without at least a general knowledge of Astronomy; nor Chemists without Physics and Astronomy; nor Physiologists, without Chemistry, Physics, and Astronomy; nor, above all, the students of Social philosophy, without a general knowledge of all the anterior sciences.
>
> ([6.11], 1:32)

Moreover, the various sciences must be studied in their proper order. Otherwise, the student will not be able to use the indispensable methods and results of the simpler discipline in attempting to master the succeeding and more complex science. For this

reason the practice of sociology will require the longest, most arduous, preparation and the outstanding ability, and disinterestedness, needed to make use of it.

Comte was by nature and practice an inveterate and indefatigable classifier. Nevertheless, he gives two rational grounds for producing his scheme of classification. One is that by exhibiting the objectives, methods and limits of the different sciences, and their interrelations, we can improve the organization of scientific research. For new work, especially that requiring several disciplines, will be suggested by various features of the general scheme and be fitted into it appropriately. We shall not, for example, waste energy in grappling with topics such as psychology for which there is, and can be, no positive science. The other ground is that the scheme aids us to renovate our system of theoretical education; the student learns the general concepts, procedures and conclusions that belong to the scientific method itself while also learning how they are exemplified in the various sciences. For until 'a certain number of general ideas can be acknowledged as a rallying point of social doctrine, the nations will remain in a revolutionary state'. But once 'first principles' are agreed upon, 'appropriate institutions will issue from them…for the causes of disorder will have been arrested by the mere fact of agreement' and a 'normal state of society' will ensue. ([6.11], 1:16). The disorder to which Comte refers was that marked both by the July revolution of 1830 in which the French king, Charles X, was forced to abdicate in the face of middle-class opposition, and by the proletarian riots during the turbulent years of his successor, Louis Philippe, until he abdicated during the February revolution of 1848.

The sociological significance of Comte's law is that he took each of its three stages to be closely intertwined—for he could not have said causally connected—with the three phases into which he divided European history, phases characterized by the relative strength during each period of the temporal and spiritual (religious or philosophical) authorities. Society in the first phase, dominated from the fourth to the fifteenth century by Catholicism and feudalism, was organized, in its economic structure, for war, and in its intellectual structure for the need of a priestly caste, with its theological knowledge, to share power with the nobles of a military court. The latter demanded 'passive obedience' from the common people, and the former required their 'mental submission'. In the second or metaphysical phase, the Protestant subversion of Papal authority replaced blind faith with a limited degree of intellectual freedom and political authority for the educated or the wealthy. At the same time, free cities, the bourgeoisie and science began their development and interacted with the effects of the Protestant Reformation. In consequence, we are now in the modern phase of industrialism, positive science and political revolutionaries seeking legislative, administrative and social power. Our technological and scientific advances must be matched, therefore, by new forms of social and political authority. These new forms are what Comte believes that he, and perhaps he alone, can offer. He does so in his second major work, the *Système de politique positive*, after having described in the *Cours* the scientific method and knowledge that are to culminate in the positivist society.

However, Comte devoted only two introductory chapters (or lessons), and one later chapter, of the entire sixty in the *Cours* to basic problems in the philosophy of science. These include the scientific status of psychology, the nature of scientific explanation and, of course, the character, scope and application of the Law of Three Stages. Comte

rejected the study of psychology because he took it to rely on unverifiable introspection of the intellectual processes and the passions. To this he objected that 'there can be nothing like scientific observation of the passions, except from without, as the stir of the emotions disturbs the observing faculties more or less'. Nor can there be an 'intellectual observation of intellectual processes. The observing and observed organ are here the same, and its action cannot be pure and natural'. The reason, for this, he thinks, is that 'In order to observe, your intellect must pause from activity; yet it is this very activity that you want to observe'. Unless your intellect can pause, it cannot observe. But if it does pause, there is nothing left to observe ([6.11], 1:12). Of this argument John Stuart Mill complained, many years after his initial enthusiasm for Comte's views had waned, that it is 'a fallacy respecting which the only wonder is that it should impose on anyone'. For if we can learn about the mental life of other people only by observing their behaviour, how can we ever interpret it unless we are allowed to use our knowledge of our own feelings and thoughts? We cannot obtain that knowledge merely by observing our own behaviour. In fact, we obtain self-knowledge both by memory and by our ability to attend to 'a considerable number of impressions at once'. Comte's wish to replace introspection with observation of behaviour, including physiological reactions, neglects the impossibility of then correlating that behaviour with what on his own view is our inaccessible mental life.

Mill recognizes that Comte believes that all mental states are produced by—invariably succeed—states of the brain, and hence that the regularities of succession among mental states necessarily depend upon similar regularities among brain states. Nevertheless, even if this is correct, Mill argues, mental regularities cannot be deduced at present from physiological regularities. We are able to investigate the latter only because we have a better knowledge of the former ([6.47], 63–4). Mill could have added what he also knew: that for all Comte's argument shows, the actual relation between mental states and brain states is the reverse of what Comte believes, and that the latter invariably follow on the former. In any case, the fact that one invariably follows on the other does nothing to make the later regularity either impossible to observe or in some way fictitious. The temporal relation, if any, between the two kinds of regularity is irrelevant to their observability—except that if one of them were unobservable in principle we should find it difficult to establish the temporal relationship.

Comte's dismissal of psychology as a genuine science was not based on the scientific evidence available to him, and the rejection led him to neglect describing what Mill did describe in Book VI of *A System of Logic* (1843), the nature of the relationship between psychological and sociological phenomena—between 'the operations of mental life' and the genuine, or irreducible, laws of society of which Comte was the tireless herald. Comte did assert that the explanation of individual human actions could not be logically derived from supposed 'laws of individual life', whether these laws were psychological or otherwise. For individual actions are the outcome of combined biological and social factors that accumulate over time, and thus create the societies to which all actions of individual people owe their existence. Because such factors underlie and produce the psychological features of every person, it is only the fundamental sociological laws that permit us to explain those features. The laws do so by explaining the character, origin and changes of particular types of societies and of civilization taken as a whole. These conclusions, popular throughout the nineteenth century, were one answer to the

widespread demand by thoughtful people during that period for a new scientific certainty to replace their lost religious beliefs. Certainly, the interest of both Comte and Mill in social reform and laws of social change was motivated by their common need to be assured that civilization was proceeding at a reasonable pace on a worthwhile journey. But Mill disagreed with Comte in two important respects: firstly, in believing that psychological laws were a necessary, though not sufficient, condition for the explanation of social phenomena; and secondly, in being convinced that there was not, and could not be, one ultimate law of nature concerning the development of civilization. On this latter point Mill wrote that it is a misconception to suppose

> that the order of succession which we may be able to trace among the different states of society…could ever amount to a law of nature… The succession of states of the human mind and human society cannot have an independent law of its own; it must depend on the psychological and ethological laws [of character formation] which govern the action of circumstances on men and of men on circumstances. ([6.48], 2:914)

In objecting to Comte's belief that there can be a law of social evolution, and that he had formulated it in his Law of Three Stages, F.A.Hayek complained that it is 'a curious feature of the Comtean system that this same law which is supposed to prove the necessity of the new science is at the same time its main and almost sole result' ([6.34], 179) This verdict is somewhat harsh. It is true that Comte formulated few, if any, testable social laws—ordinary laws of the constant concomitance, whether of coexistence or succession, between identifiable social factors. That was not his aim. Instead, he was trying to describe the need for a scientific study of social life, the ways in which the methods of the natural sciences could be used to establish a social science, and the general form that its empirical laws would take as the result of genuinely scientific investigation. Comte did not, and could not correctly, claim to be practising empirical sociology, for that discipline had yet to be created. He believed that the task of the sociologist of the future would be to discover social laws that presupposed the existence of biological laws without being derivable from them—social laws that implied various regularities of national and individual character, including those of mental life. Such laws, he reiterated in the last three volumes (lessons 46–60) of the *Cours*, would take account of two facts: the cumulative effect on people's behaviour of social factors over time; and the way in which social institutions and customs are always parts of a social system and operate as an 'ensemble' of interrelated factors in much the same fashion as do the organs of an animal's body.

Each law of observed phenomena offers us an explanation because every such law connects together under one heading a variety of otherwise disparate facts. Thus the theory of gravitation explains planetary 'attraction' by showing that it conforms to 'the ordinary phenomena which gravity continually produces on the surface of our globe'. The theory brings together

> under one head the whole immense variety of astronomical facts; exhibiting the constant tendency of atoms towards each other in direct proportion to the

> squares of their distances; whilst the general fact itself is a mere extension of one which is perfectly familiar to us, and which we therefore say that we know; the weight of bodies on the surface of the earth. As to what weight and attraction are, we have nothing to do with that, for it is not a matter of knowledge at all. Theologians and metaphysicians may imagine and refine about such questions; but positive philosophy rejects them.
>
> ([6.11], 1:6)

The reason they are rejected, says Comte, is that the greatest minds have been able to define the two properties only in terms of each other, so that terrestrial attraction is only weight and weight is nothing more or less than terrestrial attraction. Thus, according to Comte, phenomena are observed facts, and facts can be either specific events and processes or general laws. Since weight and attraction are not directly observable, they are not verifiable scientific facts; they are to be classified with ether and heat-fluid as imaginary causes. However, Comte does not make this complaint of the Newtonian theory that atoms attract each other as the squares of their distances. Nor does he make it when discussing indirect observations of the earth's size. His failure to do so reveals the difficulties that he creates for his system by not distinguishing between things that are observable only in principle and those that are observable in practice. As a result, he has to rely on common sense for deciding which events and processes are observable in any given field of science. For this reason, he has trouble in distinguishing between metaphysical and scientific entities, and hence between questions that can be given a scientific answer and those for which this is impossible. So his reliance on the possibility of future verification to discriminate scientific hypotheses from metaphysical ones is unsupported, for he gives no developed account of any criterion of scientific verifiability except, as we shall see, to admit entailments that are unobservable but lead to observable consequences. He leaves unanswered the question 'what is to count as an observation in science?' Yet his Law of Three Stages assumes that he can discriminate between the stage of metaphysical explanation and that of positive scientific explanation.

These problems are both a result and a source of Comte's ideas about causes. As early as 1840, William Whewell pointed out that hypotheses about unobservable causes were often essential in scientific enquiry. How, for example, he asked, 'could the phenomena of polarization have been conceived or reasoned upon, except by imagining a polar arrangement of particles, or transverse vibrations, or some equivalent hypothesis?' Causes could not simply be metaphysical entities ([6.59], 2:268). Mill's criticism of Comte on causes was rather different. Comte overlooked the difference, Mill complained, between conditional and unconditional regularities of phenomena. The alternation of night and day is an apparently invariable sequence but it is not a natural law, for it is merely the result of a genuinely invariable regularity, or unconditional sequence, that of the earth's rotation around the sun.

> The succession of night and day is as much an invariable sequence, as the alternate exposure of opposite sides of the earth to the sun. Yet day and night are not the causes of one another; why? Because their sequence, invariable in our experience, is not unconditionally so: those facts only succeed each other,

> provided that the presence and absence of the sun succeed each other.
>
> ([6.47], 57–8)

Unconditional regularities, ones in which the antecedent always will be followed by the consequent 'as long as the present constitution of things endures', are laws of causation. Conditional regularities are those in which, as a mere fact of our experience, 'the antecedent always *has* been followed by the consequent'. They are Comte's laws or regularities of phenomena. They simply record what has happened to date, and thus offer no basis for the explanation, prediction and control of phenomena that is so highly valued in Comte's system ([6.47], 57–8).

HYPOTHESES AND SOCIAL LAWS

Despite his difficulties with the notions of observation, cause, verification and law of nature, Comte was one of the earliest social thinkers to stress the indispensability in social scientific work of the appropriate use of theories and hypotheses. In his essay 'Philosophical Considerations on the Sciences and Savants' (1825), he wrote:

> Unless man connects facts with some explanation, he is naturally incapable not merely of combining and making deductions from them, but even of observing and recollecting them. In a word, it is as impossible to make continuous observations without a theory of some kind, as to construct a positive theory without continuous observations.
>
> ([6.13], 185)

Some years later, in the *Cours,* Comte expanded on this view. He suggested that without the help of conjectures (or imaginative hypothesis) we could use neither deduction nor induction:

> Neither of these methods would help us, even in regard to the simplest phenomena, if we did not begin by anticipating the results, by making a provisional supposition, altogether conjectural in the first instance, with regard to some of the very notions which are the object of the inquiry. Hence the necessary introduction of hypotheses into natural philosophy. The method of approximation employed by geometers first suggested the idea; and without it all discovery of natural laws would be impossible in cases of any degree of complexity; and in all, very slow.
>
> ([6.11], 1:241)

Comte's belief in the importance of hypotheses and theories in scientific work leads him to comment on the relatively small role that observation plays in some astronomical investigation:

> The few incoherent sensations concerned would be, of themselves, very

> insignificant; they could not teach us the figure of the earth, nor the path of a planet. They are combined and rendered serviceable by long-drawn and complex reasonings; so that we might truly say that the
> phenomena, however real, are constructed by our understanding.
>
> ([6.11], 1:151)

So in contrast to his own simpler ideas about the limits of observation, Comte here recognizes the need both for direct observations and for their unobservable entailments, concluding that 'the perpetual necessity of deducing from a small number of direct measures, whether angular or horary, quantities which are not themselves immediately observable, renders the use of abstract mathematics indispensable' ([6.11], 1:151). Of course, this recognition of the necessity of using unobservable quantities makes the exclusion of unobservable metaphysical causes more difficult, for a general criterion that distinguishes one from the other has now to be found. This was the task undertaken much later by the logical positivists of the Vienna Circle, and in England by A.J.Ayer, in the form of a search for a reliable principle of verification that would separate sense from nonsense, and separate theoretically necessary, but fictional, entities from unobservable but actual ones.
